Corrosion test	Temperature and duration	70 ± 1 °C, 24h												
	Appearance	The rubber shall not corrode the metal with which it is in contact nor shall the rubber become sticky. However, changes in metal surface color shall not be judged as corrosion.												

Notes 1) Instantaneous values have been used.

2) For details, see the appendix of JIS B 2401-1.

3) Not standardized in the JIS.

(2) Selection of O-ring material

O-rings have contact with substances to be sealed. Therefore, material should be chemically stable to such substances.

Table 2.3.2 below lists the substances with which each rubber material can remain stable. Consult JTEKT for further details.

◎ : Resistant to the substance
○ : Resistant to the substance except under extreme conditions
△ : Not resistant to the substance except under specific favorable conditions
× : Not resistant to the substance

Table 2.3.2 O-ring rubber materials and their stability to fluids

Features		• The most common material • High resistance to oil, abrasion and heat • Hardness: A70	• Harder and higher pressureresistance than NBR-70-1 (Class 1-A rubber) • Same properties as NBR-70-1 (Class 1-A rubber) in other respects • Hardness: A90	• High resistance to fuel oils, such as gasoline, light oil and kerosene	• Superior to the NBR-70-1 in terms of ozone resistance, oil resistance, and heat resistance • Hardness: A70	• Superior to the HNBR-70 in terms of hardness and resistance to pressure • Same properties as the HNBR-70 in other respects • Hardness: A90	• Highest resistance to animal oil and vegetable oil, such as brake fluid	• High resistance to high and low temperature • Excellent self-restoration after compression, under a wide temperature range	• Highest resistance to oils, chemicals, and heat • Useful over a wide temperature range • Hardness: A70		• Harder and higher pressureresistance than FKM-70 (Class 4-D rubber) • Same properties as FKM-70 (Class 4-D rubber) in other respects • Hardness: A90	• Superior to nitrile rubber in terms of heat resistance and oil resistance • Especially resistant to high-temperature oil	• Superior in ozone resistance, heat resistance and electrical insulation resistance • Hardness: A70		• Harder and higher pressureresistance than EPDM-70 (Class 5 rubber) • Same properties as EPDM-70 (Class 5 rubber) in other respects • Hardness: A90

＊Not standardized in the JIS.

(3) Selection of cross section diameter

When sealing fluid with O-ring, design the O-ring so that the depth of groove for fitting it is smaller than the thickness of the O-ring to compress (squeeze) it (provide compression amount). Determine this compression carefully, because O-rings may become permanently deformed if squeezed excessively, thus deteriorating sealing performance.

Generally, the compression rate of an O-ring should be between 8 % and 30 % in ring cross section diameter (the lower limit of 8 % for sufficient sealing performance and the upper limit of 30 % for limited compression set.).

Fig. 2.3.1 shows the relation between O-ring cross section diameter and compression set.

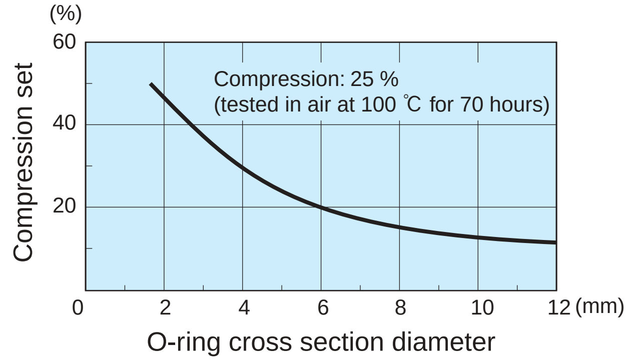

Fig. 2.3.1 Relation between O-ring cross section diameter and compression set

Larger cross section diameter offers more stable sealing performance. As shown in Fig. 2.3.1, when the O-ring compression rate is constant (25 % in the figure), the larger cross section diameter shows the smaller the compression set. Larger cross section diameter is advantageous in that it can accommodate errors in installation dimensions as well.

In dynamic-sealing applications, larger cross section diameter is less likely to twist during service or during installation. The largest cross section diameter possible should be selected providing it can fit in the available space.

2.4 O-ring technical principles

(1) Sealing mechanism

Fig. 2.4.1 shows how O-ring can be deformed under pressure.

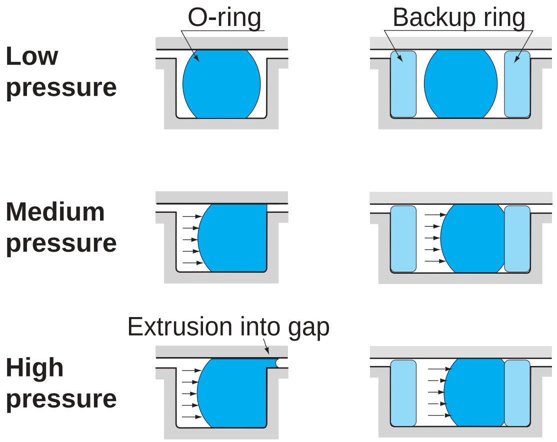

Fig. 2.4.1 O-ring deformation under pressure

O-ring installed in a groove with compression (compression rate) of 8 % to 30 % provides a self-seal by its elasticity when the pressure is low.

When operation pressure is higher, the O-ring is pressed against one side of the groove, providing better sealing. However, under extremely high pressure, the O-ring partially is pressed out from groove into the gap and may be damaged, and deteriorated sealing performance.

For such high-pressure applications, one or two backup rings should be applied to prevent extrusion into gap.

(2) Backup ring

Backup rings are used for dynamic sealing and for static sealing of cylindrical surface.

Two backup rings should be installed on both sides of O-ring when high pressure is put on the O-ring in two directions. One backup ring is installed on low pressure side of O-ring when high pressure is applied in one direction.

Even when extrusion into gap does not occur under low pressure, backup rings are recommended because they can extend O-ring service life by preventing O-ring tearing or damage, which are the most common causes of O-ring failures.

One each backup ring is installed on both sides of O-ring normally (total is two backup rings). However, if space does not allow this, one backup ring should be installed on the lower-pressure side.

The O-ring extrusion varies depending on applied pressure, O-ring hardness and gap amount on the cylindrical surface. Refer to Fig. 2.5.2, "O-ring extrusion limit values," when using backup rings.

Backup rings of endless design (T3) are the most advantageous in the prevention of extrusion into the gap. However, those of spiral design (T1) and bias-cut design (T2) can be more easily installed.

Backup rings of spiral design are most commonly used.

Use backup rings of spiral design with a pressure between 10 MPa and 20 MPa. If the operating temperature exceeds 100˚C, use backup rings of spiral design with a pressure of less than 10 MPa.

Backup rings of bias-cut design excel at protecting O-rings at pressures ranging from 15 MPa to 20 MPa and above.

Backup rings of endless design are suited to use with pressures exceeding 25 MPa and temperatures exceeding 135˚C.

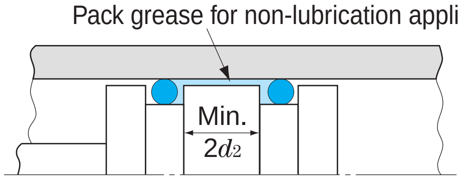
All Koyo backup rings are made from tetrafluoroethylene (PTFE) resin, which is chemically stable to all media under a wide range of temperatures and is resistant to corrosion.

(3) O-rings for dynamic sealing (Reciprocal movement)

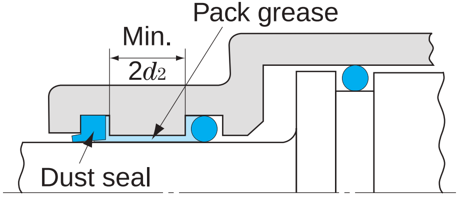
When fitting groove is provided on the piston, use two O-rings to ensure improved service life and sealing performance (Fig. 2.4.2). Pack grease between the two O-rings in a non-lubrication application. Recommended grease is lithium soap base with NLGI No. 2.

When fitting groove is provided on the cylinder, use a dust seal as well and pack grease between the O-ring and dust seal.

Groove on piston



Groove on cylinder



d_2: O-ring cross section diameter

Fig. 2.4.2 Typical installation of O-ring for dynamic sealing

For the installation of O-rings on cast cylinders or for low-friction dynamic-sealing applications, consult JTEKT.

(4) O-rings for static sealing of cylindrical surface

When O-ring is used under low pressure with the compression rate close to the minimal of 8 %, the fitting groove accuracy affects sealing performance so much, so that the groove accuracy should be controlled at the same level as the fitting groove of dynamic sealing.

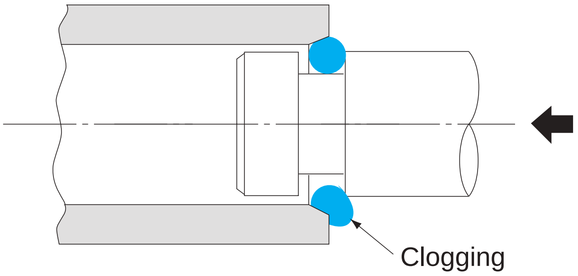


Fig. 2.4.3 O-ring slack and clogging

Even when an O-ring is selected in accordance with the dimensional table values and groove dimensions, the O-ring may become slack due to dimensional deviation and installation method, which may be caused by the reason why the O-ring is unduly caught between the groove and housing (Fig. 2.4.3).

Especially large size O-rings must be installed with care to avoid ring slack.

To prevent ring slack for the ring size of 150 mm or more, a slightly smaller size O-ring may be used rather than one that exactly fits the groove dimensions after determining the O-ring compression amount carefully.

Consult JTEKT for this method.

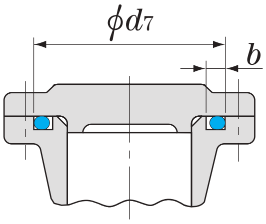
(5) O-rings for static sealing of flat surface

Determine the O-ring compression amount to be slightly larger than in other applications.

If the O-ring is exposed to internal pressure, the O-ring outside diameter should be determined, according to groove diameter ϕd_7. When the O-ring is exposed to external pressure, O-ring bore diameter should be determined according to groove diameter ϕd_8 (see Fig. 2.4.4 (a) and (b)).

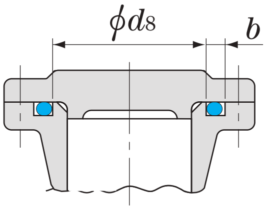
(a) For internal pressure

d_7: Groove O.D
b: Groove width



(b) For external pressure

d_8: Groove I.D
b: Groove width



(c) For internal pressure

B: Seat width

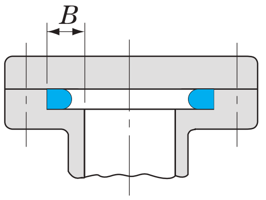


Fig. 2.4.4 Fitting groove for static sealing of flat surface

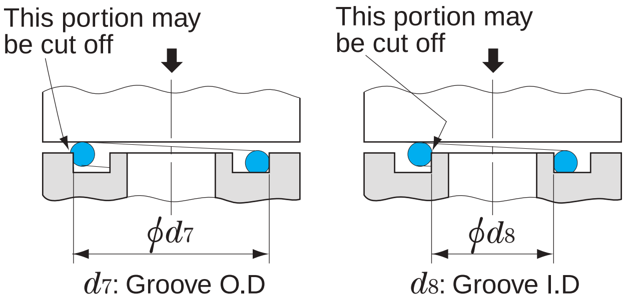
If the O-ring is exposed to pressure in one direction, the groove side face on the high-pressure side can be eliminated for easy machining (Fig. 2.4.4 (c)).

In this case, dimension B should be greater than the minimum of the groove width b (Fig. 2.4.4(a)) used in flat surface static-sealing application.

In the case of internal-pressure applications and O-ring size is small (30 mm or less), groove outside diameter ϕd_7 should be 0.2 to 0.3 mm larger to ensure correct O-ring installation.

In the case of thin O-ring (cross section diameter 3 mm or less) of large size (150 mm or more), it may be installed on the groove incorrectly and partially protruding from the groove, which results in cutting off of O-ring. Such a situation must be avoided. Use thicker O-ring to prevent such a protrusion (Fig. 2.4.5).



For internal pressure **For external pressure**

Fig. 2.4.5 O-ring protrusion

(6) O-rings for vacuum flanges

In vacuum applications, O-rings are used to seal in gases. Therefore, fitting groove surfaces should be carefully machined and finished.

To select a suitable rubber material to meet vacuum grade, consult JTEKT.

(7) Installation in triangular groove

When O-ring is installed on the interior angle on a shaft or flange, the A dimension of the triangular groove should be 1.3 to 1.4 times of the O-ring cross section diameter (Fig. 2.4.6).

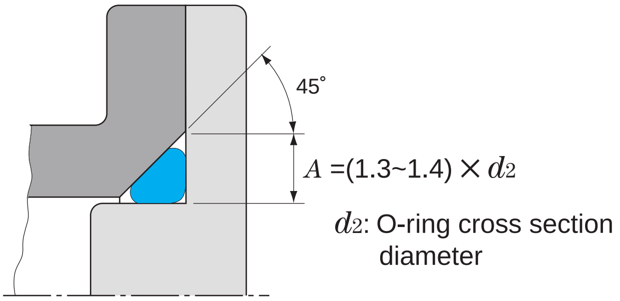


Fig. 2.4.6 Triangular-groove dimensions

2.5 Fitting groove design for O-ring

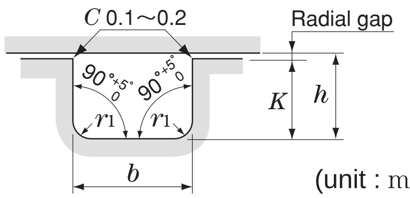
(1) Compression amount and compression rate

Table 2.5.1 lists the JIS-standard of O-ring Compression amount and compression rate.

See dimension table for each groove dimensions corresponding to O-ring number.

Compression amounts of standards other than JIS are shown in respective dimensional tables.

Fig.2.5.1 shows the details of relation between the shape of groove and the compression amount and compression rate.



(unit : mm)

1) Groove depth K

Determine dimension h to obtain O-ring compression rate between 8 % and 30%.

Determine the radial gap by the consideration that the double radial gap (gap in diameter) should be less than the value shown in Fig. 2.5.2.

Compression amount = $d_2 - h$

Compression rate = $\frac{d_2 - h}{d_2}$ x 100 (%)

d_2 : O-ring cross section diameter

2) Groove width b

Determine groove width by the consideration that O-ring should not occupy more than 90 % of the groove space.

Occupancy percentage = $\frac{\pi \times (d_2 / 2)^2}{b \times h}$ x 100 (%)

Fig. 2.5.1 Relation between shape of groove and compression amount (rate)

Table 2.5.1 O-ring compression amount and compression rate

O-ring number	O-ring dimensions, mm			Compression amount and compression rate

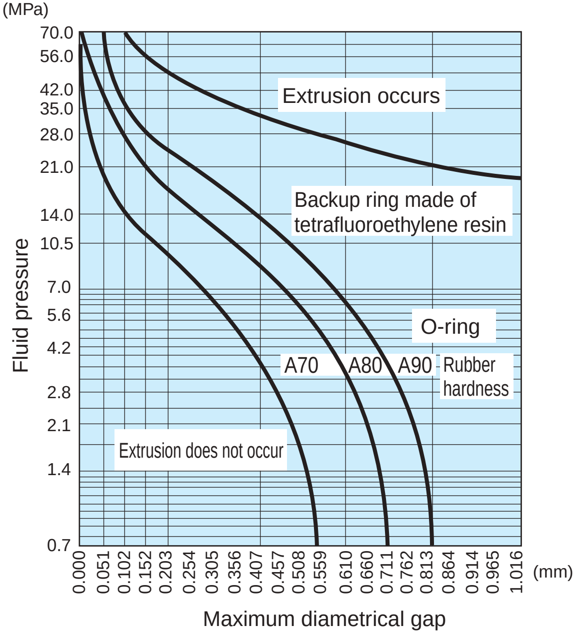
G185 ~ G300		184.3 ~ 299.3									

(2) Extrusion into gap from fitting groove

The O-ring and backup ring extrusion into the gap from the fitting groove on cylindrical surfaces is mainly related to the gap amount of the cylindrical surface.

Pressure of fluid to be sealed or O-ring hardness also influence.

Fig. 2.5.2 shows the relation between these factors.



<O-ring test conditions>
1. Without backup ring
2. Expansion of cylinder inner diameter due to internal pressure of cylinder is not included.
3. These results were obtained after 100 thousand cycles at 2.5 Hz between zero pressure to the pressure specified in the diagram.

Fig. 2.5.2 O-ring and backup ring extrusion limit values

Expansion of cylinder inner diameter due to internal pressure of cylinder is not taken into consideration for the gap in the diagram above. If any expansion of the cylinder inner diameter may occur, the gap should be 75% of the values shown in the diagram, taking expansion of the gap into consideration.

Also, if an O-ring exceeds the values of the gaps in the figure above, use a backup ring.

(3) Fitting groove surface roughness

Fitting groove surface should be finished as specified in Table 2.5.2 below for the O-ring to have sufficient sealing performance and long service life, and to minimize frictional resistance.

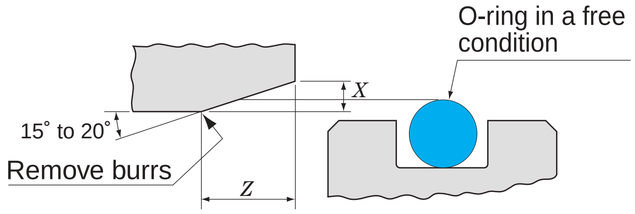
Table 2.5.2 O-ring fitting groove surface roughness

Location	Purpose	Type of pressure		Surface roughness	
				µm Ra	µm Rz
Groove side and bottom	Static sealing	Constant	Flat surface	3.2	12.5
			Cylindrical surface	1.6	6.3
		Pulsating			
	Dynamic sealing	With backup rings			
		Without backup ring		0.8	3.2
O-ring sealed contact surface	Static sealing	Constant		1.6	6.3
		Pulsating		0.8	3.2
	Dynamic sealing	–		0.4	1.6
Chamfer area				3.2	12.5

(4) Chamfer of installation location

Provide chamfers on all edges of the cylinder and piston rod to prevent O-ring damage during installation, as shown in Table 2.5.3.

Table 2.5.3 Chamfer of O-ring installed area



unit : mm

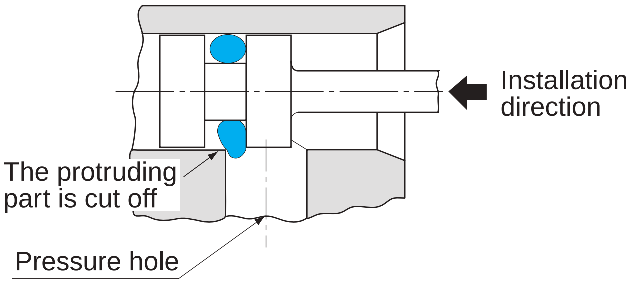
O-ring cross section diameter		X (min.)	Z [1]	
Over	Up to		At 15°	At 20°
—	2.4	0.9	3.4	2.5
2.4	3.5	1.1	4.1	3
3.5	5.7	1.3	4.9	3.6
5.7	8.4	1.5	5.6	4.1

Note 1) Dimension Z is shown when dimension X is minimum.

When O-ring is used on piston seal, do not provide a pressure hole on the area on which the O-ring slides.

If the pressure hole must be installed in the area the O-ring is slid, chamfer the pressure hole (Fig.2.5.3). For the chamfering amount, see the Table 2.5.3.

When the pressure hole is not chamfered:



When the pressure hole is chamfered:

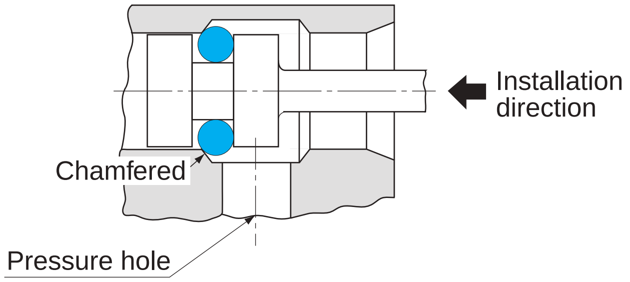


Fig. 2.5.3 Chamfer of pressure-hole edges

(5) Material and surface finishing of fitting groove parts

Cylinder material for dynamic-sealing application should be steel. The most suitable piston rod material is hardened steel.

Soft materials such as aluminum, brass, bronze, Monel metal and soft stainless steel are not suitable as a sliding surface material because of inferior in abrasion resistance.

For static-sealing applications, materials should have sufficient strength to normal operation pressure and should also be resistant to pulsating pressure.

Surface finishing methods to minimize friction are honing, varnishing (roller varnishing), and polishing after hard nickel plating.

Hard-nickel plating is preferable for the application which requires heat resistance, abrasion resistance and low-friction.

Table 2.5.4 shows materials for fitting groove parts and their compatibility

Table 2.5.4 Groove materials and compatibility

2.6 Handling of O-ring

(1) Storage

The following practices are advisable to keep O-ring quality for a long time.

- Do not store where exposed to direct sunlight.
- Store enclosed indoors where temperature is less than 30 ˚C and humidity is less than 65 %.
- Keep O-rings away from heat or ozone sources.
- O-rings should be sealed completely in packages when stored.
- Do not hang or suspend O-rings on hooks, wires, or strings.

(2) Handling

For good performance of O-ring, pay attention to the points shown below.

- Avoid reuse of used O-rings.
- When installing an O-ring, apply sealing medium (lubricant) to the O-ring and contact surface.
- Install an O-ring in the groove without twisting it.
- Do not clean O-ring equipped machine with cleaning oil or gasoline and protect O-ring from cleaning oil. Otherwise, it may be swollen, causing poor sealing performance.
- If an O-ring passes along the threaded surface or sharp edges on it during installation, provide any mechanism to prevent the O-ring from being damaged.
  When fitting an O-ring, insert the cap onto the threaded surface as shown in Fig.2.6.1.

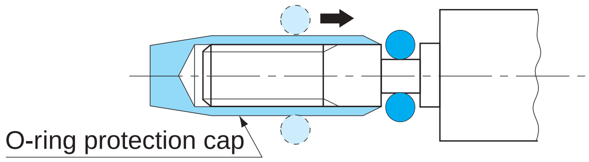

Fig. 2.6.1 O-ring installation jig

2.7 Typical O-ring failures, causes and countermeasures

When leakage is observed, investigate the causes and implement proper countermeasures.

To identify the causes, it is critical to observe the O-ring closely and evaluate the failure in all respects, such as cylinder, piston, and medium to be sealed.

Table 2.7.1 O-ring failures, causes and countermeasures

Ⓓ: Dynamic sealing Ⓢ: Static sealing

Appearance			Major causes	Countermeasures
Phenomenon	Condition			
Ⓓ **Twist**	Twisted and deformed		1) Excessive speed 2) Eccentric movements 3) Poor surface finish on sliding face 4) Twisted installation	• Replace with V-packing • Improve accuracy of equipment • Improve sliding surface finish • Install with care(Coat grease.)
Ⓓ **Chipping**	Partially chipped		• Chipped by the bore edge, threads, or sharp corner at installation	• Round all sharp edges • Use an installation jig
Ⓓ and Ⓢ **Permanent set**	Deformed into the groove's shape		1) Exposure to repeated drastic temperature changes 2) Improper adjustment of temperature, compression, and fluid	• Study alternative rubber materials • Study groove dimensions
Ⓓ **Abrasion around the circumference**	Worn all round the circumference		1) Poor sliding surface finish 2) Poor lubrication 3) Entry of dust or other foreign materials	• Improve sliding surface finish • Supply sufficient lubrication • Clean thoroughly and use filter etc
Ⓓ and Ⓢ **Partial abrasion**	Sliding surface is partially worn		• There are damages on sliding surface	• Remove damages on sliding surface and improve surface finish
Ⓢ **Hardening**	Hardened and cracked when bent		• Operating temperature is higher than the rubber's heat resistance limit	• Study alternative rubber materials
Ⓢ **Swelling**	Softened and swollen		1) Improper rubber material 2) Cleaned with fuel oil or other incompatible cleanser	• Study alternative rubber materials • Clean with kerosene
Ⓢ **Scratch**	Scratch marks are observed		• Scratched by a thread or sharp edge at installation	• Use an installation jig
Ⓢ **Protrusion**	The outside or inside of the ring is cut off partially or around the entire circumference		1) Inappropriate determination of pressure, gap and hardness 2) Due to swelling	• Restudy pressure, gap and hardness • Apply backup rings • Study alternative rubber materials
Ⓢ **Tearing**	The squeezed portion is cut off or chipped		1) Poor chamfer 2) Groove depth is not sufficient	• Improve chamfer • Restudy groove depth
Ⓢ **Crack by ozone**	Cracks are observed on all over the ring		• Left in the air in a stretched condition	• Do not stretch the ring • Coat grease or oil to the O-ring to avoid contact with air • Study alternative rubber materials

Remark) Dotted line shows original O-ring shape or size.

Notes
1) The tolerance of bore diameter d_1 shows the specified values in JIS B 2401 for NBR-70-1, NBR-90, NBR-70-2, EPDM-70, EPDM-90 and SBR-70 (Not standardized in the JIS) products.
For VMQ-70 and ACM-70 products, the tolerance is 1.5 times these values, and for FKM-70, FKM-90, HNBR-70 and HNBR-90 products, 1.2 times.
2) For a static sealing application on a flat surface, design the groove according to dimension d_8 for use under external pressure, or according to dimension d_7 for use under internal pressure. An O-ring for use under external pressure can thus have its bore surface in close contact with the inner wall of the groove during use. Likewise an O-ring for use under internal pressure can thus have its circumferential surface in close contact with the outer wall of the groove.
3) The fitting code is corresponding to the d_4 and d_6 tolerances.
4) Eccentricity E means the difference between the maximum value and minimum value of dimension K.
The eccentricity can also be defined as double the coaxiality measurement.

P 400	400					415							

Notes 1) The tolerance of bore diameter d_1 shows the specified values in JIS B 2401 for NBR-70-1, NBR-90, NBR-70-2, EPDM-70, EPDM-90 and SBR-70 (Not standardized in the JIS) products.
For VMQ-70 and ACM-70 products, the tolerance is 1.5 times these values, and for FKM-70, FKM-90, HNBR-70 and HNBR-90 products, 1.2 times.

2) For a static sealing application on a flat surface, design the groove according to dimension d_8 for use under external pressure, or according to dimension d_7 for use under internal pressure. An O-ring for use under external pressure can thus have its bore surface in close contact with the inner wall of the groove during use. Likewise an O-ring for use under internal pressure can thus have its circumferential surface in close contact with the outer wall of the groove.

3) The fitting code is corresponding to the d_4 and d_6 tolerances.

4) Eccentricity E means the difference between the maximum value and minimum value of dimension K.
The eccentricity can also be defined as double the coaxiality measurement.

Notes
1) The tolerance of bore diameter d_1 shows the specified values in JIS B 2401 for NBR-70-1, NBR-90, NBR-70-2, EPDM-70, EPDM-90 and SBR-70 (Not standardized in the JIS) products.
For VMQ-70 and ACM-70 products, the tolerance is 1.5 times these values, and for FKM-70, FKM-90, HNBR-70 and HNBR-90 products, 1.2 times.
2) For a static sealing application on a flat surface, design the groove according to dimension d_8 for use under external pressure, or according to dimension d_7 for use under internal pressure. An O-ring for use under external pressure can thus have its bore surface in close contact with the inner wall of the groove during use. Likewise an O-ring for use under internal pressure can thus have its circumferential surface in close contact with the outer wall of the groove.
3) The fitting code is corresponding to the d_4 and d_6 tolerances.
4) Eccentricity E means the difference between the maximum value and minimum value of dimension K. The eccentricity can also be defined as double the coaxiality measurement.

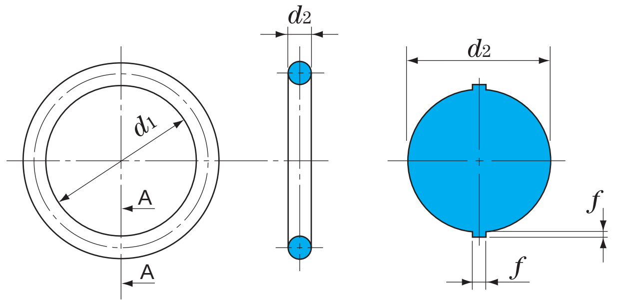
Old ISO A,B,C,D d_1 1.8~75

Old ISO 3601 (for General Industrial Applications)

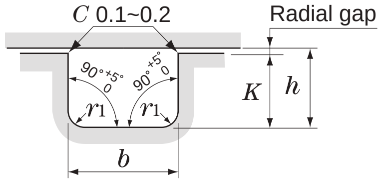
Material : JIS NBR-70-1

■ O-ring shape and dimensions (unit : mm)



Cross section A-A

■ Fitting groove dimensions (unit : mm)



Cross section dia. d_2	Corner radius r_1
1.80 2.65	0.3 ± 0.1
3.55 5.30	0.6 ± 0.2
7.00	1.0 ± 0.2

1) Groove depth K

Determine dimension h to obtain O-ring compression rate between 8 % and 30 %.

Compression rate = $\frac{d_2 - h}{d_2}$ × 100 (%) = 8 % ~ 30 %

Determine the radial gap by the consideration that the double radial gap (gap in diameter) should be less than the value shown in Fig. 2.5.2.

Therefore: $K = h$ – gap in radial

d_2: O-ring cross section diameter

2) Groove width b

Determine groove width by the consideration that O-ring should not occupy more than 90 % of the groove space.

Occupancy percentage = $\frac{\pi \times (d_2/2)^2}{b \times h}$ ×100 (%) < 90 %

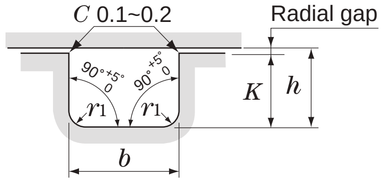
Fitting groove dimensions (unit : mm)



Cross section dia. d_2	**Corner radius** r_1
1.80 2.65	0.3 ± 0.1
3.55 5.30	0.6 ± 0.2
7.00	1.0 ± 0.2

1) Groove depth K

Determine dimension h to obtain O-ring compression rate between 8 % and 30 %.

$$\text{Compression rate} = \frac{d_2 - h}{d_2} \times 100\ (\%) = 8\ \% \sim 30\ \%$$

Determine the radial gap by the consideration that the double radial gap (gap in diameter) should be less than the value shown in Fig. 2.5.2.

Therefore: $K = h -$ gap in radial

d_2: O-ring cross section diameter

2) Groove width b

Determine groove width by the consideration that O-ring should not occupy more than 90 % of the groove space.

$$\text{Occupancy percentage} = \frac{\pi \times (d_2/2)^2}{b \times h} \times 100\ (\%) < 90\ \%$$

Notes 1) For a static sealing application on a flat surface, design the groove according to dimension d_8 for use under external pressure, or according to dimension d_7 for use under internal pressure. An O-ring for use under external pressure can thus have its bore surface in close contact with the inner wall of the groove during use. Likewise an O-ring for use under internal pressure can thus have its circumferential surface in close contact with the outer wall of the groove.

2) Eccentricity E means the difference between the maximum value and minimum value of dimension K. The eccentricity can also be defined as double the coaxiality measurement.

Notes

[1] For a static sealing application on a flat surface, design the groove according to dimension d_8 for use under external pressure, or according to dimension d_7 for use under internal pressure. An O-ring for use under external pressure can thus have its bore surface in close contact with the inner wall of the groove during use. Likewise an O-ring for use under internal pressure can thus have its circumferential surface in close contact with the outer wall of the groove.

[2] Eccentricity E means the difference between the maximum value and minimum value of dimension K. The eccentricity can also be defined as double the coaxiality measurement.

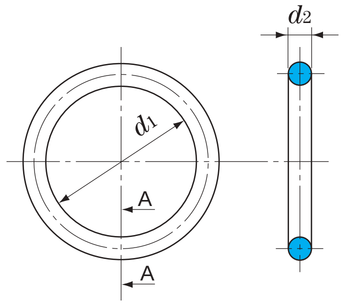
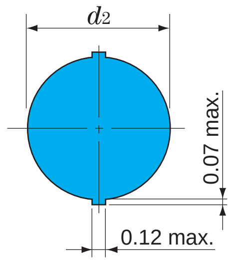
AS 568 for Aircraft Hydraulic Applications (Dynamic Sealing and Static Sealing)

Material : JIS NBR-70-1, NBR-90 and FKM-70

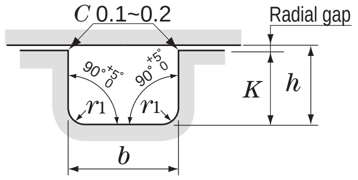
O-ring shape and dimensions (unit : mm)





Cross section A-A

Fitting groove dimensions (unit : mm)



Cross section dia. d_2		Corner radius r_1 max
Over	Up to	
–	3.00	0.4
3.00	6.98	0.8

1) Groove depth K

Determine dimension h to obtain O-ring compression rate between 8 % and 30 %.

$$\text{Compression rate} = \frac{d_2 - h}{d_2} \times 100\ (\%) = 8\ \% \sim 30\ \%$$

Determine the radial gap by the consideration that the double radial gap (gap in diameter) should be less than the value shown in Fig. 2.5.2.

Therefore: $K = h$ – gap in radial

d_2: O-ring cross section diameter

2) Groove width b

Determine groove width by the consideration that O-ring should not occupy more than 90 % of the groove space.

$$\text{Occupancy percentage} = \frac{\pi \times (d_2/2)^2}{b \times h} \times 100\ (\%) < 90\ \%$$

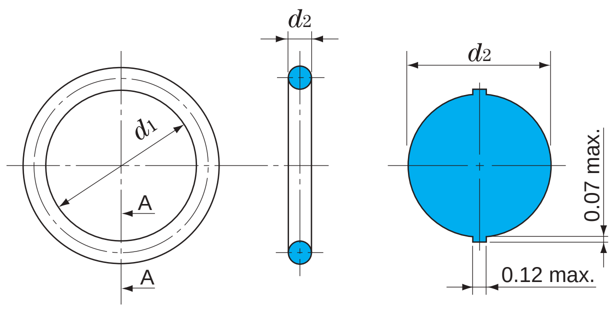
AS 568 for Aircraft Hydraulic Applications (Dynamic Sealing and Static Sealing)

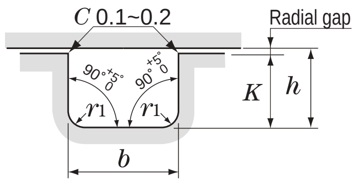
Material : JIS NBR-70-1, NBR-90 and FKM-70

■ O-ring shape and dimensions (unit : mm)



Cross section A-A

■ Fitting groove dimensions (unit : mm)



Cross section dia. d_2		Corner radius r_1 max
Over	Up to	
–	3.00	0.4
3.00	6.98	0.8

1) Groove depth K

Determine dimension h to obtain O-ring compression rate between 8 % and 30 %.

$$\text{Compression rate} = \frac{d_2 - h}{d_2} \times 100\ (\%) = 8\ \% \sim 30\ \%$$

Determine the radial gap by the consideration that the double radial gap (gap in diameter) should be less than the value shown in Fig. 2.5.2.

Therefore: $K = h$ – gap in radial

d_2: O-ring cross section diameter

2) Groove width b

Determine groove width by the consideration that O-ring should not occupy more than 90 % of the groove space.

$$\text{Occupancy percentage} = \frac{\pi \times (d_2/2)^2}{b \times h} \times 100\ (\%) < 90\ \%$$

Notes
1) The cut angle for P3 to P10 is 35°~ 40°.
2) The dimensions shown in the "Bias-cut and Endless ring" column are the dimensions of endless rings. Bias-cut rings are produced by cutting endless rings.
3) In the case of bias-cut and endless ring, the deviation of ring thickness *W* (within one piece) shall be 0.05 mm max.
4) The clearance *Z* is shown when the backup ring is installed on a shaft toleranced to 0 mm / – 0.05 mm.

Notes
1) The cut angle for P3 to P10 is 35°~ 40°.
2) The dimensions shown in the "Bias-cut and Endless ring" column are the dimensions of endless rings.
Bias-cut rings are produced by cutting endless rings.
3) In the case of bias-cut and endless ring, the deviation of ring thickness W (within one piece) shall be 0.05 mm max.
4) The clearance Z is shown when the backup ring is installed on a shaft toleranced to 0 mm / – 0.05 mm.

4.1 Rubber-material varieties and properties

This table compares the properties of all available rubber materials, including those that are not suitable for oil seals and O-rings.

◎ : Resistant to the substance.
○ : Resistant to the substance except under extreme conditions.
△ : Not resistant to the substance except under specific favorable conditions.
× : Not resistant to the substance.

Kind of rubber (ASTM code)		Nitrile rubber (NBR)	Hydrogenated nitrile rubber (HNBR)	Acrylic rubber (ACM and ANM)	Silicone rubber (VMQ)	Fluoro rubber (FKM)	Chloroprene rubber (CR)	Ethylene-propylene rubber (EPM and EPDM)	Styrene-butadiene rubber (SBR)	Urethane rubber (U)	Natural rubber and isoprene rubber (NR and IR)	Butadiene rubber (BR)	Butyl rubber (IIR)	Chlorosulfonated polyethylene rubber (CSM)
Chemical structure		Acrylonitrile-butadiene copolymer	Hydrogenated acrylonitrile-butadiene copolymer	Acrylic-ester copolymer	Organopolysiloxane	Hexafluoropropylene-vinylidene-fluoride copolymer	Polychloroprene	Ethylene-propylene copolymer	Styrene-butadiene copolymer	Polyurethane	Polyisoprene	Polybutadiene	Isobutylene-isoprene copolymer	Chlorosulfonated polyethylene

Typical properties and major applications		The most common oil-resistant rubber material. Good resistance to abrasion. Widely used for oil seals and O-rings.	Excellent heat resistance and mechanical strength, in addition to having properties of nitrile rubber. An optimal material for oil seals for high-temperature or hydraulic applications.	Compared with nitrile rubber, superior in aging resistance. Suitable for sealing hydraulic fluids. Commonly used in automotive applications such as transmission, crankshaft, and valve stem.	Siloxane-based, excellent heat resistance and low-temperature resistance. Suitable for extreme-temperature environments and food processing applications.	Most excellent in resistance against various severe conditions. Optimal for use in proximity to engines.	Well-balanced in resistance to weather, oil and heat. Commonly used to isolate vibration and to coat wires. Some cases used for oil seals and O-rings.	Excellent weatherproof and waterproof. It is used for clad automobiles and wires.	Compared with natural rubber, superior in resistance to abrasion and aging. Used as the material of tires and belts.	Superior mechanical strength and oil resistance, however relatively low heat resistance and waterproofness. Used in applications where heat resistance is not essential.	Excellent resilience and superior abrasion resistance. Oil resistance is relatively low. Used for tires and shoes.	Excellent in resilience and mechanical strength. But inferior in resistance to oil and to pressure. Used for produce tires and sport goods.	Low gas permeability and inferior in resilience. Commonly used for tubes and vibration isolators.	Superior aging resistance and chemical resistance. Used for hoses and cladding.

Note 1) Hardness measured by durometer.

Example

The center columns of numbers is the temperature in either degrees Centigrade (˚C) or Fahrenheit (˚F) whichever is desired to convert into the other.
If degrees Fahrenheit is given, read degrees Centigrade to the left.It degrees Centigrade is given, read degrees Fahrenheit to the right.

$C=\frac{5}{9}(F-32)$

$F=\frac{9}{5}C+32$

INSERT BEARING UNITS

Publication of
New Koyo Insert Bearing Units Catalog

In recent years, needs in industrial world for machineries and equipment highly developed in all aspects have been increased more than ever. Therefore, high technology covering from superior technical advantages including longer service life and maintenance free to higher reliability even under extraordinary conditions such as high and low temperatures and rotation at a high speed is required for insert bearing units.

This catalog completely includes results of technical examinations and abundant research and development.

In the first half of this catalog, technical descriptions referring from the selection to the handling of Koyo Insert Bearing Units are mentioned, while a lot of dimensional tables with types and dimensions are included in the last half. Varied technical information is provided at the last of this catalog. We trust this catalog will help you to select and use Koyo Insert Bearing Units appropriately.

JTEKT keeps trying to get ideas from the market, step up persistent efforts of technical research and development, and provide the best technologies, quality, and services.
JTEKT is grateful for your patronage and look forward to continuing to serve you in the future.

★The contents of this catalog are subject to change without prior notice.
Every possible effort has been made to ensure that the data herein is correct;

1 Structure and features

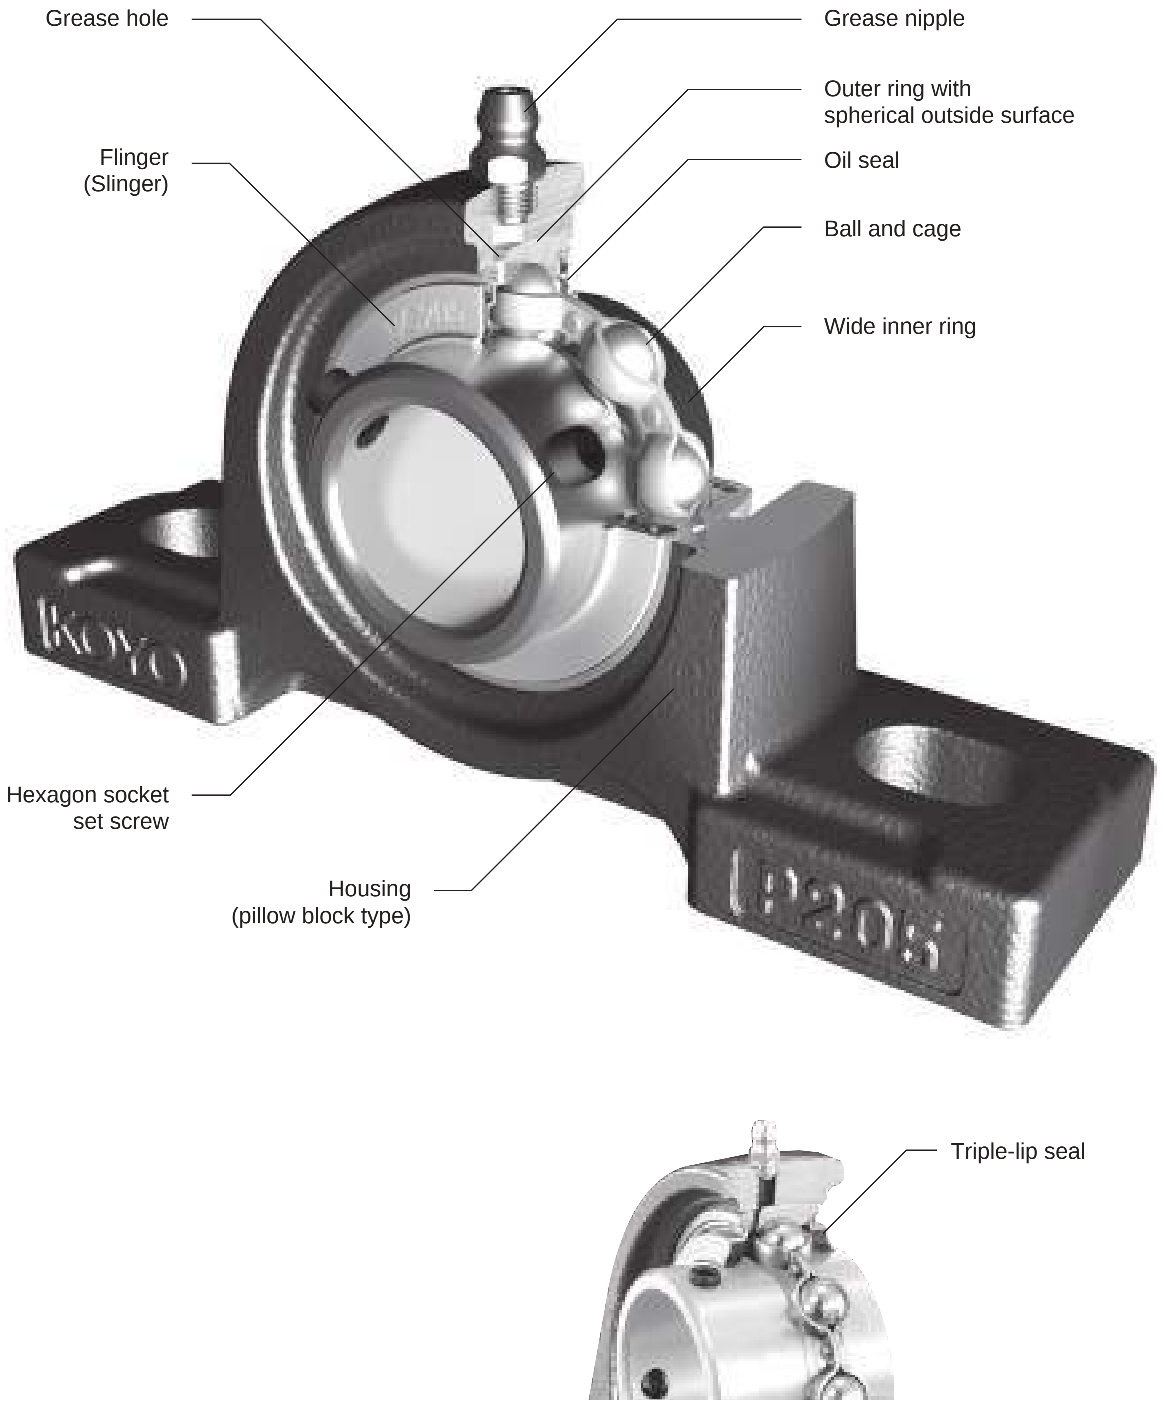
Koyo Insert Bearing Units are highly precise bearing units comprising grease sealed deep groove ball bearings and housings in various forms. The insert bearing units allow easy handling and installation by followings: direct installation to machines and equipment with some bolts, self-aligning, and greasing.

1.1 Structure

Koyo Insert Bearing Unit comprises the insert bearing for unit with spherical outside surface and the housing with spherical bearing seat (**Fig. 1.1**).



Triple-lip seal unit

Fig. 1.1 Structure of insert bearing units (representative example)

1.2 Features

Koyo Insert Bearing Units, having many features, are available in various types. Select the bearing unit optimal for your purpose among the types with unique features.

1 Supreme load capacity and accuracy

Koyo Insert Bearings for unit, featuring the internal structure identical to single row deep groove ball bearings, bear axial load in both directions, as well as great radial load. The tolerance is equal to that of an standard bearing. They feature high rotation accuracy and high speed rotation.

2 Rational self aligning mechanism and optimal fit

Koyo Insert Bearing Units have self aligning mechanism by the spherical outside surface bearing and the housing with and spherical bearing seat. Because of this mechanism, deviation of the shaft center caused by warp of the shaft flexion of axis (shaft) or offset is automatically adjusted to eliminate abnormal load onto the bearing, leading to guarantee of original service life of the bearing.

Since the spherical outside surface of the bearing is ground and the spherical bearing seat of the housing is machined by a boring machine with high accuracy, optimal fitting of the bearing and the housing can be obtained, as well as superior aligning performance.

The allowable aligning angle of standard insert bearing unit is 3º, while that of insert bearing unit with cover is 1º.

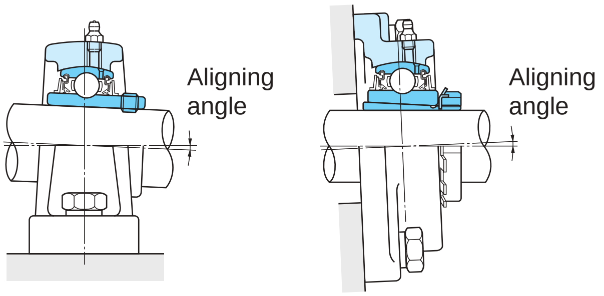


Fig. 1.2 Allowable aligning angle of insert bearing unit

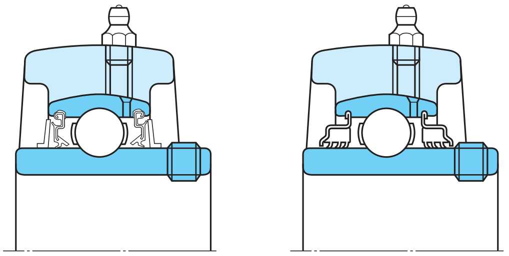
3 Superior sealing performance

Koyo Insert Bearing Units can prevent leak of grease in the bearing to the outside, as well as ingress of dusts and water from the outside into the inside of the bearing by the synergetic effect of the oil seal installed to the outer ring of the bearing and the flinger (slinger) installed to the inner ring of the bearing.

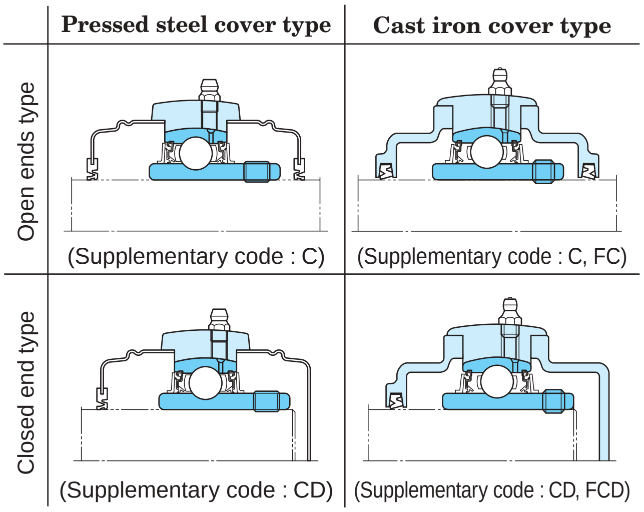
The oil seal is made of synthetic rubber featuring supreme oil proof. Its lip contacts with the inner ring of the bearing with optimal tension (radial load of lip).

When using in environments with many dusts or high humidity, the triple-lip seal unit (supplementary code : L3) or the unit with cover (supplementary code : C, CD, FC, FD) is optimal.

The triple-lip seal unit or unit with cover strongly prevents ingress of water and dusts from the outside, and guarantees a longer service life of the bearing.



Standard type **Triple-lip seal type**
(Supplementary code : L3)



Unit with cover

Fig. 1.3 Sealing mechanism of insert bearing unit

4 Simple greasing

Because of the grease nipple on the housing of Koyo Insert Bearing Unit, fresh grease can be easily supplied to the bearing being operated. If the bearing is used in severe environments that are exposed to many dusts or high humidity or that is high temperture, supply fresh grease at a regular interval. Then, the lubrication status of the bearing is kept to the best, and the service life of the bearing can be extended.

When greasing to the bearing unit with the centralized lubricating system, use the socket for lubricating installed to the grease nipple tapped hole on the housing.

5 Highly rigid and strong housing

Koyo Insert Bearing Unit housing is designed so that it is optimal for reduction of deformation due to centralization of stress and load. After the selection of good material, it is produced by highly advanced casting technique or press working technique.

Since any abnormal load onto the bearing is eliminated by the highly rigid and strong housing, the service life of the bearing can be extended. Baking finish on the surface of the housing keeps good surface status for a long time.

Koyo original solid base pillow block housings seat better and produce a more stable mounting configuration that significantly reduces vibration.

The support ribs have been eliminated to make more room for mounting bolts and washers, yet these housings are more than 30% stronger than before while also reducing housing weight. The new housing downward destruction strength means that the inserts break before the housings.

6 Simple installation and handling

Koyo Insert Bearing Units of many types can be installed to any of machine or equipment with some bolts, and can be used in the status as it is. Clearance fit is used for the inner ring of bearing and the shaft, as a rule.

Therefore, Koyo Insert Bearing Unit does not need any work such as filling of lubricant or installation of sealing unit required for standard bearings. As a result, the total of manpower can be drastically reduced.

As for the fixing method of bearing to shaft, three methods, (1) set screw mounted to the cylindrical bore wide inner ring, (2) adapter installed to the tapered bore inner ring, and (3) eccentric locking collar installed to the cylindrical bore wide inner ring are available.

Fixing of bearing to shaft can be executed easily and securely by adopting any of these method.

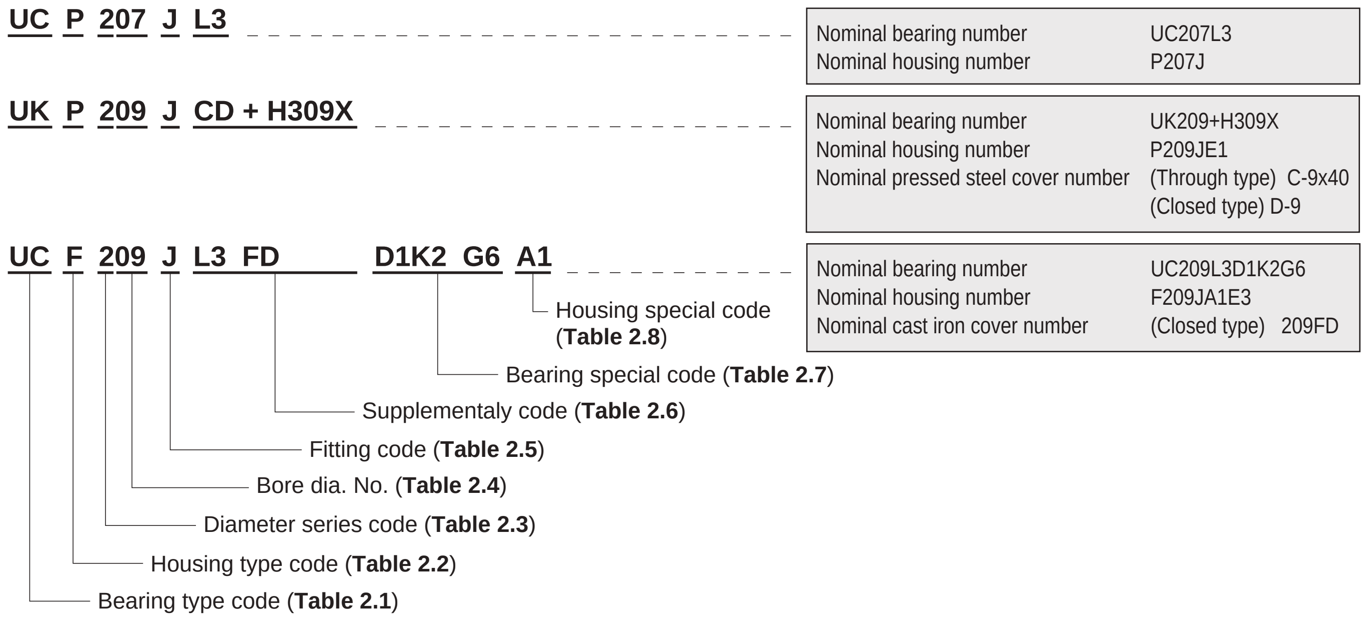
7 Various types

Koyo Insert Bearing Units are available in various types.

Reliability of machine or equipment used together with the units can be improved by selecting and using bearing units optimal for the purpose and operating conditions.

2 Unit number

Nominal number of Koyo Insert Bearing Unit conform to JIS B1557, and comprise the bearing unit type number (comprising bearing type code and housing type code), diameter series code, bore dia. number, supplementary code, and special code.



UC P 207 J L3

Nominal bearing number	UC207L3
Nominal housing number	P207J

UK P 209 J CD + H309X

Nominal bearing number	UK209+H309X
Nominal housing number	P209JE1
Nominal pressed steel cover number	(Through type) C-9x40 (Closed type) D-9

UC F 209 J L3 FD D1K2 G6 A1

Nominal bearing number	UC209L3D1K2G6
Nominal housing number	F209JA1E3
Nominal cast iron cover number	(Closed type) 209FD

[Remark] The above number shows an example of nominal number structure. It may depend on the bearing unit type.

Table 2.1 Bearing type code

Bearing type code	Details
UC	Cylindrical bore, with set screws
UC-S6	Cylindrical bore, with set screws (stainless-series)
UK	Tapered bore (for adapter)
NA	Cylindrical bore, with eccentric locking collar
SB	Cylindrical bore, with set screws (light duty type)
SU	Cylindrical bore, with set screws (“compact” series)
SA	Cylindrical bore, with eccentric locking collar (light duty type)
SU-S6	Cylindrical bore, with set screws (stainless-series)
ER	Cylindrical bore, with set screws, cylindrical outer diameter, Lubricating mechanism
RB	Cylindrical bore, with set screws, cylindrical outer diameter

Table 2.2 Housing type code

Housing type code	Details
P	Pillow block type
IP	Thick section pillow block type
PA	Tapped-base pillow block type
PH	Higher centerheight pillow block type
LP	Light duty pillow block type
P	Pillow block type (“compact” series)
SP	Pillow block type (stainless-series)
SPA	Tapped-base pillow (stainless-series)
SP	Pillow block type (stainless-series)
PP	Cast steel pillow block type
F	Square-flanged type
FL	Rhombic-flanged type
FA	Adjustable rhombic-flanged type
FB	Three-bolt flange type
FC	Round-flanged type with spigot joint
FS	Square-flanged type
FL	Rhombic-flanged type (“compact” series)
SF	Square-flanged type (stainless-series)
SFC	Round-flanged type with spigot joint (stainless-series)
SFL	Rhombic-flanged type (stainless-series)
PF	Pressed steel round-flanged type
PFL	Pressed steel rhombic-flanged type
PFT	Pressed steel triangle-flanged type
T	Take-up type
ST	Take-up type (stainless-series)
TH	Section steel frame take-up type
TL	Light channel steel frame take-up type
TU	Channel steel frame take-up type
PTH	Pressed steel frame take-up type
NPTH	Pressed steel frame take-up type
C	Cartridge type
HA	Hanger type
RU-M	Rubber clamping ring type

Table 2.3 Diameter series code

Diameter series code	Details
0	For light duty
2	For medium duty
X	For medium duty
3	For heavy duty

Table 2.4 Bore dia. number

Bore dia. No.	Details
8	Nominal bearing bore dia. 8 mm
00	Nominal bearing bore dia. 10 mm
01	Nominal bearing bore dia. 12 mm
02	Nominal bearing bore dia. 15 mm
03	Nominal bearing bore dia. 17 mm
04 or more	(Bore dia. No.) × 5 = Nominal bearing bore dia. (mm)
01–8	– (bore dia. No.) /16 = nominal bearing bore dia. (inch) (in this case, 8/16 = 1/2 inch = 12.7 mm)

Table 2.5 Fitting code

Fitting code	Details
J	Tolerance class of spherical bore of the housing is J7 (not shown on the bearing that the spherical bore diameter exceeds 120 mm)
H	Tolerance class of spherical bore of the housing is H7 With integrated lock pin
K	Tolerance class of spherical bore of the housing is K7

Table 2.6 Supplementary code

Supplementary code	Details
C	Cover, open type
D	Cover, closed type
FC	Cast iron cover, open type
FD	Cast iron cover, closed type
L2[1)]	Double-lip seal type
L3[1)]	Triple-lip seal type

Note 1) Standard specifications of codes L2 and L3 are as shown below.

Bearing No.	Applicable seal type
UC201 to UC205, UK205 NA201 to NA205	L2 (Double-lip seal)
UC206 to UC218, UK206 to UK218 NA206 to NA215	L3 (Triple-lip seal)
UCX05 to UCX17, UKX05 to UKX17	
UC307 to UC328, UK307 to UK328	

However, UC 206 - 18 to UC 206 - 20 are L2 [double-lip seal type]

[Remark] Please refer to **“16 Parts and accessories”** for cover details.

Table 2.7 Bearing special code

Item	Bearing special code	Details
Grease	**None**	Alvania No.2 or equivalents
	D1	SH44M
	D2	SH33M
	D9	Demnum L-200
Set Screw	**None**	Bullet Point
	G4	Pointed tip
	G6	With full dog point
Oil seal	**None**	Nitrile rubber
	K2	Silicone rubber
	K3	Non-contact type
Sealing Device	**None**	With oil seal and flinger (slinger) (UC, UK, NA, ER and RB types) With oil seal (SB, SA and SU types)
	P3	Without oil seal, flinger (slinger)
	P4	Without oil seal
Others	**P11**[1)]	With integrated lock pin
	S3	Air handling fit,100% noise check, the anti-rotation pin
	S5	For blower (oil seal : K3, inner clearance and bearing accuracy are specially controlled)
	S6	Stainless steel bearing
	S7	Plated bearing (for corrosion-resistance)

Note 1) Code P11 is unnecessary in the following cases.

Bearing Type	Bearing No.	Fitting code	Code
UC	313 or more	**J**	Not indication
UC200S6, SU000S6	All		
All	All	**H**	

Table 2.8 Housing special code

Item	Housing special code	Details
Grease Nipple Thread Bore dia.	**None**	As shown in dimensional table
	A1	PT1/8 tube thread
	A2	PF1/8 tube thread
	A3	PT1/4 tube thread
	A4	PF1/4 tube thread
Grease Nipple Thread Bore Position	**None**	As shown in dimensional table
	B1	Right
	B2	Left
	B3	45º
	B5	30º
	B7	Both right and left
Machining	**None**	Standard type
	E1	Pressed steel cover mounting groove
	E3	Cast iron cover mounting groove (diameter series 2, X, 3)
	E4	Non-lubricating type
Material	**None**	Gray iron casting (FC200) or cold-reduced carbon steel sheets and strips (SPCC) Compact type is made of zinc alloy die-cast (ZDC2) Small stainless series is made of stainless cast steel type (SCS13)
	H4	Ductile iron (FCD450-10)
	H5	Rolled steel for general purpose (SS400)
Grease Nipple	**None**	A type
	N1	B type (67.5º)
	N2	C type (90º)

3 Types

3.1 Type list

Koyo Insert Bearing Units are available in various types.

Table 3.1 and **Table 3.2** show the types of Koyo Insert Bearing Units and insert bearing for unit.

Table 3.1 Koyo Insert Bearing Units types

Type		Bearing bore dia. Surface (fixing to shaft)	Type code	Shaft dia.		Dimension table
				(inch)	(mm)	
1 Pillow block type	(1) Standard	Cylindrical bore (with set screws)	**UCP**	$^{1}/_{2}$ – 4	12 – 140	P.78
		Cylindrical bore (with eccentric locking collar)	**NAP**	$^{1}/_{2}$ – 2 $^{15}/_{16}$	12 – 75	P.84
			NAPK	$^{1}/_{2}$ – 2 $^{15}/_{16}$	12 – 75	P.86

	(4) Triangle-flanged type	Cylindrical bore (with set screws)	**SBPFT**	N/A	12 – 35	P.182

Table 3.1 Koyo Insert Bearing Units types (continued)

Type		Bearing bore dia. Surface (fixing to shaft)	Type code	Shaft dia.		Dimension table
				(inch)	(mm)	
6 Take-up type	(1) Standard	Cylindrical bore (with set screws)	**UCT**	$^{1}/_{2}$ – 4	12 – 140	P.184
			UCT-E	$^{1}/_{2}$ – 3 $^{7}/_{16}$	12 – 85	P.190
		Tapered bore (with adapter)	**UKT**	$^{3}/_{4}$ – 4 $^{1}/_{2}$	20 – 125	P.194
	(2) Stainless-series	Cylindrical bore (with set screws)	**UCST-S6**	N/A	20 – 50	P.198
	(3) Section steel frame type	Cylindrical bore (with set screws)	**UCTH**	$^{1}/_{2}$ – 2 $^{1}/_{2}$	12 – 65	P.200
	(4) Channel steel frame type	Cylindrical bore (with set screws)	**UCTL**	N/A	20 – 45	P.202
			UCTU	N/A	40 – 90	P.204
	(5) Pressed steel frame type	Cylindrical bore (with set screws)	**SBPTH**	N/A	12 – 25	P.208
			SBNPTH	N/A	12 – 25	P.210
7 Cartridge type		Cylindrical bore (with set screws)	**UCC**	$^{1}/_{2}$ – 4	12 – 140	P.212
		Tapered bore (with adapter)	**UKC**	$^{3}/_{4}$ – 4 $^{1}/_{2}$	20 – 125	P.216
8 Hanger type		Cylindrical bore (with set screws)	**UCHA**	$^{1}/_{2}$ – 3	12 – 75	P.218
9 Rubber clamping ring type		Cylindrical bore (with set screws)	**RU-M**	N/A	20 – 30	P.220

Table 3.2 Types of insert bearing for Koyo Insert Bearing Unit

Type		Bearing bore dia. Surface (fixing to shaft)	Type code	Shaft dia.		Dimension table
				(inch)	(mm)	
Insert bearing for units	(1) Standard	Cylindrical bore (with set screws)	**UC**	$^{1}/_{2}$ – 4	12 – 140	P.222
	(2) Standard	Tapered bore (with adapter)	**UK**	$^{3}/_{4}$ – 4 $^{1}/_{2}$	20 – 125	P.234
	(3) Standard	Cylindrical bore (with eccentric locking collar)	**NA**	$^{1}/_{2}$ – 3	12 – 75	P.230
	(4) Light duty	Cylindrical bore (with set screws)	**SB**	$^{1}/_{2}$ – 1 $^{1}/_{2}$	12 – 40	P.222
	(5) Light duty	Cylindrical bore (with eccentric locking collar)	**SA**	$^{1}/_{2}$ – 1 $^{9}/_{16}$	12 – 40	P.230
			SA-F	$^{1}/_{2}$ – 2 $^{3}/_{16}$	12 – 55	
	(6) “Compact”	Cylindrical bore (with set screws)	**SU**	N/A	8 – 30	P.222
	(7) Stainless steel	Cylindrical bore (with set screws)	**UC-S6**	N/A	12 – 65	P.228
			SU-S6	N/A	10 – 30	
	(8) Cylindrical outside surface (with lubricating mechanism and snap ring)	Cylindrical bore (with set screws)	**ER**	$^{1}/_{2}$ – 2 $^{7}/_{16}$	12 – 60	P.240
	(9) Cylindrical outside surface	Cylindrical bore (with set screws)	**RB**	$^{1}/_{2}$ – 1 $^{9}/_{16}$	12 – 40	P.240
	(10) Adapter assembly		**H2300X**	$^{3}/_{4}$ – 5	20 – 125	P.242

3.2 Types and features

Koyo Insert Bearing Units are available in various types by combinations of bearings and housings.

Types and features of the Insert Bearing Units are shown below.

Remark) Descriptions of codes for unit with cover are shown in the table below. (common to all the types)

Diameter series	Code	Descriptions
2	C, CD	Pressed steel cover type
	FC, FCD	Cast iron cover type
X	C, CD	From **X05** to **X17** : pressed steel cover type **X18** and **X20** : cast iron cover type
3	C, CD	Cast iron cover type

1 Pillow block type units

1 Pillow block type units

UCP

UKP

NAP

NAPK

Cylindrical bore (with set screws)…Bearing **UC2 (X, 3)** series are used.

UCP2 (X, 3) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

C, CD (FC, FCD) : Pressed steel cover type or cast iron cover type

Cylindrical bore (with eccentric locking collar) …Bearing **NA2** series are used.

NAP2, NAPK2 : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

Tapered bore (with adapter)…Bearing **UK2 (X, 3)** series are used.

UKP2 (X, 3) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

C, CD (FC, FCD) : Pressed steel cover type or cast iron cover type

This is the most typical type insert bearing unit. The rib at the bottom of the housing mounting section allows the highly strong structure which withstands against loads applied from all the directions.

The housing can be installed to a machine with two bolts. As for the tapered bore (UKP) type, nominal number of adapter assembly which follows the nominal number of unit should be added.

Applications : Transmission devices, general industrial equipment

2 Thick section pillow block type units

UCIP

UKIP

Cylindrical bore (with set screws)…Bearing **UC2 (3)** series are used.

UCIP2 (3) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

C, CD (FC, FCD) : Pressed steel cover type or cast iron cover type

Tapered bore (with adapter)…Bearing **UK2 (3)** series are used.

UKIP2 (3) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

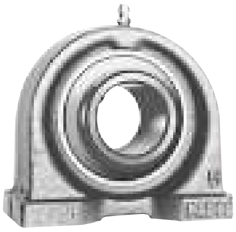
C, CD (FC, FCD) : Pressed steel cover type or cast iron cover type

This pillow block type unit is applicable for use with a great load. The thick and highly rigid housing is suitable to environment exposed to a great load, vibration, and impact. The mounting bolt holes are drilled, and the housing can be installed to the exact location with two bolts.

Applications : Crane, heavy object conveyor, quarrying plant, ships

(1 Pillow block type units)

3 Tapped-base pillow block type unit



UCPA

Cylindrical bore (with set screws)…Bearing **UC2** series are used.

UCPA2 : Standard type, **L3 (L2)** : Triple-lip seal type or
Double-lip seal type

This pillow block type unit is designed so that the mounting space is reduced. It is installed to machines with the two tapped holes on the housing mounting bottom.

Applications : Roller conveyor, purpose with small mounting space

4 Higher centerheight pillow block type unit

UCPH

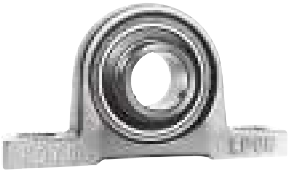
Cylindrical bore (with set screws)…Bearing **UC2** series are used.

UCPH2 : Standard type, **L3 (L2)** : Triple-lip seal type or
Double-lip seal type

This unit, designed as the higher centerheight pillow block type unit, has high strength against impact load. It is suitable for the machine that the distance from the mounting bottom to the shaft center is long. The housing can be installed to machines with two bolts.

Applications : Printing machine, spinneret

5 Light duty pillow block type unit



BLP

ALP

Cylindrical bore (with set screws)…Bearing **SB2** series are used.

BLP2

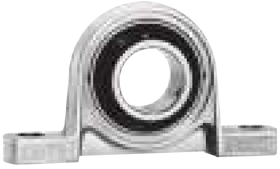
Cylindrical bore (with eccentric locking collar)
…Bearing **SA2** series are used.

ALP2

This pillow block type unit is designed for the aim of lightweight. The housing can be installed to machines with two bolts.

Applications : Machinery for general purposes aiming at lightweight

6 "Compact" series pillow block type unit



UP

Cylindrical bore (with set screws)…Bearing **SU0** series are used.

UP0

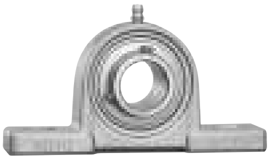
C, CD : Rubber coating cover type

The small and lightweight pillow block type unit, comprising the insert bearing for unit for light load and the special lightweight alloy housing, needs not to be lubricated additionally.

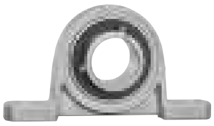
The housing can be installed to machines with two bolts.

Applications : Machineries for light load

7 Stainless-series pillow block type units



UCSP-S6



USP-S6

UCSPA-S6

Cylindrical bore (with set screws)

Standard…Bearing **UC2-S6** series are used.

UCSP2-S6

C, CD : Pressed stainless steel cover type

Tapped base…Bearing **UC2-S6** series are used.

UCSPA-S6

C, CD : Pressed stainless steel cover type

Compact…Bearing **SU0-S6** series are used.

USP0-S6

C, CD : Pressed stainless steel cover type

This superior anticorrosion pillow block type unit comprises the bearing and housing made of stainless steel. The unit is thinner than standard UCP series units, leading to downsizing of machinery. The housing can be installed to machines with two bolts.

Applications : Food machinery, agricultural machinery

2 Square-flanged type units

1 Square-flanged type units

UCF, UCF-E

UKF

NANF

Cylindrical bore (with set screws)…Bearing **UC2 (X, 3)** series are used.

UCF2 (X, 3) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

C, D (FC, FD) : Pressed steel cover type or cast iron cover type

UCF2 (X) -E : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

Cylindrical bore (with eccentric locking collar)

…Bearing **NA2** series are used.

NANF2 : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

Tapered bore (with adapter)…Bearing **UK2 (X, 3)** series are used.

UKF2 (X, 3) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

C, D (FC, FD) : Pressed steel cover type or cast iron cover type

This bearing unit comprises the insert bearing for unit and the housing with square flange. It is suitable to use on a vertical surface, such as the side of machinery.

The housing can be installed to machines with four bolts.

(2 Square-flanged type units)

2 Square-flanged types with spigot joint

UCFS

UKFS

Cylindrical bore (with set screws)…Bearing **UC3** series are used.

UCFS3 : Standard type, **L3 (L2)** : Triple-lip seal type or
Double-lip seal type

C, D : Cast iron cover type

Tapered bore (with adapter)…Bearing **UK3** series are used.

UKFS3 : Standard type, **L3 (L2)** : Triple-lip seal type or
Double-lip seal type

C, D : Cast iron cover type

This bearing unit comprises the insert bearing for unit, square flange, and the housing with spigot joint on the mounting surface. The housing can be installed to a machine by fitting the spigot joint into the mounting hole of it, and using four bolts.

The housing can be installed to the exact location by fitting the spigot joint into the mounting hole.

Applications : Rotating drum, rotating roller, purposes excellent mounting accuracy is required

3 Stainless-series square-flanged type unit

UCSF-S6

Cylindrical bore (with set screws)…Bearing **UC2-S6** series are used.

UCSF2-S6

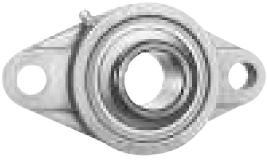
C, D : Pressed stainless steel cover type

In this superior waterproof and anticorrosion square-flanged type unit, bearing and housing are made of stainless steel. The unit is thinner than standard UCF series units, leading to downsizing of machinery. The housing can be installed to machines with four bolts.

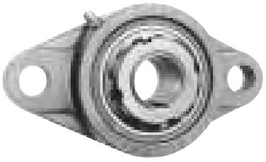
Applications : Food machinery, agricultural machinery

3 Rhombic-flanged type units

1 Rhombic-flanged type units



UCFL, UCFL-E



UKFL

NANFL

Cylindrical bore (with set screws)…Bearing **UC2 (X, 3)** series are used.

UCFL2 (X, 3) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

C, D (FC, FD) : Pressed steel cover type or cast iron cover type

UCFL2 (X) -E : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

Cylindrical bore (with eccentric locking collar)

…Bearing **NA2** series are used.

NANFL2 : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

Tapered bore (with adapter)…Bearing **UK2 (X, 3)** series are used.

UKFL2 (X, 3) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

C, D (FC, FD) : Pressed steel cover type or cast iron cover type

This bearing unit comprises the insert bearing for unit and the housing with rhombic flange. It is suitable to use on a vertical surface, such as the side of machinery. Compared to the square-flanged type unit, it requires less mounting space, and the unit weight is also reduced.

Since the pitches of the center of two mounting bolt holes on the rhombic-flanged type housing are the same as those of the center of bolt holes located opposite each other on the square-flanged housing, they are compatible.

The housing can be installed to machines with two bolts.

Applications : Roller conveyor, environment the mounting dimensions are small

2 Adjustable rhombic-flanged type unit

UCFA

Cylindrical bore (with set screws)…Bearing **UC2** series are used.

UCFA2 : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

This rhombic-flanged type unit allows angle adjustment with a supporting point as the shaft center. Therefore, when the bearing unit is installed, fine adjustment of supporting location for the shaft center is enabled.

Since the pitches of the center of mounting bolt holes on the housing are the same as those of the square-flanged type unit and rhombic-flanged type unit, they are compatible.

The housing can be installed to machines with two bolts.

(3 Rhombic-flanged type units)

3 Three-bolt flange type unit

UCFB

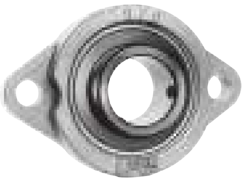
Cylindrical bore (with set screws)…Bearing **UC2** series are used.

UCFB2 : Standard type, **L3 (L2)** : Triple-lip seal type or
Double-lip seal type

The housing of this unit has the one-side rhombic flange, and the unit is suitable to use on a vertical surface and in a limited space, such as the side of machinery.

The housing can be installed to machines with three bolts.

4 Light duty rhombic-flanged type units



BLF

ALF

Cylindrical bore (with set screws)…Bearing **SB2** series are used.

BLF2

Cylindrical bore (with eccentric locking collar)
…Bearing **SA2** series are used.

ALF2

This rhombic-flanged type unit is designed for the aim of lightweight. The housing can be installed to machines with two bolts.

5 "Compact" series rhombic-flanged type unit

UFL

Cylindrical bore (with set screws)…Bearing **SU0** series are used.

UFL0

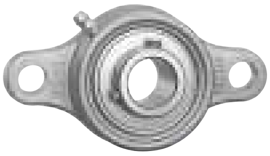
C, D : Rubber coating cover type

The small and lightweight rhombic-flanged type unit, comprising the insert bearing for unit for light load and the special lightweight alloy housing, needs not to be lubricated additionally.

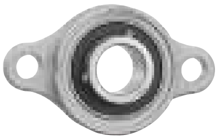
The housing can be installed to machines with two bolts.

Applications : Machineries for light load

6 Stainless-series rhombic-flanged type units



UCSFL-S6



USFL-S6

Cylindrical bore (with set screws)

Standard…Bearing **UC2X (2) -S6** series are used.

UCSFL2X (2) -S6

C, D : Pressed stainless steel cover type

Compact…Bearing **SU0-S6** series are used.

USFL0-S6

C, D : Rubber coating cover type

This superior anticorrosion rhombic-flanged type unit comprises the bearing and housing made of stainless steel. The unit is thinner than standard UCFL series units, leading to downsizing of machinery.

The housing can be installed to machines with two bolts.

Applications : Food machinery, agricultural machinery

4 Round-flanged types with spigot joint

1 Round-flanged types with spigot joint

UCFC, UCFC-E

UKFC

Cylindrical bore (with set screws)…Bearing **UC2 (X)** series are used.

UCFC2 (X) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

C, D (FC, FD) : Pressed steel cover or cast iron cover type

UCFCX-E : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

Tapered bore (with adapter)…Bearing **UK2 (X)** series are used.

UKFC2(X) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

C, D (FC, FD) : Pressed steel cover or cast iron cover type

This bearing unit comprises the insert bearing for unit, round flange, and the housing with spigot joint on the mounting surface. The housing can be installed to machines by fitting the spigot joint into the mounting hole of machinery, and using four bolts.

The housing can be installed to the exact location by fitting the spigot joint into the mounting hole.

Applications : Rotating drum, rotating roller, purposes excellent mounting accuracy is required.

2 Stainless-series round-flanged types with spigot joint

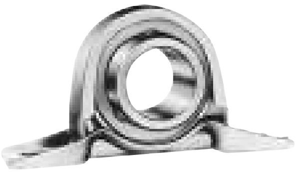
UCSFC is a four-Bolt Flange Cartridge Units that is made entirely out of stainless steel components for the highest level of corrosion resistance for a mounted bearing unit. It is also prefilled with food grade grease for food processing applications.

Duty: Standard

UCSFC-S6

5 Pressed steel housing type units

1 Pressed steel pillow block type unit



SBPP

SAPP

Cylindrical bore (with set screws)…Bearing **SB2** series are used.

SBPP2

Cylindrical bore (with eccentric locking collar)

…Bearing **SA2** series are used.

SAPP2

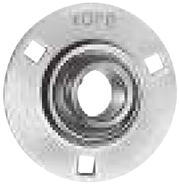
This lightweight pillow block type unit for light load comprises the insert bearing for lightweight unit and the pressed steel plate housing.

The housing can be installed to machines with two bolts.

Applications : Light duty conveyor, environment exposed to light load and low speed rotation

(5 Pressed steel housing type units)

2 Pressed steel round-flanged type units



SBPF

SAPF

Cylindrical bore (with set screws)…Bearing **SB2** series are used.

SBPF2

Cylindrical bore (with eccentric locking collar)
…Bearing **SA2** series are used.

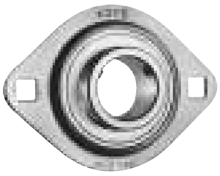
SAPF2

This lightweight round-flanged type unit for light load comprises the insert bearing for lightweight unit and the pressed steel plate housing.

The housing can be installed to machines with three bolts.

Applications : Light duty conveyor, environment exposed to light load and low speed rotation

3 Pressed steel rhombic-flanged type units



SBPFL

SAPFL

Cylindrical bore (with set screws)…Bearing **SB2** series are used.

SBPFL2

Cylindrical bore (with eccentric locking collar)
…Bearing **SA2** series are used.

SAPFL2

This lightweight rhombic-flanged type unit for light load comprises the insert bearing for lightweight unit and the pressed steel plate housing. Compared to the pressed steel round-flanged type unit, less mounting space is required.

The housing can be installed to machines with two bolts.

Applications : Light duty conveyor, environment exposed to light load and low speed rotation

4 Pressed steel triangle-flanged type units

SBPFT

Cylindrical bore (with set screws)…Bearing **SB2** series are used.

SBPFT2

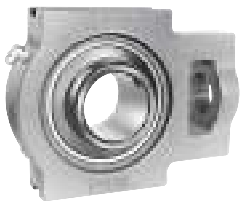
This lightweight triangle-flanged type unit for light load comprises the insert bearing for lightweight unit and the pressed steel plate housing.

The housing can be installed to machines with three bolts.

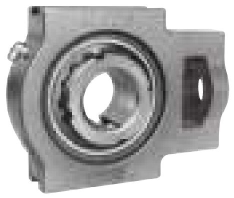
Applications : Light duty conveyor, environment exposed to light load and low speed rotation

6 Take-up type units

1 Take-up type units



UCT, UCT-E



UKT

Cylindrical bore (with set screws)…Bearing **UC2 (X, 3)** series are used.

UCT2 (X, 3) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type
C, CD (FC, FCD) : Pressed steel cover or cast iron cover type
UCT2 (X) -E : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

Tapered bore (with adapter)…Bearing **UK2 (X, 3)** series are used.

UKT2(X, 3) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type
C, CD (FC, FCD) : Pressed steel cover or cast iron cover type

The bearing unit comprises the insert bearing for unit and the housing with slide groove. This unit allows angle adjustment with a supporting point of the shaft center by moving the housing in radial direction along the slide groove.

Applications : Belt conveyor, use the supporting point of the shaft center must be adjusted

2 Stainless-series take-up type unit

UCST-S6

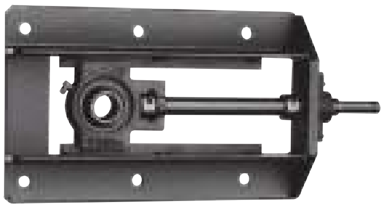
Cylindrical bore (with set screws)…bearing **UC2-S6** series are used.

UCT2-S6
C, CD : Pressed stainless steel cover type

This superior anticorrosion take-up type unit comprises the bearing and the housing made of stainless steel. The unit is thinner than standard UCT series units, leading to downsizing of machinery.

Applications : Conveyor of food machinery, agricultural machinery

3 Section steel frame take-up type unit



UCTH

Cylindrical bore (with set screws)…Bearing **UC2** series are used.

UCTH2 : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type
C, CD (FC, FCD) : Pressed steel or cast iron cover type

This unit comprises the take-up type unit, the section steel frame, adjuster bolt, and so on.

This unit allows adjustment of the supporting point of the shaft center by moving the housing in radial direction with the adjuster bolt on the unit.

The housing can be installed to machines with six bolts.

Applications : Belt conveyor, use the supporting point of the shaft center must be adjusted

(6 Take-up type units)

4 Channel steel frame take-up type unit

UCTL

Cylindrical bore (with set screws)…Bearing **UC2 (3)** series are used.

UCTL2 : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

C, CD (FC, FCD) : Pressed steel cover or cast iron cover type

UCTU2 (3) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

C, CD (FC, FCD) : Pressed steel cover or cast iron cover type

This unit comprises the take-up type unit, the channel steel frame, adjuster bolt, and so on. This unit allows adjustment of the supporting point of the shaft center by moving the housing in radial direction with the adjuster bolt in the frame.

Since this unit is installed with the frame stood, the mounting space is reduced.

The TL lightweight type unit is made of light channel steel, and the TU highly rigid type unit is made of channel steel. The housing can be installed to machines with two or four bolts.

Tapered bore (with adapter) unit is also available (examples of nominal number : UKTL 207J-100, UKTU208J-500).

Applications : Belt conveyor, use the supporting point of the shaft center must be adjusted

5 Pressed steel frame take-up type unit

SBPTH

Cylindrical bore (with set screws)…Bearing **SB2** series are used.

SBPTH2

SBNPTH2

This unit comprises the pressed steel take-up type unit, the pressed steel frame, adjuster bolt, and so on. This unit allows adjustment of the supporting point of the shaft center by moving the housing in radial direction with the adjuster bolt in the frame.

Since the housing and the frame are made of pressed steel, the unit is compact and lightweight. The housing can be installed to machines with four or six bolts.

Applications : Small belt conveyor for lightload, use the supporting point of the shaft center must be adjusted

7 Other units

1 Cartridge type units

UCC

UKC

Cylindrical bore (with set screws)…Bearing **UC2 (X, 3)** series are used.

UCC2 (X, 3) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

Tapered bore (with adapter)…Bearing **UK2 (X, 3)** series are used.

UKC2 (X, 3) : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

This unit comprises the insert bearing for unit and the housing with the cylindrical outside surface. The housing, having the grounded cylindrical outer surface, can be fit to the cylindrical bore of a machine.

The cartridge type unit, moving in axial direction, is used as the bearing for free side when a shaft is expanded or contracted.

The cylindrical outside surface and the automatic aligning mechanism allow handling similar to standard automatic aligning type bearing.

2 Hanger type unit

UCHA

Cylindrical bore (with set screws)…Bearing **UC2** series are used.

UCHA2 : Standard type, **L3 (L2)** : Triple-lip seal type or Double-lip seal type

The bearing unit comprises the insert bearing for unit and the housing with parallel thread for pipe on one side. The compact housing is installed to machinery with suspended with steel pipe.

Applications : Intermediate bearing of screw conveyor

8 Insert bearings for units

1 UC type bearing

UC

Cylindrical bore (with set screws)

UC2 (X, 3)…Standard type

UC2 (X, 3) L3 (L2)…Triple-lip seal type or Double-lip seal type

UC2-S6…Stainless steel series

This grease sealed type deep groove insert bearing incorporates the outer ring with the spherical outside surface and lubricating mechanism and wide inner ring with cylindrical bore set screw. Two types, standard type (oil seal and flinger are included) and triple-lip seal type (supplementary code : L3), are available, depending on the type of sealing device.

It can be fixed to shaft with two set screws on the inner ring. It is the most typical type in insert bearings for unit.

The UC2-S6 series are superior waterproof and anticorrosive insert bearings for unit. The bearing is made of stainless steel, and the series are used for stainless-series units.

As for the types and features of set screw for UC type bearing, see **"14 Handling"**.

(8 Insert bearings for units)

2 UK type bearing

UK

Tapered bore (with adapter)

UK2 (X, 3)…Standard type

UK2 (3) L3 (L2)…Triple-lip seal type or Double-lip seal type

This grease sealed type deep groove ball bearing incorporates the outer ring with the spherical outside surface and lubricating mechanism and wide inner ring with tapered bore. Two types, standard type (oil seal and flinger are included) and triple-lip seal type (supplementary code : L3), are available, depending on the type of sealing device.

It can be fixed to shaft with the adapter. The UK type bearing (with adapter) is optimal for use of long shaft.

As for the UK type bearing, applicable adapter assembly number should be added to the bearing number.

3 NA type insert bearing

NA

Cylindrical bore (with eccentric locking collar)

NA2

This type is based on the UC type bearing having set screw, but equipped with the eccentric locking collar. The grease sealed type deep groove ball bearing incorporates the spherical outside surface outer ring with lubricating mechanism and the cylindrical bore, wide inner ring, and eccentric locking collar with eccentric section on one side. The sealing device is equipped with the oil seal and flinger.

When fixing the bearing to shaft, fit the eccentric recessed section of the eccentric locking collar to the eccentric section of the inner ring, turn the eccentric locking collar to fix it to shaft, and tighten the set screw of the eccentric locking collar to shaft.

4 SB type bearing

SB

Cylindrical bore (with set screws)

SB2

This is the lightweight UC type bearing. The non-lubricating type grease sealed deep groove ball bearing incorporates the spherical outside surface outer ring and the wide inner ring with cylindrical bore set screw. When fixing it to shaft, use the two set screws on the inner ring.

It is used for lightweight unit or pressed steel unit.

5 SA type bearing

SA

SA-F

Cylindrical bore (with eccentric locking collar)

SA2, SA2-F

This type is based on the SB type bearing having set screw, but equipped with the eccentric locking collar. The non-lubricating type grease sealed type deep groove ball bearing incorporates the spherical outside surface outer ring and the cylindrical bore, wide inner ring, and eccentric locking collar with eccentric section on one side.

When fixing the bearing to shaft, fit the eccentric recessed section of the eccentric locking collar to the eccentric section of the inner ring, turn the eccentric locking collar to fix it to shaft, and tighten the set screw of the eccentric locking collar to shaft.

(SA-F type bearing has lubricating mechanism on outer ring.)

It is used for lightweight unit or pressed steel unit.

6 SU type bearing (“compact” series)

SU

Cylindrical bore (with set screws)

SU0…Standard type

SU0-S6…Stainless steel

The bearing series intended for light load is suitable for downsizing and weight saving.

The non-lubricating type grease sealed deep groove ball bearing incorporates the spherical outside surface outer ring and the wide inner ring with cylindrical bore set screw. When fixing it to shaft, use the two set screws on the inner ring.

The SU0-S6 type bearing for unit, made of stainless steel, is superior in corrosion resistance, and used for stainless-series units.

7 ER type bearing

ER

Cylindrical bore (with set screws), cylindrical outside surface, lubricating mechanism, locating snap ring and snap ring groove

ER2

The grease sealed type deep groove ball bearing incorporates the spherical outside surface with lubricating mechanism and set screw, the wide inner ring with cylindrical bore set screw. When fixing it to shaft, use the two set screws on the inner ring.

It features lubricating mechanism, set screw (easy to locate bearing), clearance fit of inner ring and shaft (easy to install). Therefore, it can be used for various purposes in a similar way to standard bearings.

8 RB type bearing

RB

Cylindrical bore (with set screws), cylindrical outside surface

RB2

This bearing is based on the ER type bearing, but without the lubricating mechanism and locating snap ring and snap ring groove. The grease sealed deep groove ball bearing incorporates the spherical outside surface outer ring and the wide inner ring with cylindrical bore set screw. When fixing it to shaft, use the two set screws on the inner ring.

Since clearance fit may be used for installation of the inner ring to shaft (easy to install), it can be used for various purposes in a similar way to standard bearings.

3.3 Unit for special use

To meet with requests for varied and special purposes, JTEKT supplies insert bearing series for special use with various features, as well as standard types. If you use insert bearing units under special environment or conditions, select optimal type among insert bearing units for special use.

JTEKT produces bearing units in various forms and specifications, other than units for special use. Contact JTEKT, if you need them.

1 Triple-lip seal unit (Double-lip seal unit) (supplementary code : L3 (L2))

Triple-lip seal has the structure in which the triple-lip oil seal is glued to the pressed steel shield plate with vulcanized adhesive. The triple-lip eliminates ingress of dusts and mud water into bearing to ensure long service life of the bearing even under severe environmental conditions.

Since the triple-lip seal is fit to the outer ring of the bearing, the triple-lip seal bearing unit can be handled in the same manner as the standard types. The triple-lip seal unit does not lead to uneven contact of the shaft with seal while the bearing is aligned unlike the unit with cover, and maintains stable sealing performance for a long time.

The triple-lip seal unit is the outstanding product that defects of conventional dust and water preventive unit are improved to realize energy-saving and low cost. The triple-lip seal is applicable to the UC type bearing and the UK type bearing.

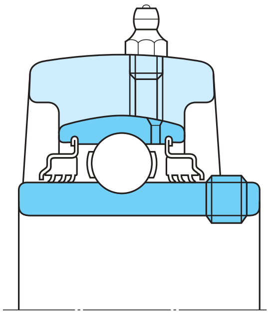


Fig. 3.1 Structure of triple-lip seal unit

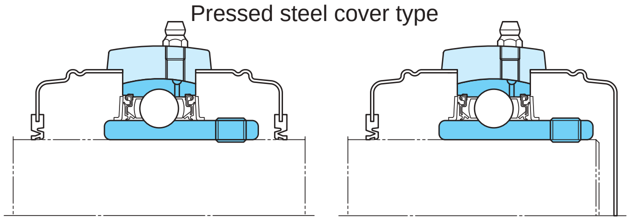
2 Unit with cover (supplementary code : C, D, FC, FD)

The unit with cover is equipped with the standard type housing and the pressed steel cover or cast iron cover, and features the double sealing structure of bearing and housing. The unit ensures a long service life of bearing even under severe environmental conditions such as dusts and mud water.

The unit with cover is available in two types : open ends type C type, FC type, closed end type D type, and FD type (for pillow block type unit, CD type or FCD type).

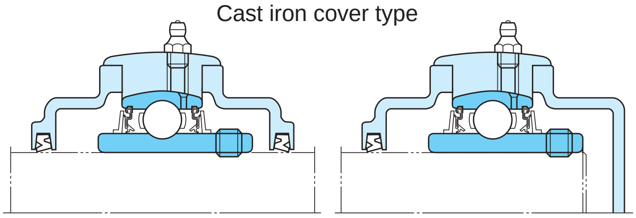
Pressed steel cover type



Open ends type

Closed end type

Cast iron cover type



Open ends type

Closed end type

Fig. 3.2 Type and structure of unit with cover

3 Heat resistant unit (special code : D1K2) and Cold resistant unit (special code : D2K2)

The operating temperature range of a insert bearing unit depends on the performance of grease and oil seal (rubber) used for the bearing. The operating temperature range of Koyo Insert Bearing Unit (standard type) ranges from –20 ℃ to 100 ℃.

If you use bearing units in the higher or lower temperature range beyond the operating temperature range of standard type, select the heat resistant (special code : D1K2) or the cold resistant unit (special code : D2K2).

Specifications of the heat resistant unit and the cold resistant unit are shown in **Table 3.3**.

Table 3.3 Specifications of heat resistant unit and cold resistant unit

Category	Special code	Operating temperature range (℃)	Grease	Oil seal rubber material	Bearing internal clearance	
					UC type	UK type
Standard	(no code)	–20 to 100	Alvania No. 2 or equivalence (lithium soap)	Nitrile	CN	C3
Heat resistant	D1K2	–40 to 180	SH44M (lithium soap)	Silicone	C4	C5
Cold resistant	D2K2	–50 to 120	SH33M (lithium soap)	Silicone	CN	C3

4 High speed unit (special code : K3)

The high speed unit (special code : K3) is the product that has been developed for intention of high speed and less heat. For the high speed unit bearing, the non-contact type oil seal optimal for high speed rotation and low torque is used.

This unit is intended for the purposes high speed rotation, low torque, and less heat are required, such as textile machinery and printing machinery.

5 Unit for blower (special code : S5)

The insert bearing unit for blower must meet requests for high speed rotation, less heat, less vibration, and low noise.

To meet with these requests for performance, JTEKT supplies the series of unit for blower (special code : S5) that the non-contact type oil seal is used, as well as improves the machining accuracy.

This unit is intended for the purposes high speed rotation, less heat, less vibration, low noise are required, such as a blower.

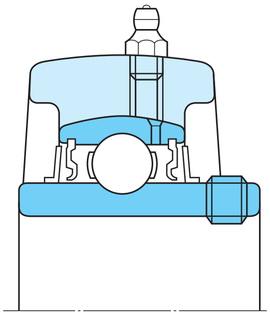


Fig. 3.3 Structure of bearing unit for blower

6 "Compact" series unit

For downsizing of machinery in facilities, the set screw method facilitating installation of the shaft is adopted for this unit.

The unit comprises the compact bearing and the special alloy housing.

Since the cover surface is coated with rubber, it contacts close with the housing well, and features superior dustproof and waterproof performance.

Operating temperature range : Standard temperature

7 Stainless-series unit (special code : S6)

The insert bearing units used for food machinery need waterproof performance.

For this purpose, JTEKT has released a series of Insert Bearing units of which bearings and housings are made of stainless steel in order to satisfy the required performance.

We can also provide bearing units packing grease applicable to use related to food certified by USDA (US Agriculture Department) H1.

Operating temperature range : From –20 ℃ to +100 ℃

* If you use this unit for machines splashed with water or in the environment that the operating temperature exceeds 50 ℃, it is recommended you use UC-S6 to be able to be lubricated for SU-S6.

4 Selection of unit

4.1 Outline of selection

Koyo Insert Bearing Units are available in various types and series. Therefore, to select the bearing unit optimal for design of machinery, various factors including the structure of machinery, operating conditions, performance required for bearing unit, specifications relative to the unit, marketability, and economic efficiency, must be comprehensively taken into consideration. Service life of the bearing greatly depends on the quality of selection.

Procedures of selection of standard insert bearing units are shown in **Table 4.1**.

Table 4.1 Procedures of selection of standard insert bearing units

Procedures of selection	Items to be examined	Operating conditions to be considered	Reference
1 Selection of type	· Pillow block type · Flange type · Take-up type · Cartridge type · Hanger type	Structure of machinery, mounting space, mounting dimensions	3 Types (P.13)
2 Selection of shaft dia. and dia. series	· Bearing bore dia. : From 10 to 140 mm · Dia. series : 0, 2, X, 3	Rating life of bearings required, load applied to bearings, rotational speed	5 Life of bearing (P.33) 6 Bearing load (P.38) 7 Allowable rotational speed (P.45)
3 Selection against atmosphere	· L3 (L2) type · Cover type · Stainless steel series · For high speed use · For blower	Environment (dusts, mud water, high humidity, chemicals), rotational speed	3 Types (P.13) (P.28) 7 Allowable rotational speed (P.45)
4 Selection against temperature	· Heat resistant type · Cold resistant type · Measures against expansion and contraction of shaft · Grease supply	Bearing temperature	3 Types (P.13) (P.28) 8 Operating temperature and bearing specifications (P.46) 10 Design of shaft and base (P.52) 14 Handling (P.66)
5 Selection of installing to shaft	· Set screw · Adapter · Eccentric locking collar	Rotational speed, load conditions, handling	3 Types (P.13) 14 Handling (P.66)
6 Selection of shafts	· Dimensional tolerance · Adoption of shouldered shaft · Provision of set screw for shaft · Measures against expansion and contraction of shaft	Rotational speed, load conditions, bearing temperature	3 Types (P.13) (P.28) 7 Allowable rotational speed (P.45) 10 Design of shaft and base (P.52) 14 Handling (P.66)
7 Selection of strength of housings	· Cast iron · Cast steel · Pressed steel	Load conditions, load directions, presence of impact	9 Strength of housing (P.47)
8 Selection of lubrication	· Lubricating type · Non-lubricating type · Centralized lubricating type · Greasing interval	Environment, importance of machine, bearing temperature, grease life	14 Handling (P.66)
9 Selection of maintenance and check	· Periodic inspection · Grease supply	Environment, importance of machine, bearing temperature, grease life	14 Handling (P.66)

4.2 Selection of type and specifications

Koyo Insert Bearing Units series are available in various types and specifications applicable to your purposes. Therefore, when selecting types and specifications of bearing unit, structure of machine, operating conditions, and environment must be fully taken into consideration for comprehensive examination.

Outline of selection of insert bearing unit types and specifications are shown in **Table 4.2**.

Table 4.2 (1) Outline of selection of insert bearing unit types and specifications

○ : Acceptable or Yes, × : Unacceptable or No

Category	Performance required		Bearing specifications			Applicable housing
	Operating conditions	Fixing to shaft	Sealing structure	Type code	Lubrication	
Bearing	Standard	Set screw Adapter	Oil seal and flinger	UC UK	○	C, F, FA, FB, FC, FL, FS, HA, IP, P, PA, PH, T, TH, TL, TU

4.3 Selection from a maintenance standpoint

Koyo Insert Bearing Units need not to be maintained or checked for standard purposes during operation, because of their structures. However, they must be periodically maintained or checked if they are used for important machines or under special environment.

Thus, it is important that intervals of periodic maintenance or check during operation are extended or insert bearing units optimal for purposes or operating conditions are selected in order to reduce the manpower required for maintenance and check.

For your purposes, various factors must be fully examined. In the environment exposed to vibration or impact, increase in safety factor of service life of the bearing, and strength of the housing must be fully examined. In the environment exposed to great axial load, use of shouldered shaft, in the environment exposed to dusts or mud water, use of the triple-lip seal type or covered type, in the environment exposed to high or low temperature, material of oil seal and grease type must be fully taken into consideration.

5 Life of bearing

If a insert bearing unit is installed to a machine or device and operated, vibration or noise from the unit may be increased or seizure may occur, after a certain period has passed, even under appropriate conditions. The period of bearing operation until the unit cannot be used due to these causes is called the life of insert bearing unit.

Life of a insert bearing unit is caused by two reasons, fatigue of bearing material (fatigue service life) and degradation of grease leading to faulty lubrication, and inability of continuous use. Each of them can be found as the rating life of bearing and grease life.

The life of insert bearing unit depends on the shorter one, between the rating life of bearing and grease life. Since the lubricating system is adopted for the Koyo Insert Bearing Unit, the grease life can be extended to the rating life of bearing by appropriate lubrication. If the bearing unit is used without lubrication, the shorter period, the rating life of bearing or grease life, is the life of the bearing unit.

However, a insert bearing unit is actually installed to a machine or device and operated, the unit cannot be used due to causes other than the rating life of bearing or grease service life (wear, dent, crack, seizure, etc.). They can be prevented by full examination of the selection, handling, installation, and lubrication of the insert bearing unit.

5.1 Basic rating life and basic rating load

5.1.1 Basic rating life

While a bearing is rotated under load, the raceways surfaces of the inner and outer rings of bearing and the rolling surfaces of rolling element are exposed to load continuously. Thus, damages like scales appear on the raceway surfaces or rolling surfaces due to fatigue of material (flaking or peel-off). The total number of revolution until the damages appear is called as "(Fatigue) service life" of bearing. Fatigue service life of bearing may be greatly varied even if the bearings having the same structure, dimensions, materials, and machining methods, are operated under the same operating conditions.

To solve this problem, if a group of the same bearings are operated under the same conditions, the total number of revolution of 90% of the bearings without damage due to rotating fatigue (life of 90% reliability) is called as the **"Basic rating life of bearing"**.

5.1.2 Basic rating load

Basic rating load indicates the withstanding strength against rolling fatigue of a bearing, that is to say, loading capacity. It is the pure radial load of a certain level and direction (for radial bearing) or central axial load (for thrust bearing) that a million times of rotations can be obtained as the basic rating life if the inner ring of bearing is rotated while the outer ring is stopped (or the outer ring is rotated while the inner ring is stopped).

They are called as the **basic dynamic radial load rating** (C_r) for radial bearing or the **basic dynamic axial load rating** (C_a) for axial bearings.

In the insert bearing for insert bearing unit, it is indicated as the basic dynamic radial load rating (C_r), and the value is shown in the dimensional table.

5.2 Calculation of rating life

Relation between the basic rating life, basic dynamic load rating, and the dynamic equivalent load of the insert bearing for insert bearing unit can be indicated as the **Equation (5.1)**. If the insert bearing unit is used at a fixed rotational speed, it is convenient that the life is indicated as time, as shown in the **Equation (5.2)**.

(Total revolution) $$L_{10} = \left(\frac{C_r}{P_r}\right)^3 \quad \cdots\cdots (5.1)$$

(Time) $$L_{10h} = \frac{10^6}{60n}\left(\frac{C_r}{P_r}\right)^3 \quad \cdots\cdots (5.2)$$

Whereas,

L_{10}	: Basic rating life	10^6 rotations
L_{10h}	: Basic rating life	h
C_r	: Basic dynamic load rating	N
P_r	: Dynamic equivalent load (see **"6 Bearing load"**)	N
n	: Rotational speed	min^{-1}

Calculation of the basic rating life with using the life factor (f_h) and the speed factor (f_n) in the **Equation (5.2)** are shown below.

$$L_{10h} = 500\ f_h^3 \quad \cdots\cdots (5.3)$$

Life factor $$f_h = f_n \cdot \frac{C_r}{P_r} \quad \cdots\cdots (5.4)$$

Speed factor $$f_n = \left(\frac{10^6}{500 \times 60n}\right)^{1/3} = (0.03n)^{-1/3} \quad \cdots\cdots (5.5)$$

Values of f_n, f_h and L_{10h} can be easily found by the nomogram of **Fig. 5.1**.

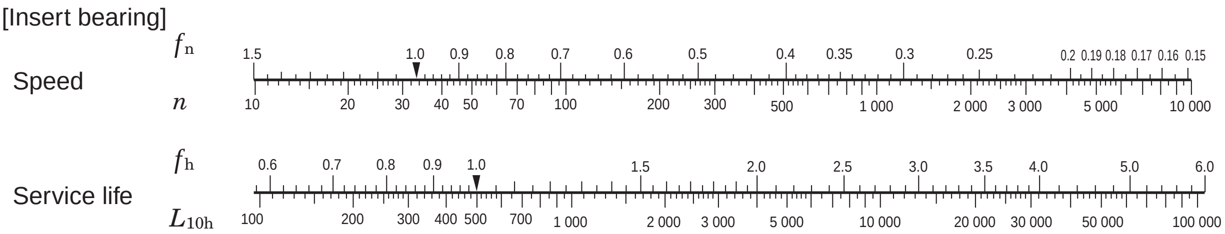

Fig. 5.1 Rotational speed (n) and its coefficients (f_n), and service life coefficient (f_h) and basic rating life (L_{10h})

5.2.1 Correction of basic rating load for high temperature use

If a insert bearing unit is used at a high temperature, structure of bearing material is changed, leading to decreased hardness, and the basic dynamic load rating is reduced than that of the use at standard temperature. Once the structure of bearing material is changed, it will not be restored even if the temperature returns to standard level.

Therefore, when using a insert bearing unit at 150 ℃ or more, the basic rating load must be corrected by multiplying the basic dynamic load rating shown in dimensional table by the temperature factor shown in **Table 5.1**.

If the insert bearing unit has been used for a long period at 120 ℃ or more, fluctuations in dimensions of the bearing may be increased. If you use it under such conditions, contact JTEKT.

Table 5.1 Temperature factor

Bearing temperature, ℃	**125**	**150**	**175**	**200**	**250**
Temperature factor	1	1	0.95	0.90	0.75

5.2.2 Modified rating life L_{nm}

The life of rolling bearings was standardized as a basic rating life in the 1960s, but in actual applications, sometimes the actual life and the basic rating life have been quite different due to the lubrication status and the influence of the usage environment. To make the calculated life closer to the actual life, a corrected rating life has been considered since the 1980s. In this corrected rating life, bearing characteristic factor a_2 (a correction factor for the case in which the characteristics related to the life are changed due to the bearing materials, manufacturing process, and design) and usage condition factor a_3 (a correction factor that takes into account usage conditions that have a direct influence on the bearing life, such as the lubrication) or factor a_{23} formed from the interdependence of these two factors, are considered with the basic rating life. These factors were handled differently by each bearing manufacturer, but they have been standardized as a modified rating life in **ISO 281** in 2007. In 2013, **JIS B 1518** (dynamic load ratings and rating life) was amended to conform to the **ISO**.

The basic rating life (L_{10}) shown in **Equation (5.1)** is the (fatigue) life with a dependability of 90 % under normal usage conditions for rolling bearings that have standard factors such as internal design, materials, and manufacturing quality. **JIS B 1518**:2013 specifies a calculation method based on **ISO 281**:2007. To calculate accurate bearing life under a variety of operating conditions, it is necessary to consider elements such as the effect of changes in factors that can be anticipated when using different reliabilities and system approaches, and interactions between factors. Therefore, the specified calculation method considers additional stress due to the lubrication status, lubricant contamination, and fatigue load limit C_u (refer to P.36) on the inside of the bearing. The life that uses this life modification factor a_{ISO}, which considers the above factors, is called modified rating life L_{nm} and is calculated with the following **Equation (5.6)**.

$$L_{nm} = a_1 a_{ISO} L_{10} \quad \cdots\cdots (5.6)$$

In this equation,

L_{nm} : Modified rating life 10^6 rotations

(This rating life has been modified for one of or a combination of the following: reliability of 90 % or higher, fatigue load limit, special bearing characteristics, lubrication contamination, and special operating conditions.)

L_{10} : Basic rating life 10^6 rotations
(reliability: 90 %)

a_1 : Life modification factor for reliability
.... refer to section (1)

a_{ISO} : Life modification factor
.... refer to section (2)

[Remark] When bearing dimensions are to be selected given L_{nm} greater than 90 % in reliability, the strength of shaft and housing must be considered.

(1) Life modification factor for reliability a_1

The term “reliability” is defined as “for a group of apparently identical rolling bearings, operating under the same conditions, the percentage of the group that is expected to attain or exceed a specified life” in **ISO 281**:2007. Values of a_1 used to calculate a modified rating life with a reliability of 90 % or higher (a failure probability of 10 % or less) are shown in **Table 5.2**.

Table 5.2 Life modification factor for reliability a_1

Reliability, %	L_{nm}	a_1
90	L_{10m}	1
95	L_{5m}	0.64
96	L_{4m}	0.55
97	L_{3m}	0.47
98	L_{2m}	0.37
99	L_{1m}	0.25
99.2	$L_{0.8m}$	0.22
99.4	$L_{0.6m}$	0.19
99.6	$L_{0.4m}$	0.16
99.8	$L_{0.2m}$	0.12
99.9	$L_{0.1m}$	0.093
99.92	$L_{0.08m}$	0.087
99.94	$L_{0.06m}$	0.080
99.95	$L_{0.05m}$	0.077

(Citation from **JIS B 1518**:2013)

(2) Life modification factor $a_{\rm ISO}$

a) System approach

The various influences on bearing life are dependent on each other. The system approach of calculating the modified life has been evaluated as a practical method for determining life modification factor $a_{\rm ISO}$ (ref. **Fig. 5.2**). Life modification factor $a_{\rm ISO}$ is calculated with the following equation. A diagram is available for each bearing type (radial ball bearings, radial roller bearings, thrust ball bearings, and thrust roller bearings). (Each diagram (**Figs. 5.3** to **5.6**) is a citation from **JIS B 1518**:2013.)

Note that in practical use, this is set so that life modification factor $a_{\rm ISO}$ ≧ 50.

$$a_{\rm ISO} = f\left(\frac{e_{\rm c}C_{\rm u}}{P}, \kappa\right) \quad \cdots\cdots\cdots\cdots\cdots\cdots \quad (5.7)$$

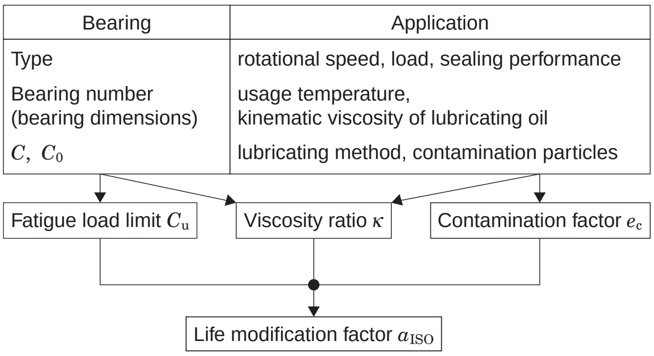

Fig. 5.2 System approach

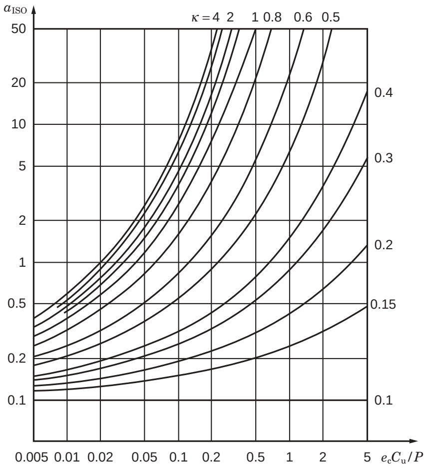

Fig. 5.3 Life modification factor $a_{\rm ISO}$ (Radial ball bearings)

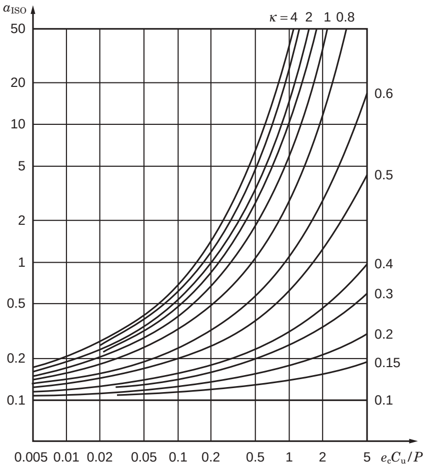

Fig. 5.4 Life modification factor $a_{\rm ISO}$ (Radial roller bearings)

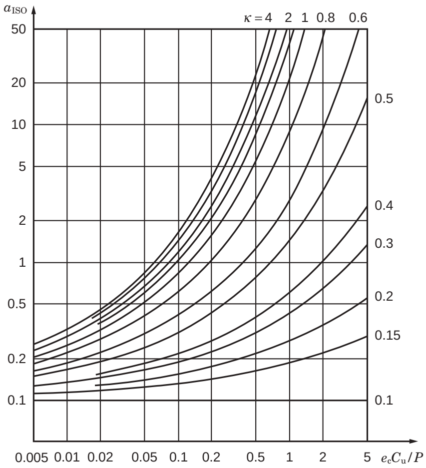

Fig. 5.5 Life modification factor $a_{\rm ISO}$ (Thrust ball bearings)

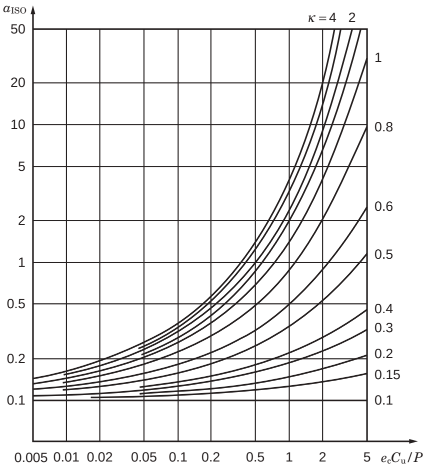

Fig. 5.6 Life modification factor $a_{\rm ISO}$ (Thrust roller bearings)

(**Figs. 5.3** to **5.6** Citation from **JIS B 1518**:2013)

b) Fatigue load limit C_u

For regulated steel materials or alloy steel that has equivalent quality, the fatigue life is unlimited so long as the load condition does not exceed a certain value and so long as the lubrication conditions, lubrication cleanliness class, and other operating conditions are favorable. For general high-quality materials and bearings with high manufacturing quality, the fatigue stress limit is reached at a contact stress of approximately 1.5 GPa between the raceway and rolling elements. If one or both of the material quality and manufacturing quality are low, the fatigue stress limit will also be low.

The term "fatigue load limit" C_u is defined as "bearing load under which the fatigue stress limit is just reached in the most heavily loaded raceway contact" in **ISO 281**: 2007. and is affected by factors such as the bearing type, size, and material.

For details on the fatigue load limits of special bearings and other bearings not listed in this catalog, contact JTEKT.

c) Contamination factor e_c

If solid particles in the contaminated lubricant are caught between the raceway and the rolling elements, indentations may form on one or both of the raceway and the rolling elements. These indentations will lead to localized increases in stress, which will decrease the life. This decrease in life attributable to the contamination of the lubricant can be calculated from the contamination level as contamination factor e_c.

D_{pw} shown in this table is the pitch diameter of ball/roller set, which is expressed simply as $D_{pw} = (D + d)/2$. (D: Outside diameter, d: Bore diameter)

For information such as details on special lubricating conditions or detailed investigations, contact JTEKT.

d) Viscosity ratio κ

The lubricant forms an oil film on the roller contact surface, which separates the raceway and the rolling elements. The status of the lubricant oil film is expressed by viscosity ratio κ, the actual kinematic viscosity at the operating temperature ν divided by the reference kinematic viscosity ν_1 as shown in the following equation.

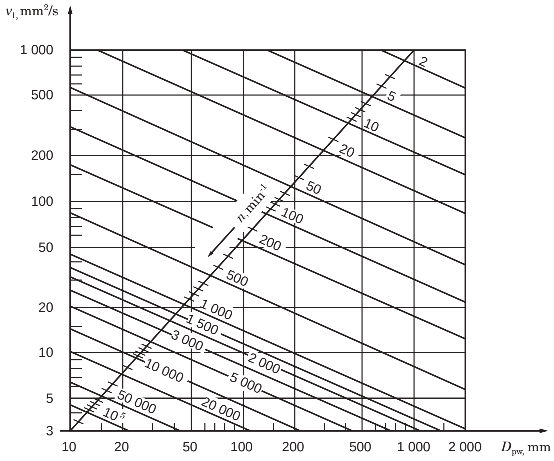
A κ greater than 4, equal to 4, or less than 0.1 is not applicable.

For details on lubricants such as grease and lubricants with extreme pressure additives, contact JTEKT.

$$\kappa = \frac{\nu}{\nu_1} \quad \cdots\cdots \quad (5.8)$$

ν : Actual kinematic viscosity at the operating temperature; the viscosity of the lubricant at the operating temperature

ν_1 : Reference kinematic viscosity; determined according to the speed and pitch diameter of ball/roller set D_{pw} of the bearing (ref. **Fig. 5.7**)



(**Fig. 5.7** Citation from **JIS B 1518**:2013)

Fig. 5.7 Reference kinematic viscosity ν_1

5.2.3 Service life of bearing system comprising two or more bearings

Even for systems which comprise two or more bearings, if one bearing is damaged, the entire system malfunctions.

Where all bearings used in an application are regarded as one system, the service life of the bearing system can be calculated using the following equation,

Table 5.3 Values of contamination factor e_c

Contamination level	e_c	
	D_{pw} < 100 mm	D_{pw} ≧ 100 mm
Extremely high cleanliness: The size of the particles is approximately equal to the thickness of the lubricant oil film, this is found in laboratory-level environments.	1	1
High cleanliness: The oil has been filtered by an extremely fine filter, this is found with standard grease-packed bearings and sealed bearings.	0.8 to 0.6	0.9 to 0.8
Standard cleanliness: The oil has been filtered by a fine filter, this is found with standard grease-packed bearings and shielded bearings.	0.6 to 0.5	0.8 to 0.6
Minimal contamination: The lubricant is slightly contaminated.	0.5 to 0.3	0.6 to 0.4
Normal contamination: This is found when no seal is used and a coarse filter is used in an environment in which wear debris and particles from the surrounding area penetrate into the lubricant.	0.3 to 0.1	0.4 to 0.2
High contamination: This is found when the surrounding environment is considerably contaminated and the bearing sealing is insufficient.	0.1 to 0	0.1 to 0
Extremely high contamination	0	0

(**Table 5.3** Citation from **JIS B 1518**:2013)

$$\frac{1}{L^e} = \frac{1}{L_1{}^e} + \frac{1}{L_2{}^e} + \frac{1}{L_3{}^e} + \cdots\cdots\cdots\cdots \quad (5.9)$$

where :

L : rating life of system

L_1, L_2, L_3 ······ : rating life of each bearing

e : constant

e = 10/9······ball bearing
e = 9/8······roller bearing
The mean value is for a system using both ball and roller bearings.

[Example]

When a shaft is supported by two roller bearings whose service lives are 50 000 hours and 30 000 hours respectively, the rating life of the bearing system supporting this shaft is calculated as follows, using **Equation (5.9)** :

$$\frac{1}{L^{9/8}} = \frac{1}{50\,000^{9/8}} + \frac{1}{30\,000^{9/8}}$$

$$L \fallingdotseq 20\,000 \text{ h}$$

The equation suggests that the rating life of these bearings as a system becomes shorter than that of the bearing with the shorter life.

This fact is very important in estimating bearing service life for applications using two or more bearings.

5.2.4 Recommended service life of bearing

Excessively long life of insert bearing unit does not lead to economic operation. Setup of the recommended service life of bearing unit depending on the type of machine the insert bearing unit is used together and operating conditions is required.

Recommended service life of insert bearing unit empirically adopted is shown in **Table 5.4**.

Table 5.4 Recommended service life of insert bearing unit (reference)

Operating conditions	Application	Recommended service life, h
Operated in short period or intermittently	Home electric appliances, electric tool, agricultural machinery, hoist, etc.	4 000 – 8 000
Discontinuously but for a long period	Factory motor, general gear, etc.	12 000 – 20 000
Always operated for 8 hours or longer a day or operated continuously for a long period	General machinery, blower, etc.	20 000 – 30 000
Operated continuously for 24 hours, no fault is allowed	Electric power plant facility, mine drainage facility, etc.	100 000 –200 000

5.3 Grease life

Grease life of a insert bearing for insert bearing unit is influenced by the level of load, rotational speed of bearing, and operating temperature.

Grease life of a insert bearing for unit used under appropriate operating conditions can be found by the equation shown below.

$$\log L = 6.10 - 4.40 \times 10^{-6}\, d_{\mathrm{m}} n - 2.50 \left(\frac{P_{\mathrm{r}}}{C_{\mathrm{r}}} - 0.05 \right)$$

$$- (0.021 - 1.80 \times 10^{-8}\, d_{\mathrm{m}} n)\, T \;\cdots\cdots\cdots\cdots \quad (5.10)$$

Whereas,

L : Grease life h

d_{m} : Pitch dia. of ball set mm

$$d_{\mathrm{m}} = \frac{(D+d)}{2}$$

D : Nominal bearing outer dia.,
d : Nominal bearing bore dia.

n : Rotational speed of bearing min^{-1}

P_{r} : Dynamic equivalent radial load N
(see **"6 Bearing load"**)

C_{r} : Basic dynamic radial load rating of bearing N

T : Operating temperature of bearing °C

Applicable conditions for the **Equation (5.10)** are shown below.

1) Operating temperature of bearing : T °C

To be applied if the following condition is satisfied : $T \leqq 100$

If T is smaller than 50 ($T < 50$), following condition should be applied : $T = 50$.

If T is larger than 100 ($T > 100$), contact JTEKT.

2) Rotationl speed of bearing : $d_{\mathrm{m}} n$

To be applied if the following condition is satisfied : $d_{\mathrm{m}} n \leqq 30 \times 10^4$

If $d_{\mathrm{m}} n$ is smaller than 12.5×10^4 ($d_{\mathrm{m}} n < 12.5 \times 10^4$), following condition should be applied : $d_{\mathrm{m}} n = 12.5 \times 10^4$

If $d_{\mathrm{m}} n$ is larger than 30×10^4 ($d_{\mathrm{m}} n > 30 \times 10^4$), contact JTEKT.

3) Load condition of bearing : $\frac{P_{\mathrm{r}}}{C_{\mathrm{r}}}$

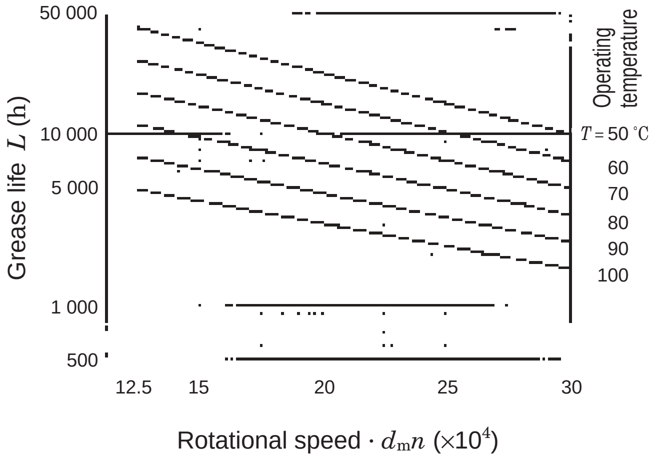
To be applied if the following condition is satisfied : $\frac{P_{\mathrm{r}}}{C_{\mathrm{r}}} \leqq 0.2$

If $\frac{P_{\mathrm{r}}}{C_{\mathrm{r}}}$ is smaller than 0.05 ($\frac{P_{\mathrm{r}}}{C_{\mathrm{r}}} < 0.05$), following condition should be applied : $\frac{P_{\mathrm{r}}}{C_{\mathrm{r}}} = 0.05$

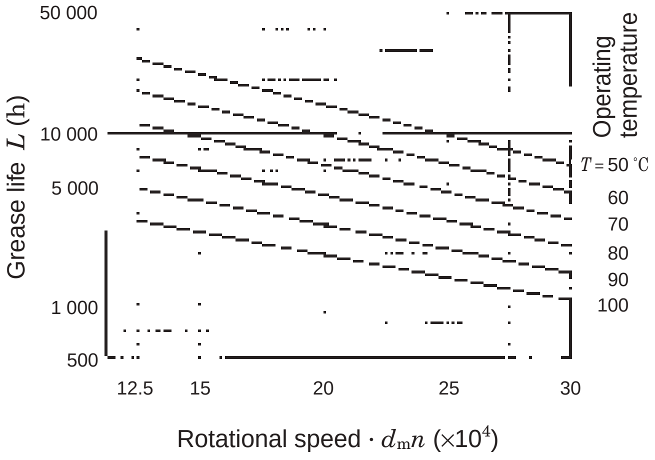
If $\frac{P_{\mathrm{r}}}{C_{\mathrm{r}}}$ is larger than 0.2 ($\frac{P_{\mathrm{r}}}{C_{\mathrm{r}}} > 0.2$), contact JTEKT.

Reference figure of grease life obtained by the **Equation (5.10)** is shown in **Fig. 5.8**.

(1) Bearing load · $\frac{P_r}{C_r} = 0.05$



(2) Bearing load · $\frac{P_r}{C_r} = 0.125$



(3) Bearing load · $\frac{P_r}{C_r} = 0.2$

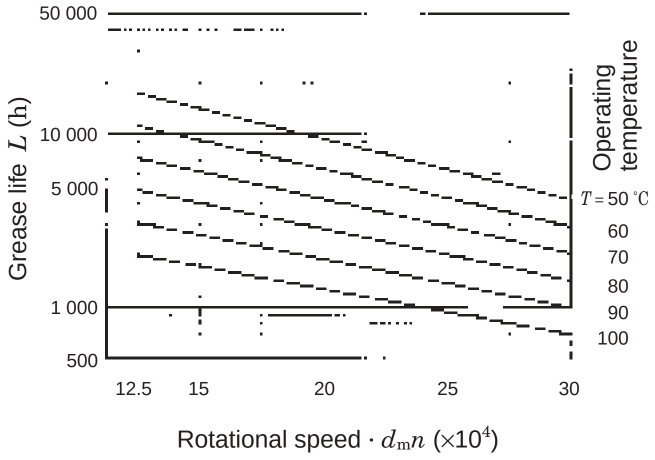


Fig. 5.8 Relation of grease life to bearing load, rotational speed, and operating temperature (reference)

6 Bearing load

As for the loads applied to a bearing, load caused by weight of object supported by the bearing, transmitting force of gears and belts, load generated in the machine operated are included. In many cases, these loads cannot be found out by simple calculation.

Because the loads are not fixed but fluctuated, and it is difficult to fix the level and direction of the fluctuations.

Therefore, in general, to find the loads applied to a bearing, the following steps are adopted : multiply the load to be able to be found theoretically by various factors obtained empirically.

6.1 Loads applied to bearing

6.1.1 Load factor

Even if radial load and axial load to be applied to a bearing can be found by standard dynamical calculation, loads actually applied to the bearing are greater than the calculated values because of vibration and impact generated while machine is being operated.

To find the loads actually applied to a bearing, multiply the theoretically found values by load factor.

$$F = f_w \cdot F_c \quad \cdots\cdots (6.1)$$

Whereas,

F : Load actually applied to bearing N
F_c : Theoretically calculated load N
f_w : Load factor (see **Table 6.1**)

Table 6.1 Load factor f_w

Operating conditions	Applications	f_w
Virtually no vibration or impact	Electric machines and instruments	1 – 1.2
Standard operation (weak impact)	Agricultural machines and blower	1.2 – 2
Great vibration and impact	Constructive machines and grinder	2 – 3

6.1.2 Loads in case of belt or chain transmission

As for belt transmission, theoretical load applied to the pulley shaft can be found by effective transmission force of belt. Actually, the effective transmission force must be multiplied by load factor (f_w) obtained with taking vibration and impact generated while machine is being operated into consideration and belt factor (f_b) with taking belt tension into consideration.

As for chain transmission, factor equivalent to the belt factor for belt transmission must be multiplied.

$$F_b = \frac{2M}{D_p} \cdot f_w \cdot f_b$$

$$= \frac{19.1 \times 10^6\,W}{D_p \cdot n} \cdot f_w \cdot f_b \quad \cdots\cdots\cdots (6.2)$$

Whereas,

F_b : Load actually applied to pulley shaft or sprocket shaft N
M : Torque applied to pulley or sprocket mN · m
W : Transmitted power kW
D_p : Pitch circle dia. of pulley or sprocket mm
n : Rotational speed min^{-1}
f_w : Load factor (see **Table 6.1**)
f_b : Belt factor (see **Table 6.2**)

Table 6.2 Belt factor f_b

Belt type	f_b
Toothed belt	1.3 – 2
V belt	2 – 2.5
Flat belt (with tension pulley)	2.5 – 3
Flat belt	4 – 5
Chain	1.2 – 1.5

6.1.3 Load in case of gear transmission

As for gear transmission, load in tangential direction (K_t), load in radial direction (K_r), and axial load (K_a) are included as the theoretical loads applied to a gear. They can be dynamically found by transmission force and gear type.

The followings show the example of standard flat gear (as for flat gear, no axial load applied is expected.).

(1) Load applied to gear in tangential direction (tangential line force)

$$K_t = \frac{2\,M}{D_p} = \frac{19.1 \times 10^6\,W}{D_p n} \quad \cdots\cdots\cdots (6.3)$$

(2) Load applied to gear in radial direction (separating force)

$$K_r = K_t \tan\alpha \quad \cdots\cdots\cdots (6.4)$$

(3) Synthetic load applied to gear

$$K_g = \sqrt{K_t^2 + K_r^2} = K_t \sec\alpha \quad \cdots\cdots\cdots (6.5)$$

Whereas,

K_t : Load applied to gear in tangential direction (tangential line force) N
K_r : Load applied to gear in radial direction (separating force) N
K_g : Synthetic load applied to gear N
M : Torque applied to gear mN · m
D_p : Pitch circle dia. of gear mm
W : Transmission power kW
n : Rotational speed min^{-1}
α : Pressure angle of gear deg

Note that the actual gear load must be found by multiplying the theoretical load by load factor (f_w) obtained with taking vibration and impact generated while machine is being operated into consideration and gear factor (f_g) with taking accuracy and finish of gear into consideration.

$$F_g = f_w \cdot f_g \cdot K_g \quad \cdots\cdots\cdots (6.6)$$

Whereas,

F_g : Load actually applied to gear N
K_g : Theoretically synthetic load applied to gear N
f_w : Load factor (see **Table 6.1**)
f_g : Gear factor (see **Table 6.3**)

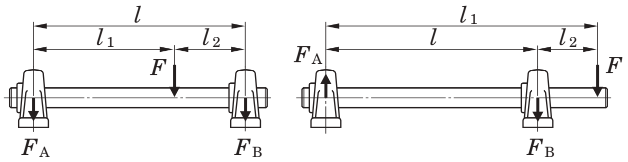
Table 6.3 Gear factor f_g

Gear type	f_g
Precision gear (both pitch error and tooth profile error should be 0.02 mm or less)	1 – 1.1
Standard gear (both pitch error and tooth profile error should be 0.1 mm or less)	1.1 – 1.3

6.2 Distribution of load to bearing

To distribute the load applied to the shaft system into the bearing which supports the shaft, find the radial component force of each load, and calculate the vector sum in accordance with the direction of load. **Fig. 6.1** shows the example of distribution of radial load.

In many cases, a bearing bears radial load as well as axial load, leading to synthetic loads. In such a case, convert it into dynamic equivalent load, and consider it as the bearing load.



$$F_A = \frac{l_2}{l} \cdot F \quad \cdots\cdots (6.7)$$

$$F_B = \frac{l_1}{l} \cdot F \quad \cdots\cdots (6.8)$$

Fig. 6.1 Distribution of load to bearing

6.3 Dynamic equivalent load

In many cases, a bearing is exposed to the synthetic load of radial load and axial load, and it is used under various conditions, including fluctuated load thus, the load actually applied to the bearing cannot be directly compared to the basic dynamic load rating.

In such a case, find the load running the bearing center in a fixed level and direction that allows the same bearing life as the actual bearing load and rotational speed. Then, compare it with the basic dynamic load rating.

The converted virtual load is called dynamic equivalent load (P).

6.3.1 Calculation of dynamic equivalent load

The dynamic equivalent radial load (P_r) of a radial bearing (insert bearing for unit is included) that bears the synthetic load in a fixed level and direction can be found by the equation shown below.

$$P_r = XF_r + YF_a \quad \cdots\cdots (6.9)$$

Whereas,

P_r : Dynamic equivalent radial load N
F_r : Radial load N
F_a : Axial load N
X : Radial load factor (see **Table 6.4**)
Y : Axial load factor (see **Table 6.4**)

Table 6.4 Radial load factor (X) and axial load factor (Y)

$\frac{f_0 F_a}{C_{0r}}$	e	$F_a / F_r \leqq e$		$F_a / F_r > e$	
		X	Y	X	Y
0.172	0.19	1	0	0.56	2.30
0.345	0.22				1.99
0.689	0.26				1.71
1.03	0.28				1.55
1.38	0.30				1.45
2.07	0.34				1.31
3.45	0.38				1.15
5.17	0.42				1.04
6.89	0.44				1.00

[Remarks] 1. C_{0r} (basic static radial load rating) and f_0 (factor) are shown in the dimensional tables.
2. If $f_0 F_a / C_{0r}$ does not conform to the table above, find by interpolation.

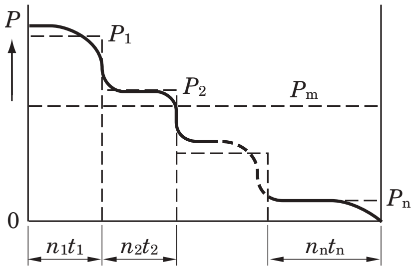
6.3.2 Mean dynamic equivalent load in case of fluctuated load

If level or direction of the load applied to a bearing is fluctuated, it is necessary to find the mean dynamic equivalent load to allow the same bearing life as that under actual fluctuated conditions.

Table 6.5 shows the method of finding the mean dynamic equivalent load under various fluctuated conditions.

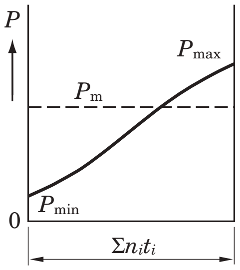
Table 6.5 Calculation of mean dynamic equivalent load in case of fluctuated load

(1) Staged fluctuation



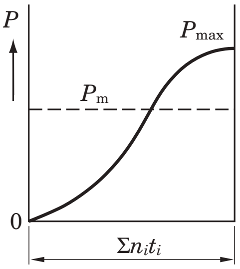
$$P_m = \sqrt[p]{\frac{P_1{}^p\, n_1t_1 + P_2{}^p\, n_2t_2 + \cdots\cdots + P_n{}^p\, n_nt_n}{n_1t_1 + n_2t_2 + \cdots\cdots + n_nt_n}}$$ ……………… (6.10)

(2) Stageless fluctuation



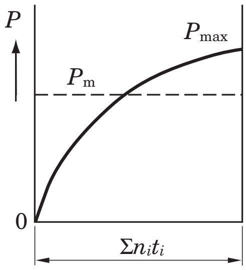
$$P_m = \frac{P_{min} + 2\,P_{max}}{3}$$ ………………………………………… (6.11)

(3) Sine curve fluctuation



$P_m = 0.68\ P_{max}$ ………………………………………………… (6.12)

(4) Sine curve fluctuation (upper half of sine curve)



$P_m = 0.75\ P_{max}$ ………………………………………………… (6.13)

Whereas,

P_m : Mean dynamic equivalent load N

P_1 : Dynamic equivalent load actuating for t_1 hours at rotational speed of n_1 N

P_2 : Dynamic equivalent load actuating for t_2 hours at rotational speed of n_2 N

·
·
·

P_n : Dynamic equivalent load actuating for t_n hours at rotational speed of n_n N

P_{min} : Minimum dynamic equivalent load N

P_{max} : Maximum dynamic equivalent load N

$\Sigma n_i t_i$: Total rotating frequency for t_1 to t_i hours

6.4 Basic static load rating and static equivalent load

6.4.1 Basic static load rating

If a bearing is exposed to excessive static load or impact load even under extra low rotational speed, partial permanent deformation occurs to the contact surface of the raceway of bearing with the rolling element. The permanent deformation increases with the increase of load, and when it exceeds a fixed level, smooth rotation of the bearing is interfered.

Basic static load rating of a bearing is the static load to generate the calculated contact stress shown below at the center of contact surface of the raceway the maximum load is applied and the rolling element.

(1) Self-aligning ball bearing .... 4 600 MPa
(2) Other ball bearings
 (insert bearing for unit is included) .... 4 200 MPa
(3) Roller bearing .... 4 000 MPa

The total permanent deformation of bearing raceway and rolling element to be generated under these contact stresses are 0.000 1 times of the diameter of rolling element.

In the insert bearing for unit, it is indicated as the **basic static radial load rating** (C_{0r}), and the values are shown in the dimensional tables.

6.4.2 Static equivalent load

Static equivalent load is the virtual load converted into the level that allows the generation of the same contact stress at the contact face of the raceway of bearing and rolling element that are exposed to the maximum stress as the contact stress under the actual load conditions, when a bearing is stopped or rotated at extra low speed.

Static equivalent radial load (P_{or}) of the insert bearing for unit can be calculated by the equation below (use greater value).

$$P_{0r} = 0.6F_r + 0.5F_a \quad \cdots\cdots (6.14)$$

$$P_{0r} = F_r \quad \cdots\cdots (6.15)$$

Whereas,

P_{0r}	: Static equivalent radial load	N
F_r	: Radial load	N
F_a	: Axial load	N

6.4.3 Safety factor

The static equivalent load allowed by a bearing depends on the basic static load rating of the bearing, and the limitation of use of bearing by the permanent deformation (partial dent) of the bearing depends on the performance required for the bearing or operating conditions.

Therefore, in order to examine the safety of the basic static load rating of the bearing, safety factor is defined taking conventional experiences into consideration.

$$f_s = \frac{C_{0r}}{P_{0r}} \quad \cdots\cdots (6.16)$$

Whereas,

f_s	: Safety factor (see **Table 6.6**)	
C_{0r}	: Basic static radial load rating	N
P_{0r}	: Static equivalent radial load	N

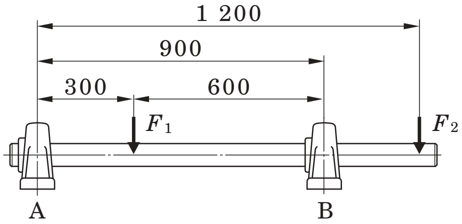
Table 6.6 Safety factor f_s (recommended)

Operating conditions		f_s (Min.)
Being rotated	High rotating accuracy is required	2
	Standard operating conditions	1
	Impact	1.5
Not always being rotated (sometimes oscillated)	Standard operating conditions	0.5
	Impact, unevenly distributed load	1

6.5 Example of applied calculation

Example 1 Distributing load

Find the load applied to the bearing A and bearing B, if the radial load F_1 ($F_1 = 1.5$ kN) and F_2 ($F_2 = 4.5$ kN) are applied.



(1) Find the radial load F_{1A} applied to the bearing A by F_1, with **Equations (6.7)** and **(6.8)**.

$$F_{1A} = \frac{600}{900} \times 1.5 = 1.0 \text{ (kN)}$$

In a similar manner, find the radial load F_{2A} applied to the bearing A by F_2.

$$F_{2A} = -\frac{1\,200 - 900}{900} \times 4.5 = -1.5 \text{ (kN)}$$

[Remark] Negative load is the upward load.

Radial load F_A applied to the bearing A :

$$F_A = F_{1A} + F_{2A} = 1.0 + (-1.5) = -0.5 \text{ (kN)}$$

(2) In a similar manner to (1), find the radial load F_B applied to the bearing B.

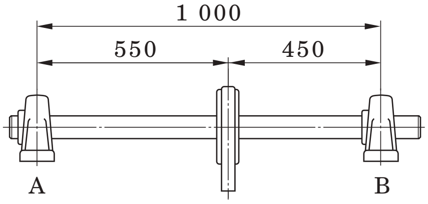
$$F_{1B} = \frac{300}{900} \times 1.5 = 0.5 \text{ (kN)}$$

$$F_{2B} = \frac{1\,200}{900} \times 4.5 = 6.0 \text{ (kN)}$$

$$F_B = F_{1B} + F_{2B} = 0.5 + 6.0 = 6.5 \text{ (kN)}$$

Example 2 Calculating load by V-belt transmission

Find the load applied to the bearing A and bearing B when the shaft is driven by the V-belt, transmission power W is 7.5 kW ($W = 7.5$ kW), rotational speed n is 300 min^{-1} ($n = 300$ min^{-1}), effective diameter of pulley D_p is 300 mm ($D_\mathrm{p} = 300$ mm).



(1) Find the load actually applied to the pulley shaft F_b with **Equation (6.2)**.

From **Table 6.1**, load factor f_w is 1.2 ($f_\mathrm{w} = 1.2$), and the belt factor f_b is 2.5 ($f_\mathrm{b} = 2.5$), from **Table 6.2**.

$$F_\mathrm{b} = \frac{19.1 \times 10^6\, W}{D_\mathrm{p} \cdot n} \cdot f_\mathrm{w} \cdot f_\mathrm{b}$$

$$= \frac{19.1 \times 10^6 \times 7.5}{300 \times 300} \times 1.2 \times 2.5 = 4.78 \text{ (kN)}$$

(2) Find the load actually applied to the bearing A and bearing B (F_A and F_B) with **Equations (6.7)** and **(6.8)**.

$$F_\mathrm{A} = \frac{450}{1\,000} \times 4.78 = 2.15 \text{ (kN)}$$

$$F_\mathrm{B} = \frac{550}{1\,000} \times 4.78 = 2.63 \text{ (kN)}$$

Example 3 Calculating dynamic equivalent radial load

Find the dynamic equivalent radial load P_r when the radial load F_r, 1.5 kN ($F_\mathrm{r} = 1.5$ kN), and the axial load F_a, 0.85 kN, ($F_\mathrm{a} = 0.85$ kN) are applied to the pillow block type unit UCP306J (bearing UC306).

(1) Find the radial load factor (X) and the axial load factor (Y) with using the static radial load rating $C_{0\mathrm{r}}$ of UCP306J (bearing UC306), 15.0 kN ($C_{0\mathrm{r}} = 15.0$ kN), and **Table 6.4**.

$$\frac{f_0\, F_\mathrm{a}}{C_{0\mathrm{r}}} = \frac{13.3 \times 0.85}{15.0} = 0.754,\ e = 0.264$$

$$\frac{F_\mathrm{a}}{F_\mathrm{r}} = \frac{0.85}{1.5} = 0.567 > e\ (0.264)$$

Therefore, $X = 0.56$, $Y = 1.68$

(2) Find the dynamic equivalent radial load P_r with **Equation (6.9).**

$$P_\mathrm{r} = XF_\mathrm{r} + YF_\mathrm{a} = 0.56 \times 1.5 + 1.68 \times 0.85$$

$$= 2.27 \text{ (kN)}$$

Example 4 Calculating bearing life

Under the conditions shown in the **Example 3**, find the bearing life $L_{10\mathrm{h}}$ when a bearing is used for a blower of the rotational speed n, 1 000 min^{-1}.

(1) Select the load factor f_w is 1.2 ($f_\mathrm{w} = 1.2$) from **Table 6.1**, and find the bearing load P_r.

$$P_\mathrm{r} = f_\mathrm{w} \cdot F = 1.2 \times 2.27 = 2.72 \text{ (kN)}$$

(2) The dynamic radial load rating of UCP306J (bearing UC306), C_r, is 26.7 kN ($C_\mathrm{r} = 26.7$ kN), and calculate the bearing life $L_{10\mathrm{h}}$ with the **Equation (5.2)**.

$$L_{10\mathrm{h}} = \frac{10^6}{60n} \cdot \left(\frac{C_\mathrm{r}}{P_\mathrm{r}}\right)^3 = \frac{10^6}{60 \times 1\,000} \times \left(\frac{26.7}{2.72}\right)^3$$

$$\fallingdotseq 15\,800 \text{ (h)}$$

(3) Calculate bearing life $L_{10\mathrm{h}}$ with the nomogram shown in **Fig. 5.1**.

When the rotational speed n is 1 000 min^{-1} ($n = 1\,000$ min^{-1}), rotational factor f_n is 0.32 ($f_\mathrm{n} = 0.32$). next, find the life factor f_h by speed factor f_n, dynamic radial load rating of bearing C_r, and the bearing load P_r.

$$\text{Life factor } f_\mathrm{h} = f_\mathrm{n} \cdot \frac{C_\mathrm{r}}{P_\mathrm{r}} = 0.32 \times \frac{26.7}{2.72}$$

$$= 3.14$$

From life factor f_h, bearing life $L_{10\mathrm{h}} \fallingdotseq 16\,000$ hours.

Example 5 Selecting insert bearing unit

If a bearing is operated under the following conditions, select the flange type unit (UCF) with at least two years (5 000 hours) or longer service life : rotational speed of shaft n is 1 500 min^{-1} ($n = 1\,500$ min^{-1}), and radial load F_r is 5 kN ($F_\mathrm{r} = 5$ kN). The radial load F_r includes the load factor and gear factor.

(1) From the nomogram shown in **Fig. 5.1**, when life time L_h is 5 000 h ($L_\mathrm{h} = 5\,000$ h), life factor f_h can be found as 2.16 ($f_\mathrm{h} \fallingdotseq 2.16$), and speed factor f_n can be found as 0.28 ($f_\mathrm{n} \fallingdotseq 0.28$) when the rotational speed n is 1 500 min^{-1} ($n = 1\,500$ min^{-1}).

$$\text{Dynamic radial load rating } C_\mathrm{r} = F_\mathrm{r} \cdot \frac{f_\mathrm{h}}{f_\mathrm{n}} = 5 \times \frac{2.16}{0.28}$$

$$\fallingdotseq 38.6 \text{ (kN)}$$

(2) Find the flange type unit that meets the following condition : dynamic radial load rating C_r is 38.6 kN ($C_\mathrm{r} = 38.6$ kN). As for the diameter series 2, UCF211J (dynamic radial load rating C_r is 43.4 kN ($C_\mathrm{r} = 43.4$ kN)) can be selected.

Example 6 Selecting pillow block type unit for low speed

If a bearing is used for a dolly under the following conditions, select the pillow block type unit (UCP) with 10 000 hours service life : radial load F_r is 12 kN ($F_r = 12$ kN), and rotational speed is 8 min^{-1}.

(1) Find the required dynamic radial load rating C_r with using **Equations (5.4)** and **(5.5)**.

Speed factor $f_n = (0.03n)^{-1/p} = (0.03 \times 8)^{-1/3} \fallingdotseq 1.61$

Life factor $f_h = \left(\dfrac{L_{10h}}{500}\right)^{1/p} = \left(\dfrac{10\,000}{500}\right)^{1/3} \fallingdotseq 2.71$

$$\text{Dynamic radial load rating } C_r = P_r \cdot \frac{f_h}{f_n} = 12 \times \frac{2.71}{1.61}$$

$$\fallingdotseq 20.2 \text{ (kN)}$$

(2) From **Table 6.6**, define safe factor f_s as 2 ($f_s = 2$), and find the static radial load rating of bearing required C_{0r}.

$$C_{0r} = f_s \cdot P_r = 2 \times 12 = 24 \text{ (kN)}$$

(3) The unit is used for a dolly, and vibration or impact may occur. Thus, select UCP308J ($C_r = 40.7$ kN, $C_{0r} = 24.0$ kN).

Example 7 Calculating bearing life in case of use at high temperature

Find the bearing life if the heat resistant pillow block type unit (UCP215JD1K2) is operated under the following conditions : operating temperature is 175 ºC, radial load F_r is 4 kN ($F_r = 4$ kN), and the rotational speed n is 800 min^{-1} ($n = 800\ \mathrm{min}^{-1}$). Note that the radial load F_r includes load factor and gear factor.

(1) From **Table 5.1**, find the dynamic load rating C_r with in the case that a bearing is used at 175 ºC.

$$C_r = 67.4 \times 0.95 = 64.0 \text{ (kN)}$$

Find the bearing life L_{10h} with using **Equation (5.2)**.

$$L_{10h} = \frac{10^6}{60n} \cdot \left(\frac{C_r}{P_r}\right)^3 = \frac{10^6}{60 \times 800} \times \left(\frac{64.0}{4}\right)^3$$

$$\fallingdotseq 85\,000 \text{ (h)}$$

(2) If a bearing unit is operated at 175 ºC, grease is degraded faster, and it cannot be used without lubrication. Supply grease at intervals specified in **Table 14.4**.

(3) If the shaft is extended excessively, install a bearing unit on the identical shaft on the fixed side (positioning of shaft), and install another bearing unit on the free side (see **"10 Design of shaft and base"**).

Example 8 Calculating grease life

Find the grease life in the case that pillow block type unit UCP204J (bearing UC204) under the following conditions : radial load F_r is 1 kN ($F_r = 1$ kN), and rotational speed n is 800 min^{-1} ($n = 800\ \mathrm{min}^{-1}$). Note that the radial load F_r includes load factor and belt factor. Operating temperature of the bearing should be 40 ºC.

Find the grease life L with using **Equation (5.10)**.

$$\log L = 6.10 - 4.40 \times 10^{-6}\, d_m n - 2.50 \left(\frac{P_r}{C_r} - 0.05\right)$$

$$- (0.021 - 1.80 \times 10^{-8}\, d_m n)\, T$$

$$= 6.10 - 4.40 \times 10^{-6} \times 12.5 \times 10^4$$

$$- 2.50 \left(\frac{1}{12.8} - 0.05\right)$$

$$- (0.021 - 1.80 \times 10^{-8} \times 12.5 \times 10^4) \times 50$$

$$= 4.542$$

$$L \fallingdotseq 34\,800 \text{ (h)}$$

Example 9 Calculating life of bearing unit in case of non-lubrication

Find the life of a bearing unit in the case that it is operated under the conditions shown in **Example 8**, but without lubrication.

(1) Find the rating life of bearing L_{10h} with using **Equation (5.2)**.

$$L_{10h} = \frac{10^6}{60n} \cdot \left(\frac{C_r}{P_r}\right)^3 = \frac{10^6}{60 \times 800} \times \left(\frac{12.8}{1}\right)^3$$

$$\fallingdotseq 43\,700 \text{ (h)}$$

(2) Compare the grease life L shown in **Example 8** to the rating life of bearings L_h. Then, grease life L is shorter than the bearing rating life. Therefore, life of a bearing unit should be the same as the grease life L, 34 800 hours ($L = 34\,800$ hours).

7 Allowable rotational speed

7.1 Allowable rotational speed

The rotational speed of a bearing is normally affected by friction heat generated in the bearing. If the heat exceeds a certain amount, seizure or other failures occur, thus causing rotation to be discontinued.

The allowable rotational speed is the highest speed at which a bearing can continuously operate without generating such critical heat.

Allowable rotational speed of a insert bearing unit depends on the dimensions of the bearing, type of oil seal, and fitting conditions of bearing inner ring and shaft.

Table 7.1 shows the standard allowable rotational speeds of insert bearing units.

Table 7.1 Allowable rotational speed of insert bearing units (standard value)

Unit : min^{-1}

28			910			200	540			1 400		

[Remarks] 1. Allowable rotational speed of the units with covers is 80% of the value shown in the table above.

2. If a bearing unit is used with excessively loose fitting, allowable rotational speed must be corrected by multiplying it by the fitting factor f_c shown in **Table 7.2**.

7.2 Correction of allowable rotational speed by fitting

For easier installation of a insert bearing unit to a shaft, clearance fit is used for a bearing inner ring and shaft, in general. Size of fitting clearance between the bearing inner ring and the shaft is related to the allowable rotational speed of the bearing unit. As the rotational speed is increased, the fitting clearance between the bearing inner ring and the shaft should be decreased.

Table 7.2 shows the fitting factors to correct the allowable rotational speed depending on the types of fitting of the bearing inner ring to the shaft.

As for the bearings with set screws, allowable rotational speed must be corrected by multiplying the allowable rotational speed (standard value) by fitting factor, depending on the tolerance class of the shaft used. For the bearings with adapter, shafts of h8 or h9 tolerance class are recommended, while shafts of h5 or j5 tolerance class are recommended for the bearings with eccentric locking collar.

Table 7.2 Fitting factor of insert bearing unit f_c (recommended)

Type of insert bearing unit	Fitting factor f_c					
	Shaft tolerance class					
	h5, j5	j6	h6	h7	h8	h9
With set screw

With adapter	–	–	–	–	1.0	1.0
With eccentric locking collar	1.0	–	–	–	–	–

8 Operating temperature and bearing specifications

8.1 Operating temperature range

Operating temperature range of a insert bearing unit depends on the type of grease used for the bearing, oil seal rubber material, and the internal clearance of the bearing.

Koyo Insert Bearing Units are available in heat resistant unit (special code : D1K2) and cold resistant unit (special code : D2K2) series, as well as standard types, to allow selection optimal for the operating temperature (see **Table 3.3**).

Even though the bearing unit suitable for temperature is used, grease must be fed in accordance with the specified standards, since grease life greatly depends on temperature.

8.2 Operating temperature and internal clearance of bearing

If the temperature of transmission heat to the shaft is high or hot steam enters the hollow bore of the shaft, difference between the temperatures of the bearing inner and outer rings is increased and the internal clearance of the bearing is decreased, leading to breakage at early stages of the bearing sevice life.

Decrease in the internal clearance of the bearing depending on the difference in the temperatures of the bearing inner ring and the bearing outer ring can be found by **Equation (8.1)**.

Under these conditions, decrease in the internal clearance must be calculated, and the internal clearance of bearing needs to be selected properly.

$$S_{t1} = \alpha \cdot D_e \cdot \varDelta_t \quad \cdots\cdots (8.1)$$

Whereas,

S_{t1} : Decrease in the internal clearance of bearing depending on the difference in the temperatures of the bearing inner ring and the bearing outer ring mm

α : Line expansion factor of bearing steel 12.5×10^{-6}

D_e : Raceway dia. of bearing outer ring mm

Diameter series 2, X ····· $D_e \fallingdotseq 0.92\,D$

Diameter series 3 ·········· $D_e \fallingdotseq 0.9\,D$

D : Nominal bearing outer dia. mm

$\varDelta_t$: Difference in temperatures of bearing inner ring and outer ring ℃

If a insert bearing unit is used at a high temperature, abnormal axial load may be applied to the bearing due to axial extension of the shaft caused by high temperature, leading to breakage at early stages of the bearing service life. This fact must be taken into consideration, as well as the internal clearance of the bearing for use of the bearing at a high temperature.

The shaft of free side unit or the unit needs to be able to be moved axially, as the countermeasure against this problem.

(See **“10 Design of shaft and base”**)

9 Strength of housing

The housing for Koyo Insert Bearing Unit reliably withstands use under standard operating conditions, because of selection of good material and the highly tough design suitable to the load capacity of the bearing. However, if a great or impact loads occurs at a low rotational speed, strength of the bearing must be examined in advance, for the purpose safety is especially required.

Although the form of the housing is designed so that it is applicable to various purposes, destruction strength varies depending on the direction of load. Therefore, mounting direction of the bearing unit must be fully examined, as well as the strength of the housing.

At this time, setting of fixing device to support the housing is required depending on the direction or level of load.

Rigidity of the base and flatness of the mounting surface give influence on the strength of the housing. Note that the load applied to the insert bearing unit is recommended to be basically examined by the calculation result of bearing life even if the strength of the housing is satisfied.

9.1 Strength of cast iron housing

Though gray cast iron has many superior features as machine parts material, it is fragile against impact load. Therefore, prior to use of it, level, direction, and property of load applied to it must be fully examined.

Allowable load of gray cast iron housing can be found by using static destruction strength of the housing, taking safety factor into consideration.

Table 9.1 shows the safety factor of gray cast iron products against load, and **Fig. 9.1** to **Fig. 9.7** show the outline values of static destruction strength of pillow block type, flange type and take-up type housings.

Table 9.1 Safety factor of gray cast iron products (recommended)

Property of load	Safety factor of gray cast iron
Static load	4
With vibration	10
With impact	15

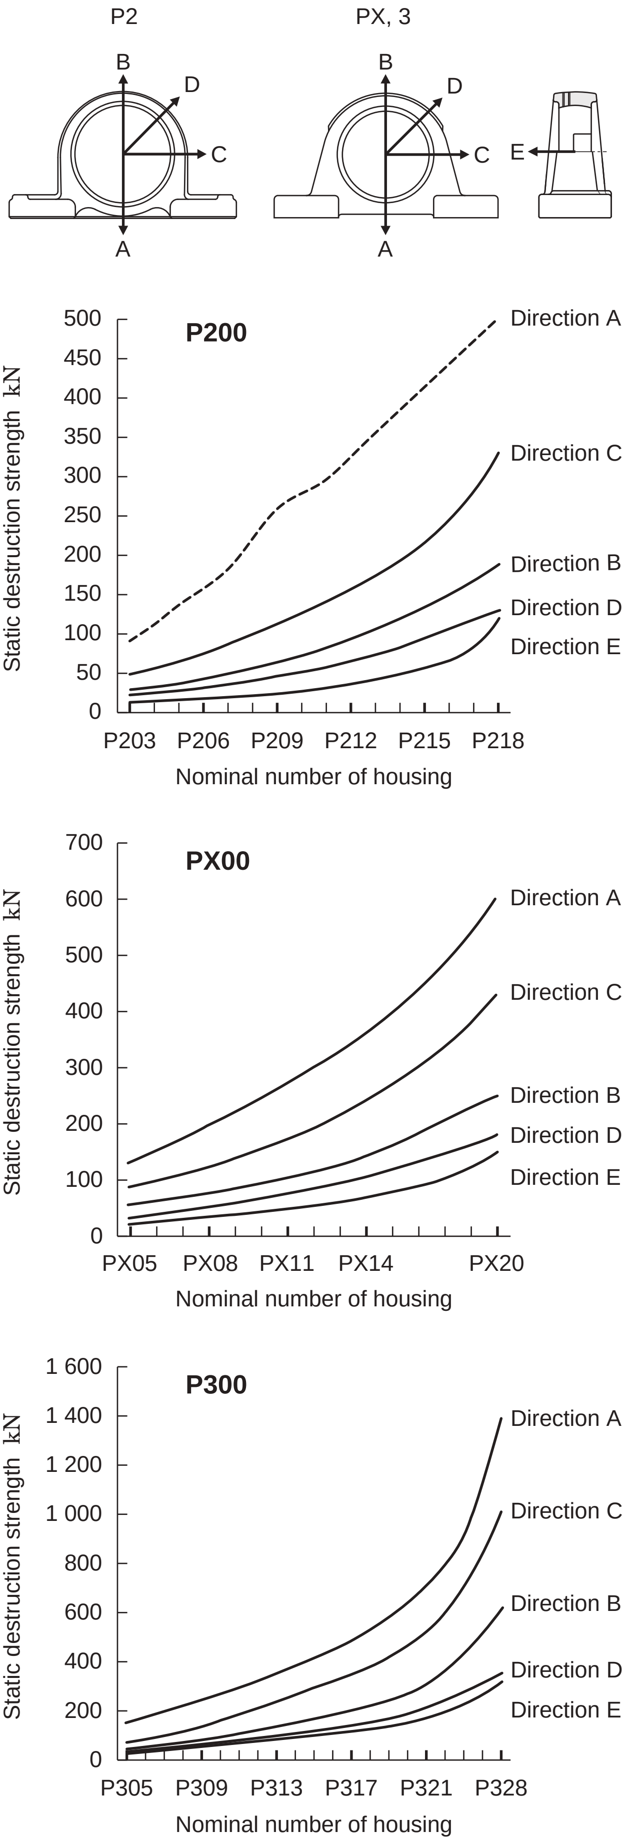

Fig. 9.1 Static destruction strength of pillow block type housing (P)

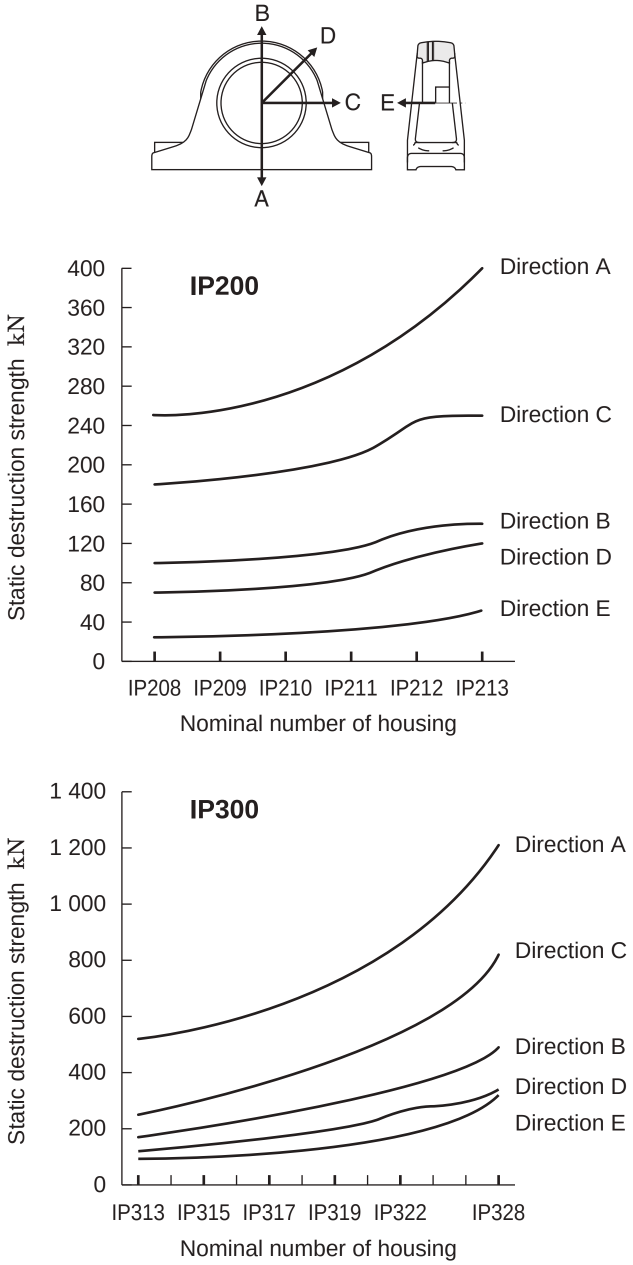

Fig. 9.2 Static destruction strength of thick section pillow block type housing (IP)

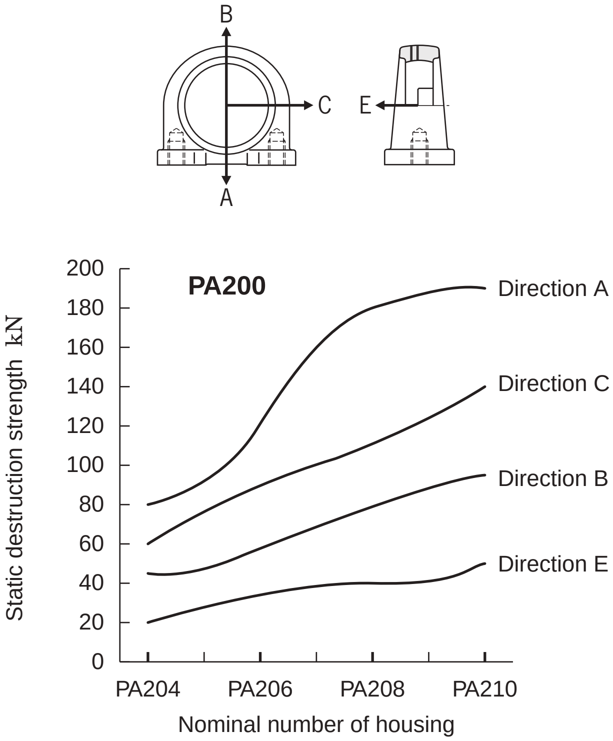

Fig. 9.3 Static destruction strength of tapped-base pillow block type housing (PA)

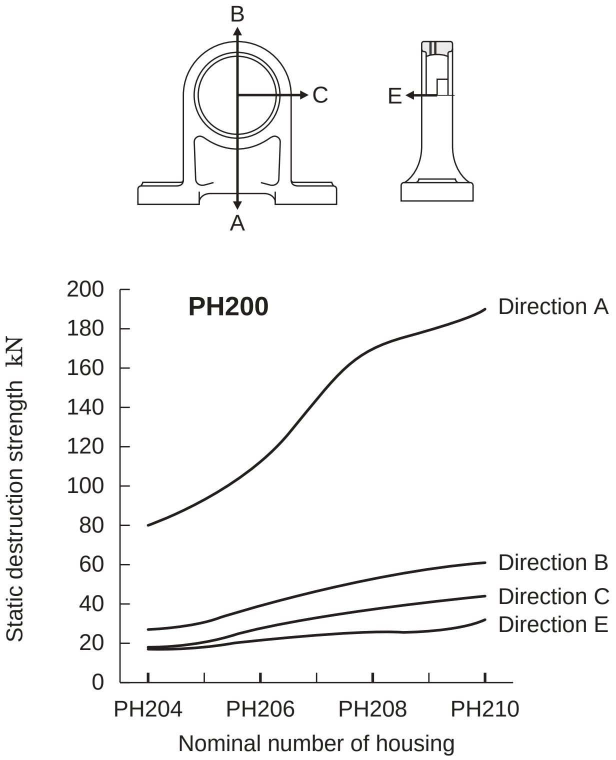

Fig. 9.4 Static destruction strength of higher centerheight pillow block type housing (PH)

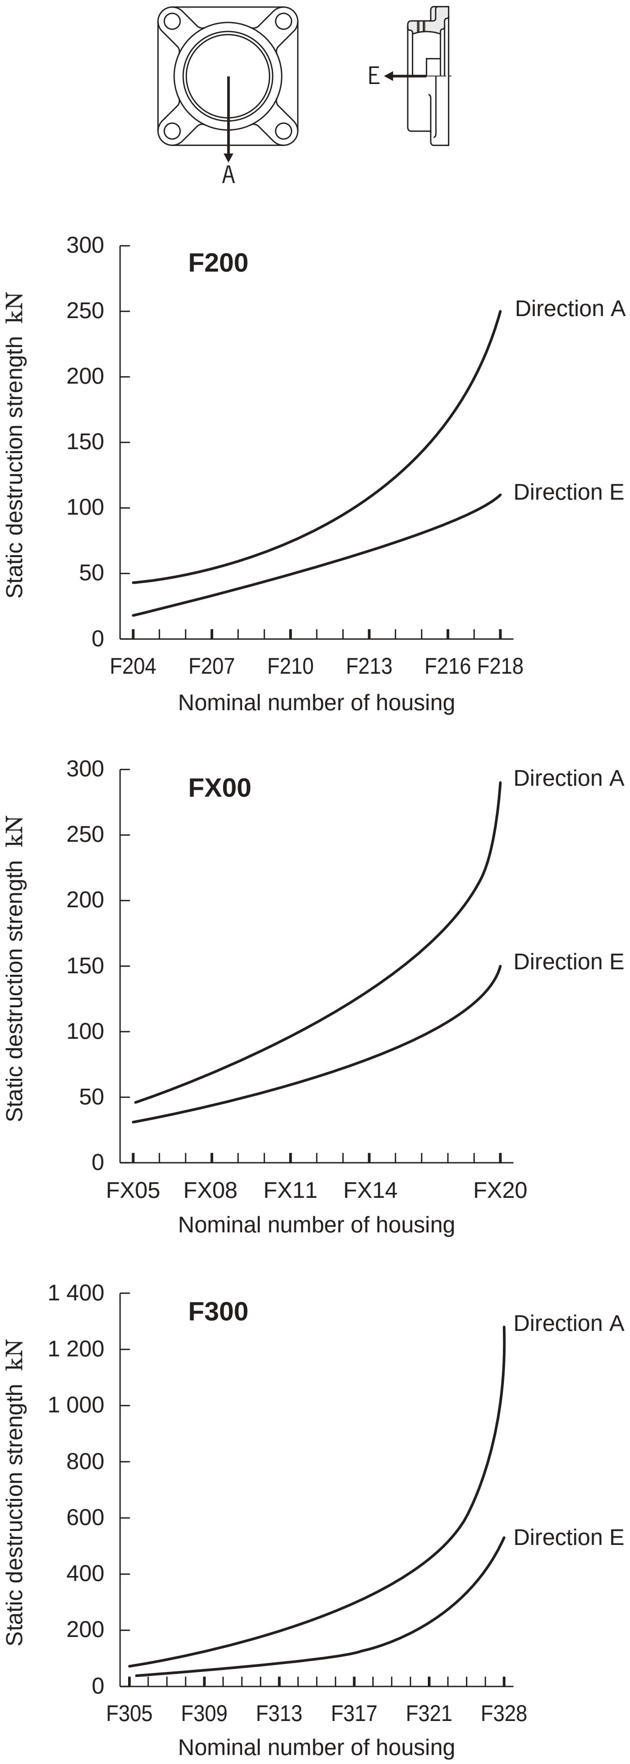

Fig. 9.5 Static destruction strength of square-flanged type housing (F)

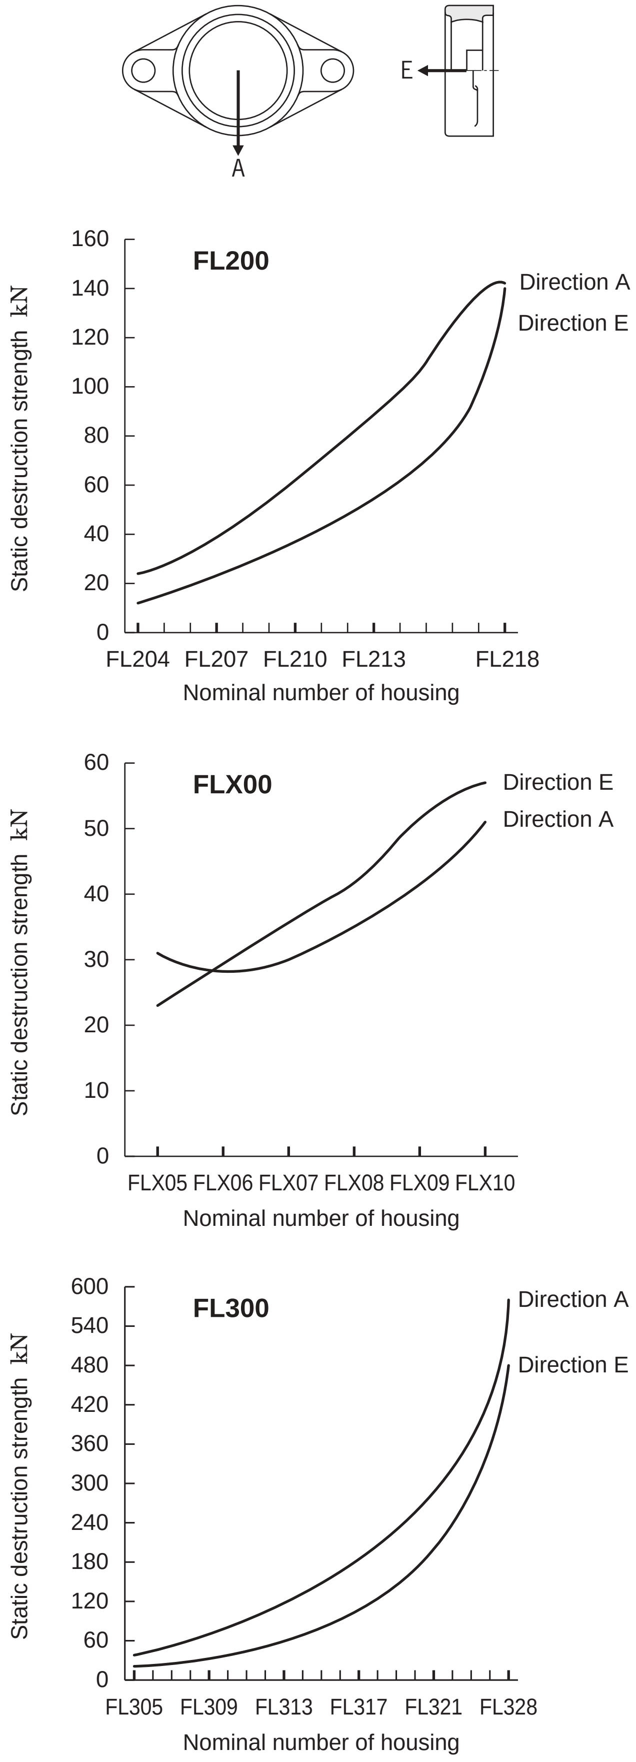

Fig. 9.6 Static destruction strength of rhombic-flanged type housing (FL)

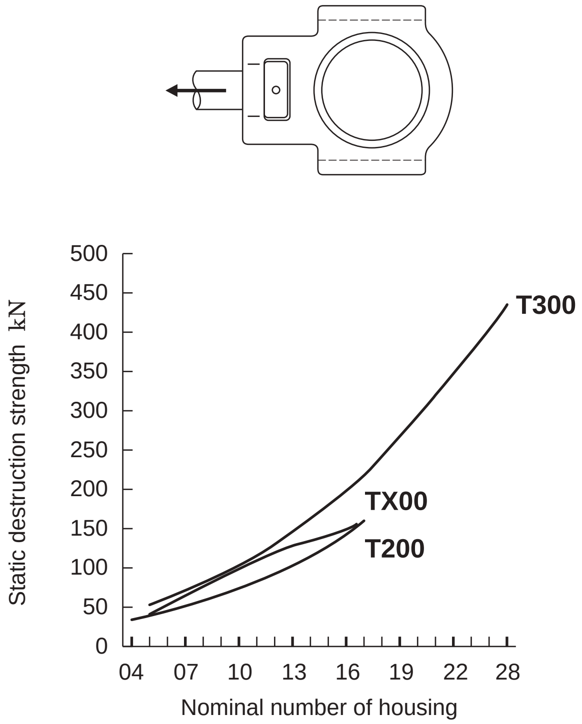

Fig. 9.7 Static destruction strength of take-up type housing (T)

9.2 Strength of steel housing

The precisely pressed steel housing is highly rigid, but great deformation occurs when load is applied until it is broken. Thus, allowable load of the pressed steel housing must be the value deformation of the housing caused by load does not influence on actual use.

Table 9.2 shows the allowable load of the pressed steel housing.

Table 9.2 Allowable load of pressed steel housing (recommended)

Load direction	Allowable load of pressed steel housing
Radial	Approx. 1/6 of basic dynamic radial load rating of bearing (C_r)
Axial	Approx. 1/18 of basic dynamic radial load rating of bearing (C_r)

9.3 Strength of stainless steel housing

To find the allowable load of a stainless steel housing, use the static destruction strength of a housing, taking safety factor into consideration.

Table 9.3 shows the safety factors for stainless steel products. As for the basic values of the static destruction strength of SP200, SPA200, SF200, SFL200, ST200 type housings, apply P200 of **Fig. 9.1**, PA200 of **Fig. 9.3**, F200 of **Fig. 9.5**, FL200 of **Fig. 9.6** and T200 of **Fig. 9.7**. For the basic values of the static destruction strength of the SP000 and SFL000 type housings, see P000 of **Fig. 9.8** and FL000 of **Fig. 9.9** and multiply them by 1.5 respectively.

Table 9.3 Safety factor of stainless steel products

Property of load	Safety factor of stainless steel products
Static load	3
With vibration	5
With impact	10

9.4 Strength of "compact" series housing

The "compact" series housing is made of zinc alloy die-cast, but great deformation occurs when load is applied until it is broken.

Table 9.4 shows safety factor for zinc alloy die-cast, and **Fig. 9.8** and **9.9** show the outline values of the static destruction strength of the zinc alloy die-cast housing.

Table 9.4 Safety factor of zinc alloy die-cast products

Property of load	Safety factor of die-cast products
Static load	8
With vibration	15
With impact	20

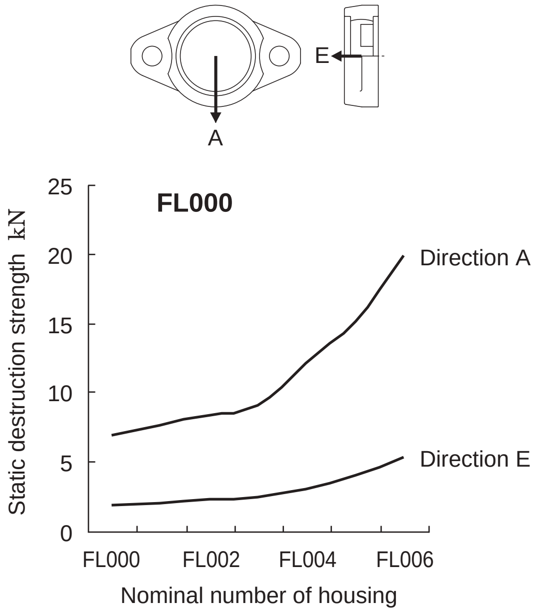

Fig. 9.9 Static destruction strength of "compact" housing (FL)

10 Design of shaft and base

10.1 Design of shaft

For intrinsic performance of a insert bearing unit and maintenance of it for a long time, selection of the shaft optimal for operating conditions is important. Use the shaft with enough rigidity but free from bend, scratch, or burr.

10.1.1 Tolerance of shaft

(1) Tolerance of shaft used for cylindrical bore bearing with set screws

For the cylindrical bore bearing with set screws, use the shaft of the tolerance class leading to relatively loose fitting to simplify the mounting procedures. The fitting clearance between the bearing inner ring and the shaft should be decreased as the rotational speed of the shaft is increased.

Table 10.1 shows the guideline for the tolerance class of the rotational speed of the cylindrical bore bearing with set screws and the shaft used.

If the cylindrical bore bearing with set screws is exposed to heavy load ($P_r / C_r > 0.12$), vibration, or impact, use shaft of the tolerance class leading to relatively tight fitting to prevent creep or fretting to be occurred to the fitting surface of the bearing inner ring and the shaft.

To use tight fitting of the cylindrical bore bearing with set screws, see **Table 10.2** showing the guideline for the tolerance class of the shaft used.

Table 10.3 shows the recommended deviation from circular and cylindrical forms of the shaft used.

Table 10.1 Tolerance of shaft used for cylindrical bore bearing with set screws (recommended) (clearance fitting or transition fitting)

Unit : μm

Shaft diameter (mm)		Tolerance of shaft							
		j6		h6		h7		h8

10	**18**	8
18	**30**	9
30	**50**	11
50	**80**	13
80	**120**	15
120	**180**	18

(2) Tolerance of shaft used for bearing for blower (cylindrical bore with set screws)

In the bearing for blower (special code S5), smaller internal clearance of bearing (C2) and once-class-higher bearing tolerance reduce vibration and noise during high-speed rotation.

Therefore, use of the shaft in the tolerance class shown in **Table 10.4** as the bearing for blower (cylindrical bore with set screws) used is recommended.

Table 10.4 Tolerance of shaft used for bearing for blower (cylindrical bore with set screws) (recommended)

Unit : µm

Shaft diameter (mm)		Tolerance of shaft			
		h5		j5	
over	up to	upper	lower	upper	lower
10	**18**	0	– 8	+5	– 3
18	**30**	0	– 9	+5	– 4
30	**50**	0	–11	+6	– 5
50	**80**	0	–13	+6	– 7
80	**120**	0	–15	+6	– 9
120	**180**	0	–18	+7	–11

(3) Tolerance of shaft used for tapered bore bearing (with adapter)

Since the tapered bore bearing is fixed to a shaft with the adapter, the shaft in the tolerance class allowing relatively loose fitting should be selected, for easier mounting.

Table 10.5 shows the tolerance of shaft used for the tapered bore bearing (with adapter).

Table 10.5 Tolerance of shaft used for tapered bore bearing (with adapter) (recommended)

Unit : µm

Shaft diameter (mm)		Tolerance of shaft			
		h8		h9	
over	up to	upper	lower	upper	lower
18	**30**	0	–33	0	– 52
30	**50**	0	–39	0	– 62
50	**80**	0	–46	0	– 74
80	**120**	0	–54	0	– 87
120	**180**	0	–63	0	–100

(4) Tolerance of shaft used for cylindrical bore bearing with eccentric locking collar

As for the cylindrical bore bearing with eccentric locking collar, if the fitting clearance between the bearing inner ring and the shaft is great, the shaft may be installed with being tilted because of its structure.

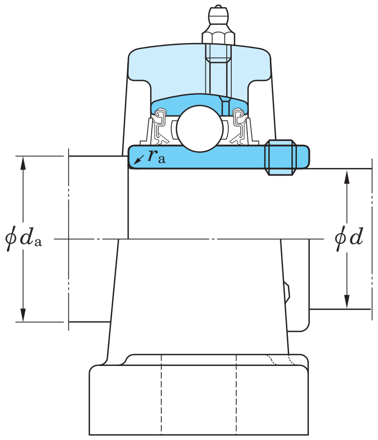
Therefore, for cylindrical bore bearing with eccentric locking collar, use of the shaft in the same tolerance class (h5 or j5) as that used with the bearing for blower (special code S5) is recommended (see **Table 10.4**).

10.1.2 Dimensions of shouldered shaft

When using the cylindrical bore bearing in the environment exposed to a great axial load, excessive vibration, or impact, adopt the shouldered shaft, and tighten the bearing inner ring with the nut.

Table 10.6 shows the shoulder diameter and the fillet radius of the shouldered shaft.

Table 10.6 Shoulder diameter and fillet radius of shouldered shaft (recommended)



Unit : mm

Bore dia. No.	Nominal bearing bore dia. d	UC200, UCX00		UC300

28	**140**			160	3

10.1.3 Countermeasures against heat

In general, two or more insert bearing units are used for a shaft. If installation distance for the insert bearings is small or expansion and contraction of the shaft due to temperature are a little, install each of the bearing unit to the fixed side.

However, if installation distance is great and the shaft is exposed to heat, the shaft to be installed should be positioned with a bearing unit to be on the fixed side, and another bearing unit should be installed with it to be on the free side.

Because, if the shaft is exposed to heat, it is expanded in the axial direction, leading to a great axial load to the bearing, and it causes premature breakage of the bearing. Therefore, expansion of the shaft is absorbed by the bearing unit on the free side.

Equation (10.1) shows the relation of temperature increase to expansion of the shaft.

$$\Delta_\ell = \alpha \cdot \Delta_t \cdot l \quad \cdots\cdots\cdots (10.1)$$

Whereas,

Δ_ℓ : Expansion of shaft mm

α : Linear expansion coefficient of shaft

in the case of standard steel $11 \sim 12 \times 10^{-6}$

Δ_t : Temperature increase ℃

l : Installation distance of unit mm

Countermeasures against great expansion of shaft as a result of exposure to heat are shown below.

(1) Installation with full dog point set screw on the free side

If the shaft is exposed to heat and expanded in axial direction, the bearing unit must be installed so that it or the shaft can freely move in axial direction.

If the rotational speed is relatively slow, provide the shaft with key groove, attach the full dog point set screw (special code G6) to the bearing, and use it as the free side unit. Fit the tip on the dog point of the set screw to the key groove on the shaft to guide the move of the shaft in axial direction.

Fig. 10.1 shows the structure example of bearing unit with key groove on shaft and full dog point set screw and use as free side unit. **Table 10.7** shows the dimensions of key groove for the full dog point set screw.

If a bearing unit is used as the free side bearing unit by adopting this method, h7 is recommended as the tolerance class of the shaft to be used.

If temperature of the shaft is higher than that in the bearing, the shaft in the tolerance class allowing a greater fitting clearance must be used.

If a bearing unit is used as the free side unit by adopting the above method, fretting corrosion may occur to the fitting surface between the bearing inner ring and the shaft. In order to prevent fretting corrosion, application of grease onto the bore surface of the bearing when the bearing unit is installed.

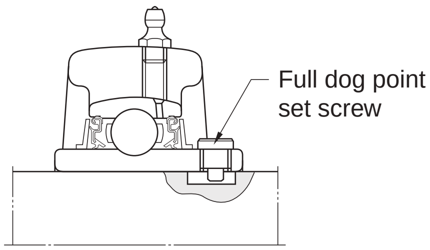

Fig. 10.1 Use on free side with full dog point set screw

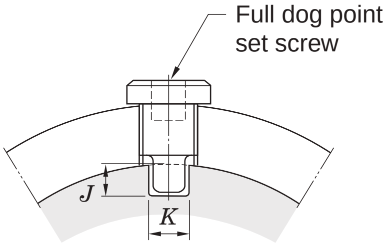

Table 10.7 Dimensions of key groove for full dog point set screw (use on free side)

Nominal size of set screw	Dimensions of key groove (mm)		Applicable nominal bearing number		
	J	K (Min.)	UC200	UCX00	UC300
M6 × 0.75	5	4	201–206	X05	305, 306
M8 × 1	6	6	207–209	X06–X08	307
M10 × 1.25	6.5	7	210–212	X09–X11	308, 309
M12 × 1.5	7	9	213–218	X12–X17	310–314
M14 × 1.5	7	10		X18	315, 316
M16 × 1.5	8	12		X20	317–319
M18 × 1.5	8	13			320–324
M20 × 1.5	8	15			326, 328

Allowable tolerance of key groove dimension “K” (Recommended value : 0~+0.2)

(2) Use of cartridge type unit on free side

In the environment the rotational speed is relatively high or the bearing unit is exposed to vibration, use of the cartridge type unit as the free side unit and move of the bearing unit between the mounting bore on a machine and the outside surface of the housing in axial direction are recommended.

Fig. 10.2 shows the example of structure of the cartridge type unit as the free side unit.

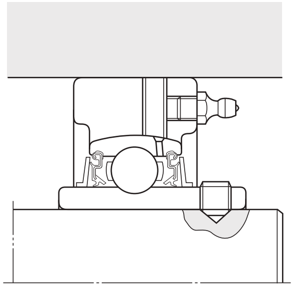

Fig. 10.2 Use of cartridge type unit on free side

If a insert bearing unit is exposed to heat, countermeasures against expansion of the shaft in axial direction as well as calculation of decrease in the internal clearance of the bearing to select the internal clearance of the bearing appropriately (see **"8 Operating temperature and bearing specifications"**).

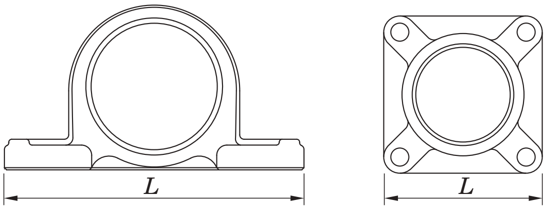
10.2 Design of base

10.2.1 Rigidity of base and flatness of mounting surface

If rigidity of the base that a insert bearing unit is to be installed is low or the flatness of the mounting surface is poor, vibration or abnormal noise may occur to the bearing unit during operation, leading to premature breakage or lower strength of the housing.

Therefore, the base that the insert bearing unit is to be installed must have enough rigidity, and the mounting surface must be finished with accuracy allowing elimination of deformation on the bearing or housing.

Fig. 10.3 shows the recommended values for flatness of the mounting surface of the base that the insert bearing unit is to be installed.



Max. : L / 1 000 mm

Fig. 10.3 Flatness of mounting surface of base (recommended)

10.2.2 Mounting bore of cartridge type unit

The cartridge type unit is directly fit to the cylindrical bore of the base.

Under the standard operating conditions, select H7 as the tolerance class of cylindrical hole on the base that the cartridge type unit is to be installed. For such purposes that the shaft and the bearing inner ring are hot, select G7 as the tolerance class of cylindrical bore on the base.

In the environment the bearing unit is exposed to vibration or impact, selection of the tolerance class allowing smaller fitting clearance between the cylindrical bore of the base and the bearing unit is recommended.

Table 10.8 shows the tolerance of cylindrical bore of the base that the cartridge type unit is to be installed.

Table 10.8 Tolerance of cylindrical bore for mounting cartridge type unit (recommended)

10.2.3 Dimensions relative to installation of take-up type unit

The take-up type unit is incorporated between the two guide rails on the base side, and enables adjustment of the support position with the shaft center by the adjuster bolt.

Table 10.9 shows the dimensions of the guide rail, adjuster bolt, and round nut to install the take-up type unit to the base.

Table 10.9 Dimensions relative to installation of take-up type unit (recommended)

10.3 Machining dimensions of holes for housing dowel pins

The pillow block type, square-flanged type, and rhombic-flanged type housing have the dowel pin seat. If accurate positioning of the housing is required, install it with the dowel pin.

As for the position of the pin for fixing the housing and pin diameter, see the **Supplementary 5** at the end of this catalogue.

11 Tolerances and internal clearance

Tolerances of a insert bearing unit is specified in JIS B 1558 (Rolling bearings - Insert bearings and eccentric locking collars) and JIS B 1559 (Rolling bearings - Cast and pressed housings for insert bearings). JTEKT produces products conforming to these standards.

11.1 Tolerances of bearing

Table 11.1 to **Table 11.4** show the tolerance of a insert bearing for insert bearing unit.

Insert bearings for blower unit (special code S5) are produced with higher accuracy than standard types (see **Table 11.3**).

Table 11.5 shows the permissible values for chamfer dimensions of cylindrical bore bearing inner ring.

Table 11.2 Tolerances and permissible values of outer ring of insert bearing for insert bearing unit

80	**120**	+54	0	+35	0	22
120	**180**	+63	0	+40	0	40

Note 1) To be applied to all the radial planes of tapered bore

[Remarks] 1. Applicable range
Applicable to tapered bore of inner ring of tapered bore radial bearing that standard value of taper ratio is 1/12

2. Amount code

d_1 : Standard diameter at theoretical large end of tapered bore $d_1 = d + \frac{1}{12}B$

Δ_{dmp} : Single plane mean bore diameter deviation at theoretical small end of tapered bore

Δ_{d1mp} : Single plane mean bore diameter deviation at theoretical large end of tapered bore

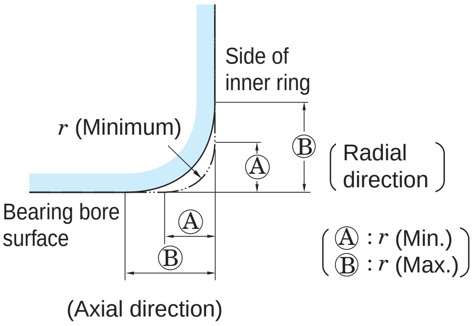
V_{dsp} : Single plane bore diameter variation (a tolerance for the diameter variation given by a maximum value applying in any radial plane of the bore)

B : Nominal inner ring width

α : 1/2 of nominal tapered angle of tapered bore

α = 2º 23' 9.4"
= 2.385 94º
= 0.041 643 rad

Table 11.5 Permissible values for chamfer dimensions of inner ring of bearing with cylindrical bore



Unit : mm

r (Min.)	*r* (Max.)	
	Radial direction	**Axial direction**
0.6	1	2
1	1.5	3
1.1	2	3.5
1.5	2.3	4
2	3	4.5
2.1	4	6.5
2.5	3.8	6
3	5	8
4	6.5	9

[Remark] There shall be no specification for the accuracy of the shape of the chamfer surface, but its outline in the axial plane shall not be situated outside of the imaginary circle arc with a radius of $r_{\min}$ or $r_{1\min}$ which contacts the inner ring side face and bore, or the outer ring side face and outside surface.

11.2 Tolerances of housing

As the tolerance of the housing for a insert bearing unit, tolerance of the diameter of spherical bearing seat fit to the bearing, and tolerance and permissible value of dimensions relative to installation of the housing are specified.

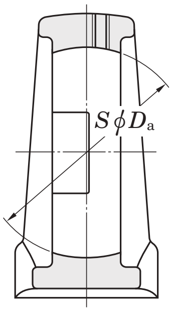
Table 11.6 shows the tolerance of diameter of the spherical bearing seat of housing. Usually, select tolerance class J7 that allows transition fitting of the housing and the bearing.

If priority should be given to operability in installation to a machine, select tolerance class H7 allowing clearance fitting. The unit conforming JIS of tolerance class H7 is equipped with the detent to the outer ring to prevent turning of the outer ring.

If rotating outer ring load occurs or the bearing is rotated while the shaft is stopped, select the tolerance K7 allowing interference fit.

Fig. 11.1 shows the representative example of dimensions relative to installation of the housing with tolerance and permissible value. Respective dimensional tables show the tolerance and permissible values of dimensions relative to installation of the housing.

Table 11.6 Tolerances of spherical bearing seat diameter of housing



Unit : μm

Nominal dia. of spherical bearing seat D_a (mm)		Tolerance class H7		Tolerance class J7		Tolerance class K7	
		Deviation of spherical bearing seat dia. Δ_{Dam}		Deviation of spherical bearing seat dia. Δ_{Dam}		Deviation of spherical bearing seat dia. Δ_{Dam}	
over	up to	upper	lower	upper	lower	upper	lower
18	**30**	+21	0	+12	–9	+6	–15
30	**50**	+25	0	+14	–11	+7	–18
50	**80**	+30	0	+18	–12	+9	–21
80	**120**	+35	0	+22	–13	+10	–25
120	**180**	+40	0	+26	–14	+12	–28
180	**250**	+46	0	+30	–16	+13	–33
250	**315**	+52	0	+36	–16	+16	–36

[Remark] JTEKT generally applies class J to housing designs.
Class H and class K can also be applied depeding on the application.

Fig. 11.1 Dimensions relative to installation of housing with tolerance and permissible value (representative example)

Table 11.7 shows standard tolerance of cut or cast portions not specified in this catalogue.

Table 11.7 Standard tolerance not specified respectively

Item	Standard No.	Class
Cutting	JIS B 0405	Medium
Casting of cast iron	JIS B 0403	Standard
Casting of cast steel	JIS B 0403	Standard

11.3 Bearing internal clearance

Insert bearing internal clearance for insert bearing unit is specified by the move at the time the inner ring or outer ring is moved in the radial direction (radial internal clearance). Value of internal clearance during operation (to be called operation clearance) gives a great influence on rolling fatigue life of the bearing, heat, noise, and vibration.

If the bearing inner ring is installed to the shaft with interference, the internal clearance of bearing must be fixed taking expansion of the bearing inner ring into consideration. If transmission heat to the shaft is high or hot steam runs through the hollow of the shaft, calculate the decrease of internal clearance, and appropriately select the internal clearance of bearing (see **"8 Operating temperature and bearing specifications"**).

Table 11.8 shows the internal clearance applicable to specifications of insert bearing for Koyo Insert Bearing Unit, and **Table 11.9** shows the standard values of bearing internal clearance.

Table 11.8 Internal clearance applicable to types of insert bearing for insert bearing unit

Type	Applicable internal clearance	
	Bearing with cylindrical bore	Bearing with tapered bore
Standard type	CN	C3
Stainless steel type	C3	–
Heat resistant type (special code : D1K2)	C4	C5
Cold resistant type (special code : D2K2)	CN	C3
High speed type (special code : K3)	CN	C3
For blower (special code : S5)	C2	C3

[Remark] For the bearings that the internal clearance in this table is applied, no clearance code is indicated.

Table 11.9 Standard values for internal clearance of insert bearing for insert bearing unit

Unit : μm

80	**100**	1	18	12	36	24	58	30	58	53	84	75	120
100	**120**	2	20	15	41	28	66	36	66	61	97	90	140
120	**140**	2	23	18	48	33	81	41	81	71	114	105	160

[Remarks] 1. Radial internal clearance in this table conforms to JIS B 1558 (Rolling bearings - Insert bearings and eccentric locking collars).

2. Increase in radial internal clearance generated by measured load conforms to the table below. Smaller correction of C2 clearance is applicable to the lower clearance, while larger correction is applicable to the upper clearance.

Unit : μm

Nominal bearing bore dia. *d* (mm)		Measured load	Correction of clearance				
over	up to	N	C2	CN	GN, C3	C4	C5
2.5	**18**	24.5	3 – 4	4	4		
18	**50**	49	4 – 5	5	6		
50	**280**	147	6 – 8	8	9		

12 Materials

12.1 Materials of bearing

Insert bearings for insert bearing unit are made of the following materials : bearing rings (outer and inner rings) and rolling elements (balls) are made of steel, and cages are made of pressed steel.

These bearing materials need the features shown below.

(1) Higher elastic limit is required, since high contact stress occurs partially.
(2) Higher rolling fatigue strength is required, since great contact load occurs repeatedly.
(3) Superior hardness
(4) Superior wear resistance
(5) Superior toughness against impact load
(6) Superior stability of dimensions

As the material of bearing rings (outer and inner rings) and rolling elements (balls) of the insert bearing for Koyo Insert Bearing Unit, high carbon chromium bearing steel specified in JIS is used.

For more reliability of bearing, vacuum degassing is executed against high carbon chromium bearing steel to reduce non-metallic inclusion and included oxygen. After the materials of bearing are made into the specified form, quench-and-temper is executed until its hardness is 60HRC.

Table 12.1 shows the chemical components of high carbon chromium bearing steel. As the material of bearing rings and rolling elements of the insert bearings for stainless-series unit (special code : S6), stainless steel with superior corrosion resistance is used. Cages are made of cold-reduced carbon steel sheets and strips specified in JIS.

Table 12.2 shows the chemical compositions of cold-reduced carbon steel sheets and strips specified in JIS.

12.2 Materials of housing

A housing for insert bearing unit is mainly made of gray iron casting products, carbon steel casting products, structural steel, cold-reduced carbon steel sheets and strips.

Gray iron casting is the most popular as the material of housing for insert bearing unit, featuring absorption of vibration, damping superior to other materials, easy and varied forming by casting, appropriate strength, and excellent heat property.

Table 12.3 shows the mechanical properties of gray iron casting.

If superior strength is required for the housing for insert bearing unit, select carbon steel casting products with higher rupture strength, carbon steel casting, or general structural rolled steel with higher strength against impact.

For the material of housings of the “compact” series unit, zinc alloy die-cast is used, and corrosion-resistant cast steel products are used for housings of the stainless series unit. Cold-reduced carbon steel sheets and strips are used as the material of housings for the pressed steel unit.

Table 12.4 to **12.8** show the mechanical properties of these housing materials.

Spheroidal graphite iron casting (FCD450-10 of JIS G 5502) may be used, as well as these materials.

Table 12.1 Chemical compositions of high carbon chromium bearing steel (JIS G 4805)

Code	Chemical components (%)

Washer for bearing	Cold-reduced carbon steel sheets and strips	SPCC	JIS G 3141
Eccentric locking collar	Mechanical structural carbon steel	S17C	JIS G 4051
Grease nipple	Free-cutting steel	SUM24L	JIS G 4804

13 Performance

13.1 Friction torque of bearing

Friction torque of a insert bearing for insert bearing unit is the synthesis of rolling friction between the rolling elements (balls) and the bearing rings (outer and inner rings), sliding friction between the rolling elements and the cages, agitating resistance of lubricants, and friction resistance of oil seal.

Greatness of friction torque is influenced by the type, dimensions, load, and rotational speed of bearing, and lubricating conditions.

For the insert bearing unit, oil seals with especially superior dustproof performance are adopted to improve sealing performance of the bearing. Thus, friction resistance of the oil seal greatly depends on the friction torque of the bearing.

Friction torque of the insert bearing for insert bearing unit can be found by the Equations below.

$$M = M_{\mathrm{p}} + M_{\mathrm{k}} \quad \cdots\cdots \quad (13.1)$$

$$M_{\mathrm{p}} = \mu \cdot P \cdot \frac{d}{2} \quad \cdots\cdots \quad (13.2)$$

Whereas,

M : Friction torque of bearing mN · m

M_{p} : Friction torque of sections changed by load mN · m

M_{k} : Friction torque of sections changed by rotational speed mN · m

μ : Friction coefficient (0.001 5 to 0.002)

P : Load applied to bearing N

d : Nominal bearing bore dia. mm

Note that the agitating resistance of lubricants and the friction resistance of oil seal are difficult to be calculated, since they are fluctuated by rotational speed.

Fig. 13.1 shows the result of measurement of friction torque of the typical insert bearing unit.

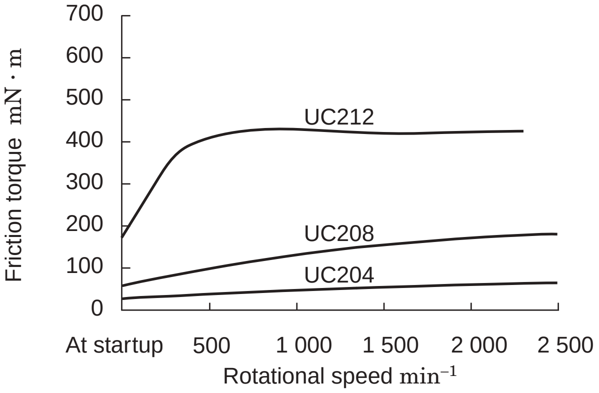

Fig. 13.1 Example of measurement result of insert bearing unit

13.2 Increase in temperature of bearing

Increase in temperature of the insert bearing for insert bearing unit is indicated as heat energy converted from the friction torque in the bearing during operation. Temperature of the bearing during operation increases in proportion to the greatness of friction torque and rotational speed (friction torque increases in proportion to the greatness of load).

Increase in temperature of the insert bearing for insert bearing unit depends on the heating value generated by friction in the bearing and that discharged outside from the surface of the bearing and housing. Therefore, increase in temperature of the insert bearing for insert bearing unit is influenced by the environmental conditions of the location that the insert bearing unit is installed (quality of heat radiation environment).

Temperature of the insert bearing unit is increased gradually after the startup of operation, and reaches the maximum level after one or two hours, if no abnormality occurs. Then, it is decreased a little, and enters the steady-state (see **Fig. 13.2**).

In this manner, if the operating conditions are not changed, bearing temperature is virtually constant, and therefore, measurement of temperature and assumption of the status of bearing are enabled.

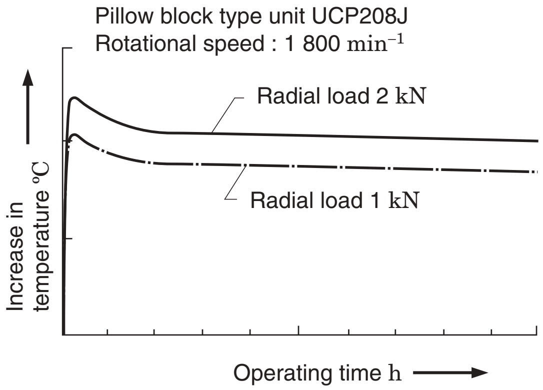

Fig. 13.2 Example of temperature measurement during operation of pillow block type unit

Increase in temperature during operation of the insert bearing unit depends on the type of oil seal used for the bearing as well as friction torque.

Increase in temperature of the triple-lip seal type (supplementary code L3) is greater than the standard type, and that of the non-contact seal type (special code K3, S5) is smaller than the standard type.

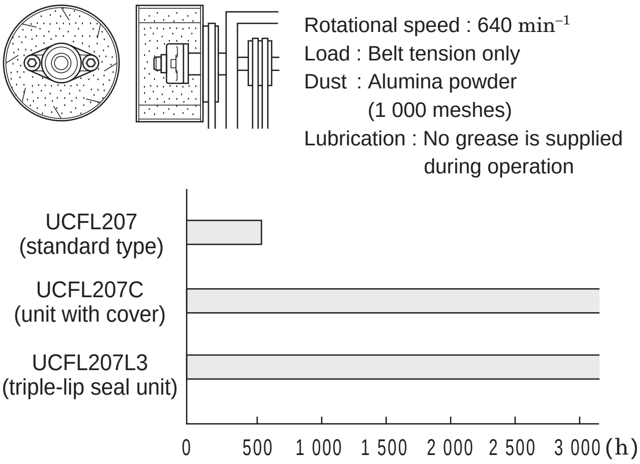
The bearing units for high speed and blower are equipped with the non-contact type oil seals for high speed use and reduction of heat, vibration, and noise.

13.3 Dustproof and waterproof performance

JTEKT executes various tests to check dustproof and waterproof performance of the insert bearing unit. Representative test results are shown below.

13.3.1 Dust sprinkle rotating test (dust preventive performance)

Use the drum type dust sprinkle rotating test machine for this test. Directly sprinkle dusts onto the insert bearing unit while it is being operated, and then, judge the dust preventive performance of the product.



Rotational speed : 640 min^{-1}
Load : Belt tension only
Dust : Alumina powder
(1 000 meshes)
Lubrication : No grease is supplied during operation

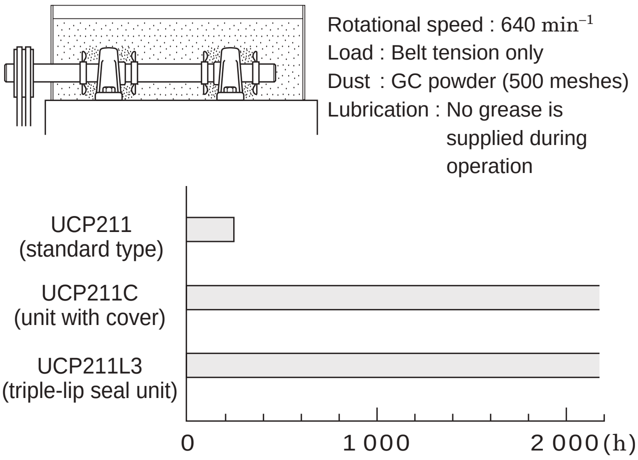
Fig. 13.3 Example of result of dust sprinkle rotating test (dust preventive performance)

In the case of the standard type, abnormal noise occurred about 500 hours after operation was started, and ingress of dusts was recognized.

On the other hand, no abnormality was found in the triple-lip seal type (supplementary code L3) and the covered type (supplementary code C) even after about 3 000 hours after operation was started, and superior dust proof performance was recognized.

13.3.2 Dust bury rotating test (dust preventive performance)

Bury the insert bearing unit into dusts, and run it with the impeller installed to the shaft while stirring dusts, and judge the dust preventive performance of the product. This test is executed under the severest conditions among the operating conditions of the insert bearing unit.



Rotational speed : 640 min^{-1}
Load : Belt tension only
Dust : GC powder (500 meshes)
Lubrication : No grease is supplied during operation

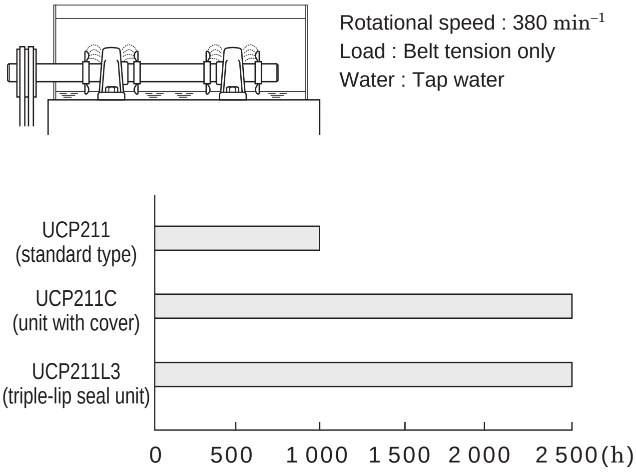
Fig. 13.4 Example of result of dust bury rotating test (dust preventive performance)

In the case of the standard type, abnormal noise occurred about 200 hours after operation was started, and ingress of dusts was recognized.

On the other hand, no abnormality was found in the triple-lip seal type (supplementary code L3) and the covered type (supplementary code C) even after about 2 000 hours after operation was started, and superior dust preventive performance was recognized.

13.3.3 Waterproof performance test

In this test, water is splashed directly impellers installed on the shaft.



Rotational speed : 380 min^{-1}
Load : Belt tension only
Water : Tap water

Fig. 13.5 Example result of waterproof performance test

In the case of the standard type, rust was found on the balls and raceway surface (outer and inner rings) about 1 000 hours after operation was started.

On the other hand, rust of equal level to the standard type was found in the triple-lip seal type (supplementary code L3) and the covered type (supplementary code C) after about 2 500 hours after operation was started.

14 Handling

The most significant feature of the insert bearing unit is simplicity of handling and installation. However, if handling or installation is wrong, premature breakage may occur to the insert bearing unit.

Therefore, handle and install it appropriately for genuine performance of the insert bearing unit.

14.1 Installation

14.1.1 Installation of unit with set screws

When installing the unit to the shaft with the set screws, it is enough to tighten the two set screws of the bearing inner ring with the specified torque.

However, if the environment is exposed to impact or vibration, the shaft is rotated in normal and reverse directions, or the machine is started and stopped frequently and repeatedly, grind the surface of the shaft where the set screw contacts with a file so that the flat seat (**Fig. 14.1**) or drilled seat (**Fig. 14.2**) is provided. It improves the tightening effect of the set screw substantially.

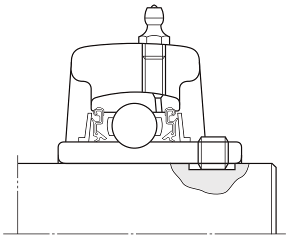


Fig. 14.1 Flat seat provided for shaft
(for improvement in set screw tightening effect)

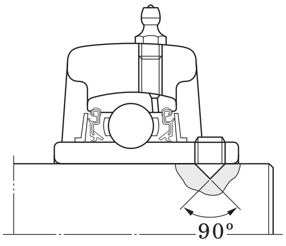

Fig. 14.2 Drilled seat provided for shaft
(for improvement in set screw tightening effect)

If the environment is exposed to a great axial load or excessive vibration, use the shouldered shaft, and tighten the bearing inner ring with the nut (**Fig. 14.3**).

As for the dimensions of the shouldered shaft, see **"10 Design of shaft and base"**.

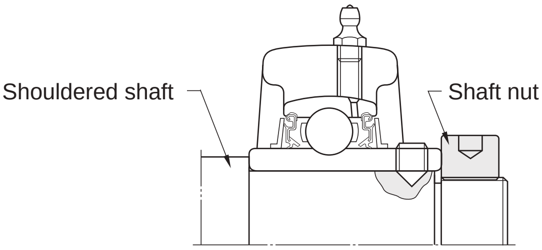

Fig. 14.3 Example of installation with using shouldered shaft and nut

The standard Koyo Insert Bearing Unit is equipped with the Bullet Point set screw featuring secure tightening to shaft. Other set screws are also available depending on your purposes and operating conditions (see **Table 14.1**).

Table 14.1 Set screw of insert bearing for unit

Designations (code)	Details
Bullet Point (no indication) 	The tip of the Bullet Point set screw has a ball shape, and it is designed to firmly grip the shaft by expanding its threads outward against the threads of the inner ring of the bearing as it is tightened. When shock or vibration are problems, the Bullet Point set screw can remain affixed to the shaft longer than other set screws styles including double point, ball point, or others.
Pointed (**G4**) 	The cone point set screw has a 90º angle and fits a drilled cone seat in the shaft. It allows correct positioning on the shaft and prevents shaft movement in an axial direction.
Full dog point cap (**G6**) 	The full dog point set screw fits into the key groove in the shaft and allows for expansion and contraction of the shaft.

Procedures for installation of the insert bearing unit with set screw are shown below.

(1) Inspect the unit to ensure that the rigidity of the base, flatness of the mounting surface, variation of tolerance of the shaft meet the standards. Check for bend, flaw, or birr on the shaft.

(2) Make sure that the tip of the set screw does not exceed the bearing bore diameter surface.

(3) Fit the bearing unit to the shaft, and place it to the specified position. To fit it to the shaft with tight fitting, press-fit the bearing unit to the shaft with a press, cold-fit by cooling the shaft, or shrink-fit the bearing unit by warming it with air bath (100 ℃ or less).

Avoid hitting the side of the bearing inner ring with a hammer to press-fit the bearing to the shaft.

(4) Place the bearing unit to the specified position on the base, and fix it with bolts (**Fig. 14.4**).

Tighten the mounting bolt of the housing with the specified torque by a torque wrench. As for the tightening torque of the mounting bolt, see the **Supplementary table 2** at the end of this catalogue.

Fig. 14.4 Fixing insert bearing unit to base

(5) Tighten the set screws (two) of a bearing inner ring with the specified tightening torque evenly (**Fig. 14.5**).
As for the tightening torque of the set screw, see the **Supplementary table 3** at the end of this catalogue.

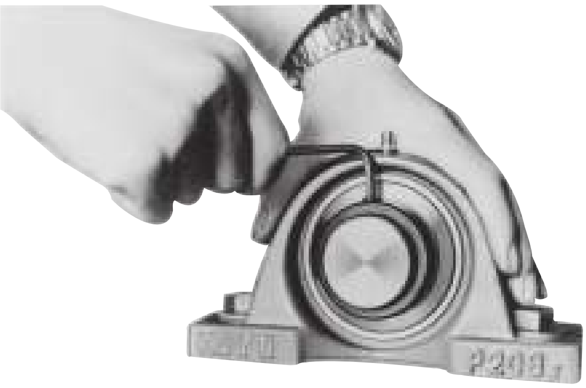

Fig. 14.5 Tightening of set screw

(6) Turn the shaft with your hands, and tighten the set screws (two) of another bearing inner ring with the specified torque.
(7) At last, turn the shaft with your hands, and check for abnormality in turning status of the bearing.

14.1.2 Installation of unit with adapter

To install the bearing with tapered bore to the shaft, set the adapter assembly (sleeve, locknut and washer) between the bearing bore diameter and the shaft. The bearing can be securely fixed even in the environment exposed to excessive vibration or impact.

If tightening of the locknut is loose, fitting to the shaft may be loosened during operation, and slippage occurs to the fitting surface, leading to wear on the shaft or parts. On the contrary, if tightening of the locknut is excessive, the bearing inner ring is expanded, and internal clearance of the bearing is too small, causing abnormal heat or premature breakage. Therefore, pay close attention to installation of the bearing with adapter.

Procedures for installation of the insert bearing unit with adapter assembly are shown below.

(1) Inspect the unit to ensure that the rigidity of the base, flatness of the installing surface, and variation of tolerance of the shaft meet the standards. Check for bend, flaw, or birr on the shaft.
(2) Fit the adapter sleeve to the shaft, and move the adapter sleeve to the installing position of the bearing unit.
If the fitting is too tight to insert the adapter sleeve, put a screwdriver into the cutout of the adapter sleeve, and expand the cutout for easier fitting.
(3) Fit the bearing unit to the shaft.
Then, place the cylindrical backing plate to the whole side of the bearing inner ring that the locknut is to be attached, and tap all around the large diameter side end face to fit the bore diameter surface of the bearing inner ring to the tapered surface of the adapter sleeve closely (**Fig. 14.6**).

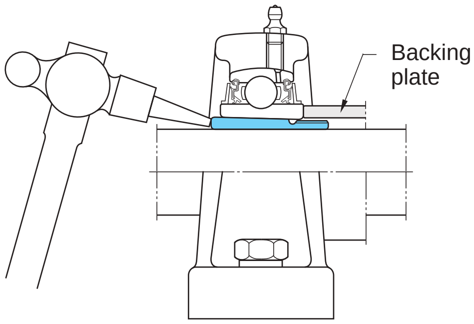

Fig. 14.6 Fitting adapter sleeve to bearing with tapered bore

(4) Fit the washer and locknut to the adapter sleeve, and tighten the locknut with your hands.
(5) Place the bearing unit to the specified position of the base, and fix it with the bolts.
Tighten the mounting bolt of the housing with the specified torque by a torque wrench.
As for the tightening torque of the set screw, see the **Supplementary table 2** at the end of this catalogue.
(6) Tighten the locknut of the adapter.
When tightening the locknut, tighten it with a wrench for tightening, or place a jig onto the cutout of the locknut outer surface, and tap the jig with a hammer and turn the locknut by 1/4 to 1/3 turn (**Fig. 14.7**).
As for the tightening torque of the locknut, see the **Supplementary table 4** at the end of this catalogue.

Fig. 14.7 Tightening locknut

(7A) For the pillow block type unit, loosen the mounting bolts on a housing, adjust the position of the bearing unit in the axial direction while turning the shaft by your hands, and then, tighten the mounting bolt on the housing with the specified torque again.

(7B) For the flange type unit, positions of the bearing and housing in the axial direction must be fit completely. Therefore, pay close attention and tighten the locknut to prevent any error of the position of bearing inner ring.

(8) Bend the outer tab on a washer that fits to the position of cutout on the outer surface of the locknut, and lock the locknut (**Fig. 14.8**).

Fig. 14.8 Bending outer tab of washer (Locking locknut)

(9) At last, turn the shaft with your hands, and check for abnormality in the rotating status of the bearing.

14.1.3 Installing unit with eccentric locking collar

When installing the bearing to the shaft with the eccentric ring, fit the eccentric section of the end outside surface of the bearing inner ring to the eccentric recessed section provided on the eccentric locking collar, turn the eccentric locking collar, and tighten the set screw of the eccentric locking collar to fix the bearing to the shaft.

Since the rotating force of the shaft increases the tightening force of the eccentric ring to the shaft, the unit with eccentric locking collar allows secure fixing of the bearing (**Fig. 14.9**).

Fig. 14.9 Insert bearing unit with eccentric locking collar

Procedures for installation of the insert bearing unit with eccentric locking collar are shown below.

(1) Inspect the unit to ensure that the rigidity of the base, flatness of the mounting surface, and variation of tolerance of the shaft meet the standards. Check for bend, flaw, or birr on the shaft.

(2) Fit the bearing unit to the shaft, and place it on the specified position.

(3) Install the bearing unit to the specified position of the base, and fix it with the bolts.

Tighten the mounting bolts for the housing with the specified torque with a torque wrench.

For the tightening torque of the mounting bolt, see the **Supplementary table 2** at the end of this catalogue.

(4) Fit the eccentric section of the bearing inner ring to the eccentric recessed section provided on the eccentric locking collar, turn the eccentric locking collar in the shaft turning direction, and tighten the set screw of the eccentric locking collar with the specified torque (**Fig. 14.10**).

For the tightening torque of the set screw, see the **Supplementary table 3** at the end of this catalogue.

Fig. 14.10 Installing eccentric locking collar

(5) Turn the shaft with your hands. Then, fix the eccentric locking collar of another bearing unit to the bearing inner ring, and tighten the set screw of the eccentric locking collar with the specified torque.
(6) At last, turn the shaft with your hands, and check for abnormality in the rotating status of the bearing.

14.1.4 Installing unit with cover

Covers for insert bearing unit are available in four types, pressed steel, cast iron, stainless and rubber coated. Install both the covers at last after installation of the bearing and housing is complete.

Procedures for installation of the insert bearing unit with cover are shown below.

(1) Apply grease all around the seal lip of the cover, and pack the internal space of the cover with grease (approximately 1/3 to 1/2 of the space capacity) (**Fig. 14.11**).

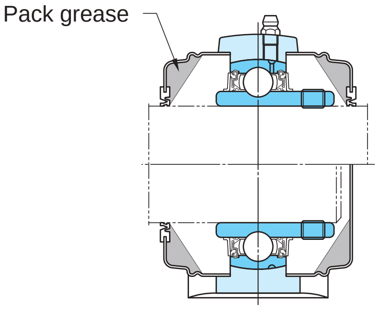

Fig. 14.11 Packing grease in internal space and seal lip of cover

(2) Put a cover through the shaft, and then, fit the bearing unit to the shaft.
(3) Fit the cover through the shaft to the cover groove on the housing, and fix it.
(4A) For the pressed steel cover, tap all around the cover evenly with a synthetic resin hammer to prevent deformation, and install it to the housing (**Fig. 14.12**).
To remove the pressed steel cover, put a screwdriver into the groove on the periphery of the cover, and slightly pry it.

Fig. 14.12 Installing steel plate cover

(4B) When installing the cast iron cover, fit the cover to the cover groove of the housing, and fix it with the bolt.
For the tightening torque of the cast iron cover mounting bolt, see the **Supplementary table 2** at the end of this catalogue.
(5) Install another cover to the housing in a similar manner.
(6) Check for abnormality of the installed cover.
(7) At last, turn the shaft with your hands, and check for abnormality in the rotating status of the bearing.

14.2 Test run inspection

After installation of the insert bearing unit is complete, execute the test run inspection to ensure that it is done appropriately.

The test run inspection should be executed by following the procedures below. Check for abnormality in the bearing unit.

(1) Turn the shaft with your hands, and make sure that the bearing is rotated smoothly.
If any jam, vibration, great rotation torque (heavy), or uneven rotation is found, the bearing is judged to be faulty.
(2) Execute power run with no load and at a low speed, and check for abnormal noise and vibration.
(3) Carry out power run under the specified conditions, and check for abnormal noise, vibration, and temperature increase.

Table 14.2 shows the main faults that may occur during the test run inspection of the insert bearing unit and causes.

Table 14.2 Main faults occurred during test run inspection and their causes

Faults	Causes
Excessively great torque, uneven rotating torque	(1) Faulty installation, leading to preload onto bearing in axial direction (2) Inappropriate handling or installation, leading to interference of oil seal with flinger (slinger) (3) Excessive tightening of locknut (adapter), leading to too small internal clearance of bearing
Abnormal noise, abnormal vibration	(1) Insufficient tightening of set screw of bearing inner ring or mounting bolt of housing (2) Excessively large internal clearance of bearing (3) Bend on shaft, deviation of shaft center of shouldered shaft (4) Faulty accuracy of shaft (5) Insufficient rigidity or faulty flatness of base
Abnormal temperature increase	(1) Excessively small internal clearance of bearing (2) Inappropriate installation, leading to preload onto bearing in axial direction (3) Great load applied (4) Allowable rotational speed is exceeded (5) Faulty flatness of base (6) Inappropriate handling or installation, leading to interference of oil seal with flinger (slinger)

14.3 Periodic inspection

Koyo Insert Bearing Units do not need to be inspected, as well as standard sealed bearings. However, for especially important purposes, periodic inspection must be executed with appropriate intervals for safe operation of the bearing unit.

Since a insert bearing unit cannot be disassembled for inspection of internal status, check the appearance and operating status as shown below, and ensure that the bearing unit is free from fault or not.

(1) Appearance
(2) Looseness of set screw of bearing inner ring or mounting bolt of housing
(3) Vibration, noise
(4) Temperature
(5) Grease supply interval, check of supplied amount

Table 14.3 shows the main faults found during the periodic inspection of insert bearing unit and their causes.

If any fault is found in the insert bearing unit during the periodic inspection, immediately provide countermeasures against them, and carry out them. If the unit is judged to be difficult to be used, replace the bearing unit. It is important to replace the bearing unit to prevent expanding damage to other parts.

Table 14.3 Main faults found during periodic inspection and their causes

Faults	Causes
Excessively great torque (heavy)	(1) Degraded grease (2) Interference of oil seal with flinger (slinger) due to excessive supply of grease (3) Deformation of flinger (slinger), leading to interference with oil seal (4) Abnormal load due to expansion of shaft
Abnormal noise, abnormal vibration	(1) Insufficient tightening of set screw of bearing inner ring or mounting bolt of housing (2) Wear on fitting surface of shaft and bearing inner ring due to creep or fretting (3) Ingress of foreign matters into bearing (4) Damage to raceway surface or rolling contact surface of rolling element by rolling fatigue (5) Dent on raceway surface or rolling contact surface of rolling element by excessive load (6) Excessive warp or bend of shaft
Abnormal temperature increase	(1) Degraded grease (2) Interference of oil seal with flinger (slinger) due to excessive supply of grease (3) Deformation of flinger (slinger), leading to interference with oil seal (4) Looseness of set screw or locknut (adapter) of bearing inner ring (5) Abnormal load due to expansion of shaft (6) Damage to raceway surface or rolling contact surface of rolling element by rolling fatigue

14.4 Supply of grease

In Koyo Insert Bearing Unit, grease of good quality is packed with high quality oil seal. Therefore, grease life is long under standard operating conditions, and use without lubrication is enabled.

If the operating temperature is high or the unit is used in the environment exposed to dusts or high humidity, grease may be degraded faster, leading to faulty lubrication in a short period.

Since Koyo Insert Bearing Units are lubricated type bearings, fresh grease must be periodically supplied to the bearings, if they are used for such purposes that premature degradation of grease is expected.

The insert bearing units can maintain normal lubricated status and longer service life by supplying fresh grease.

14.4.1 Grease life and supply intervals

Grease life of a packed grease insert bearing, like a insert bearing unit, can be found by **Equation (5.10)** in page 37. It is recommended to supply grease with the intervals of 1/4 to 1/3 of grease life found by the calculation shown above to insert bearing units, taking peculiarity of lubricating method and safety of bearing unit into consideration.

If the bearing unit is used under severe environmental conditions, including much dust and high humidity, the greasing intervals must be further shortened, taking these influences into consideration.

If operating conditions of the insert bearing unit are not clear or the unit is operated under standard conditions, consider the greasing intervals shown in **Table 14.4** as the guideline.

14.4.2 Greasing amount

Initial greasing amount of Koyo Insert Bearing Unit is approximately 30 to 35% of the internal space capacity of the bearing. If amount of grease supplied in the bearing is excessive, agitating resistance of grease increases, leading to abnormal heat or grease leak. DO NOT exceed the initial greasing amount.

Table 14.5 shows the recommended values of greasing amount of Koyo Insert Bearing Unit.

If the unit is used at a low speed, supply grease of double amount of that shown in **Table 14.5** is recommended to increase dust preventive performance.

[Remarks] 1. For greasing amount of the UK type bearing, use this table, too.
2. For greasing amount of the triple-lip seal type, 1.5 times of the values shown in this table are recommended.
3. Values shown in this table are applicable to standard grease (specific gravity : 0.9 g/ml). If you use greases of other specific gravity, adopt values converted with the same volume.

Table 14.5 Greasing amount of insert bearing unit (recommended)

Bore dia. code	Greasing amount, g		
	Diameter Series$^{1)}$		
	UC200	UCX00	UC300
01	0.7		
02	0.7		
03	0.7		
04	0.7		
05	0.8	1.3	1.8
06	1.3	1.8	2.5
07	1.8	2.3	3.4

20	–	29	61
21	–	–	69
22	–	–	84
24	–	–	98
26	–	–	126
28	–	–	151

Table 14.4 Greasing intervals of insert bearing unit (recommended)

Operating temperature, ºC		Grease Intervals			Bearing used	Grease supplied
over	up to	Substantially clean	Much dust	Much dust and muddy water		
	50	(3 months) not necessary	(2 months) 1 year	(1 month) 4 months	(Low temperature D2K2)$^{1)}$ Standard bearing	(Lithium) Lithium
50	**70**	1 year	4 months	1 month		
70	**100**	6 months	2 months	2 weeks		
100	**120**	2 months	2 weeks	5 days	High temperature D1K2	Lithium
120	**150**	2 weeks	5 days	2 days		
150	**180**	1 week	2 days	1 day		

Note 1) Greasing intervals in parentheses are applicable to the cold resistant type (D2K2).

[Remark] Greasing intervals shown in this table are applicable to the unit to be operated for 8 to 10 hours a day. If operating hour is out of this range, find the greasing interval proportionally by this table.

14.4.3 Types of grease supplied

Though various types of greases used for insert bearing units are available, if dissimilar grease, especially grease of which soap base is different, is mixed, lubricating performance may be significantly degraded.

Therefore, the same grease to be supplied as the initially packed grease must be used, and avoid use of dissimilar grease.

It is recommended to supply the same grease to Koyo Insert Bearing Unit as the initially packed grease (see **Table 3.3**). If you have no choice but to use other greases, you have to use grease of the same type (thickener) as the initially packed grease, if not the worst.

14.4.4 Supplying grease

When supplying grease to a insert bearing unit, use the grease nipple and grease gun installed to the housing (**Fig. 14.13**).

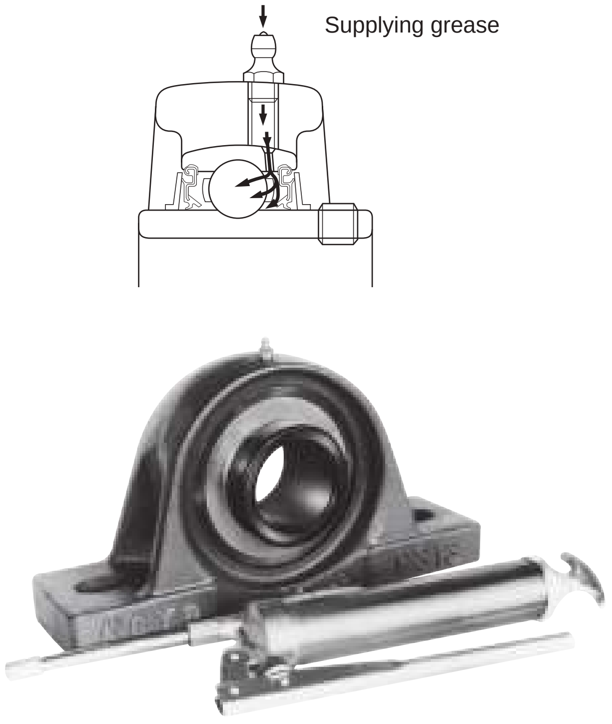

Fig. 14.13 Supplying grease to insert bearing unit

(1) Clean the grease nipple and area around it to prevent ingress of foreign matters.
(2) Clean the grease gun, and pack clean grease.
(3) Supply grease.

When supplying grease to the insert bearing unit, turning of the shaft with your hands or turning of the bearing unit at a low speed is recommended.

It allows appropriate discharge of old grease and even supply of fresh grease into the bearing.

If the grease supply with the grease nipple of the standard type (type A) is difficult because of the structure of the machine, grease nipples of the type B or type C are also available. Contact JTEKT.

Fig. 14.14 shows the types of grease nipples.

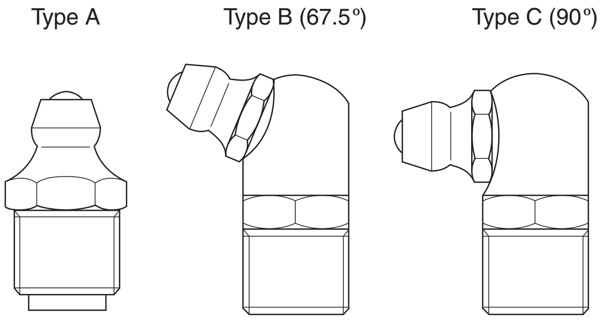

Fig. 14.14 Types of grease nipple for insert bearing unit

When supplying many insert bearing units with the centralized lubricating device, use soft grease with consistency from about 300 to 380, and provide piping appropriately so that grease of the specified amount is supplied.

Piping to the insert bearing unit should be provided with the tapped hole of the grease nipple of the housing. However, if size of the tapped hole on the housing differs from that of thread of the piping, use the reducing socket.

Fig. 14.15 shows the structure of the reducing socket for centralized lubricating.

When executing centralized lubricating, it is effective for the lubricating surface of the bearing to supply grease of the amount shown in **Table 14.5** by dividing into several times.

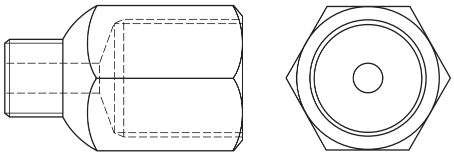

Fig. 14.15 Reducing socket for centralized lubricating

For details of grease nipples and reducing sockets, see **“16 Parts and accessories”**.

14.5 Replacing bearing

Since the bearings and the housings of Koyo Insert Bearing Units are compatible, if a bearing is faulty, it can be replaced and used continuously.

Replacing procedures of the bearing of the insert bearing unit are shown below.

(1) Remove the bearing unit from the shaft and the base.

(2) Screw in the set screw so that the head of the set screw does not project out from the outside diameter surface of the inner ring of the bearing.
Head of the set screw may be hooked on the housing when the bearing is tilted.

(3) Turn the bearing by 90º with a handle of a hammer until the bearing is horizontal.

(4) Take out the bearing from the bearing groove of the housing.

To fit a new bearing to the housing, reverse the removing procedures.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF........ 201~210, X05~X09, 305~308
A-R1/8.................. 211~218, X10~X20, 309~328
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : UCP206JL3, UC206L3)
4. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Representative examples of the forms of housing are indicated.
6. Housings of spheroidal graphite iron casting are also available.

UCP

Cylindrical bore (with set screws)

d (45) ~ (75) mm

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)

2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF........ 201~210, X05~X09, 305~308
A-R1/8................. 211~218, X10~X20, 309~328

3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : UCP206JL3, UC206L3)

4. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.

5. Representative examples of the forms of housing are indicated.

6. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 201~210, X05~X09, 305~308
A-R1/8 .... 211~218, X10~X20, 309~328
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : UCP206JL3, UC206L3)
4. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Representative examples of the forms of housing are indicated.
6. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 201~210
A-R1/8 .... 211~215
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : NAP206JL3, NA206L3)
4. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Representative examples of the forms of housing are indicated.
6. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)

2. Part No. of applicable grease nipples are shown below.

A-1/4-28UNF .... 205~210, X05~X09, 305~308
A-R1/8 .... 211~218, X10~X20, 309~328

3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables. (Example of Part No. : UKP206J + H2306X, UK206 + H2306X)

4. As for the triple-lip seal type product (205 is the double-lip seal type product), supplementary code L3 (or L2) follows the Part No. of unit or bearing.

5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of insert bearing for unit and adapter assemblies.

6. Representative examples of the forms of housing are indicated.

7. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)

2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 205~210, X05~X09, 305~308
A-R1/8 .... 211~218, X10~X20, 309~328

3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables.
(Example of Part No. : UKP206J + H2306X, UK206 + H2306X)

4. As for the triple-lip seal type product (205 is the double-lip seal type product), supplementary code L3 (or L2) follows the Part No. of unit or bearing.

5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of insert bearing for unit and adapter assemblies.

6. Representative examples of the forms of housing are indicated.

7. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)

2. Part No. of applicable grease nipples are shown below.

A-1/4-28UNF .... 208~210
A-R1/8 .... 211~213, 313~328

3. As for the triple-lip seal type product, supplementary code L3 follows the Part No. of unit or bearing. (Example of Part No. : UCIP208JL3, UC208L3)

4. As for the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.

5. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF........ 208~210
A-R1/8.................. 211~213, 313~328
3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables.
(Example of Part No. : UKIP208J + H2308X, UK208 + H2308X)
4. As for the triple-lip seal type product, supplementary code L3 follows the Part No. of unit or bearing.
(Example of Part No. : UKIP208JL3 + H2308X, UK208L3 + H2308X)
5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of insert bearing for unit and adapter assemblies.
6. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit, fitting codes follow bore diameter codes. (See **Table 2.5** in P.11.)
2. Part No. of the applicable grease nipple is A-1/4-28UNF.
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (or L2) follows Part No. of unit or bearing. (Example of Part No. : UCPA206JL3, UC206L3)
4. As for the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Tapered bore (with adapter) type products are also available. (Example of Part No. : UKPA205J + H2305X, UK205 + H2305X)
6. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit, fitting codes follow bore diameter codes. (See **Table 2.5** in P.11.)
2. Part No. of the applicable grease nipple is A-1/4-28UNF.
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (or L2) follows Part No. of unit or bearing. (Example of Part No. : UCPH206JL3, UC206L3)
4. As for the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Tapered bore (with adapter) type products are also available. (Example of Part No. : UKPH205J + H2305X, UK205 + H2305X)

Remarks 1. In Part No. of unit, fitting codes follow bore diameter codes. (See **Table 2.5** in P.11.)
2. Allowable load to housing in radial direction is approximately half of basic load rating of bearing, C_r (when safety factor is 4).
3. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF........ 201~210, X05~X09, 305~308
A-R1/8.................. 211~218, X10~X20, 309~328

3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No. : UCF206JL3, UC206L3)
4. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)

2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 201~210, X05~X09, 305~308
A-R1/8 .... 211~218, X10~X20, 309~328

3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No. : UCF206JL3, UC206L3)

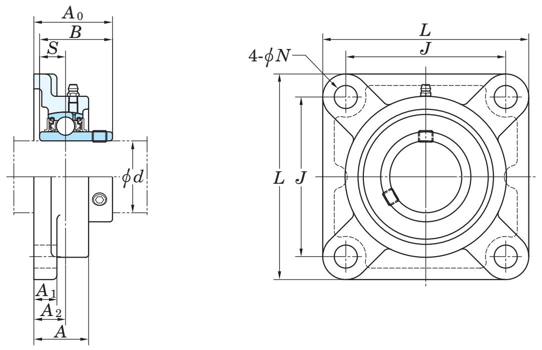
4. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.

5. Housings of spheroidal graphite iron casting are also available.

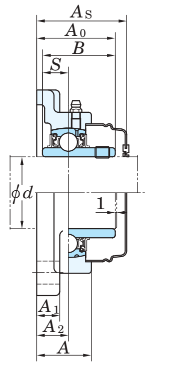
UCF

Cylindrical bore (with set screws)

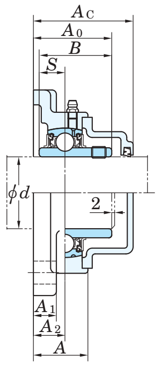
d (75) ~ 140 mm

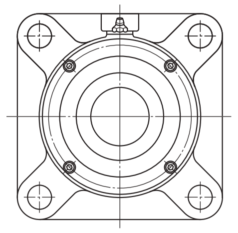


With Pressed Steel Cover
(E1)



With Cast Iron Cover
(E3)





Cast iron cover fixing screw position
(standard)

Variations of tolerance of distance from mounting surface to center of spherical bore (Δ_{A2s}) and tolerance of position of bolt hole (X)

Unit: mm

Housing No.			Δ_{A2s}	X
F204~F210	FX05~FX10	F305~F310	±0.5	0.7
F211~F218	FX11~FX20	F311~F328	±0.8	1

Variations of tolerance of bolt hole diameter (Δ_{Ns})

Unit: mm

Housing No.			Δ_{Ns}
F204~F218	FX05~FX18	F305~F315	±0.2
	FX20	F316~F328	±0.3

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 201~210, X05~X09, 305~308
A-R1/8 .... 211~218, X10~X20, 309~328
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No. : UCF206JL3, UC206L3)
4. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 201~210
A-R1/8 .... 211~212
3. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
4. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)

2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 205~210, X05~X09, 305~308
A-R1/8 .... 211~218, X10~X20, 309~328

3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables. (Example of Part No. : UKF206J + H2306X, UK206 + H2306X)

4. As for the triple-lip seal type product (205 is the double-lip seal type product), supplementary code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No. : UKF206JL3 + H2306X, UK206L3 + H2306X)

5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of insert bearing for unit and adapter assemblies.

6. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 205~210, X05~X09, 305~308
A-R1/8 .... 211~218, X10~X20, 309~328

3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables.
(Example of Part No. : UKF206J + H2306X, UK206 + H2306X)
4. As for the triple-lip seal type product (205 is the double-lip seal type product), supplementary code L3 (L2) follows the Part No. of unit or bearing.
(Example of Part No. : UKF206JL3 + H2306X, UK206L3 + H2306X)
5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of insert bearing for unit and adapter assemblies.
6. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
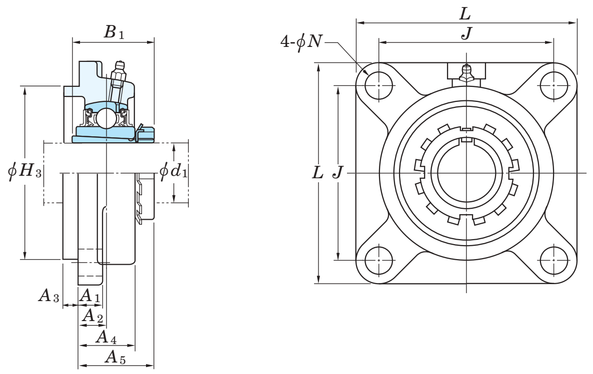
A-1/4-28UNF .... 305~308
A-R1/8 .... 309~328
3. As for the triple-lip seal type product, supplementary code L3 follows the Part No. of unit or bearing.
(Example of Part No. : UCFS307JL3, UC307L3)
4. The dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Housings of spheroidal graphite iron casting are also available.

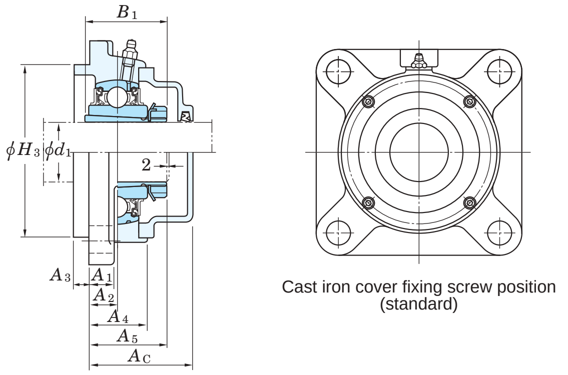
UKFS

Tapered bore (with adapter)

d_1 20 ~ 125 mm



With Cast Iron Cover
(E3)



Cast iron cover fixing screw position
(standard)

Variations of tolerance of spigot joint outside diameter ($\varDelta_{H3s}$), variations of tolerance of distance from mounting surface to center of spherical bore ($\varDelta_{A2s}$), tolerance of position of bolt hole (X), and tolerance of circumferential runout of spigot joint (Y)

Unit: mm

Housing No.	$\varDelta_{H3s}$	$\varDelta_{A2s}$	X	Y

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 305~308
A-R1/8 .... 309~328
3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables.
(Example of Part No. : UKFS307J + H2307X, UK307 + H2307X)
4. As for the triple-lip seal type product, supplementary code L3 follows the Part No. of unit or bearing.
(Example of Part No. : UKFS307JL3 + H2307X, UK307L3 + H2307X)
5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of insert bearing for unit and adapter assemblies.
6. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 201~210, X05~X09, 305~308
A-R1/8 .... 211~218, X10, 309~324
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : UCFL206JL3, UC206L3)
4. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 201~210
A-R1/8 .... 211~217
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : UCFL206EJL3, UC206L3)
4. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Housings of spheroidal graphite iron casting are also available.

UCFL-E

Remarks
1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
   A-1/4-28UNF .... 205~210, X05~X09, 305~308
   A-R1/8 .... 211~218, X10, 309~324
3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables.
   (Example of Part No. : UKFL206J + H2306X, UK206 + H2306X)
4. As for the triple-lip seal type product (205 is the double-lip seal type product), supplementary code L3 (or L2) follows the Part No. of unit or bearing.
   (Example of Part No. : UKFL206JL3 + H2306X, UK206L3 + H2306X)
5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of insert bearing for unit and adapter assemblies.
6. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 205~210, X05~X09, 305~308
A-R1/8 .... 211~218, X10, 309~324
3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables.
(Example of Part No. : UKFL206J + H2306X, UK206 + H2306X)
4. As for the triple-lip seal type product (205 is the double-lip seal type product), supplementary code L3 (or L2) follows the Part No. of unit or bearing.
(Example of Part No. : UKFL206JL3 + H2306X, UK206L3 + H2306X)
5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of insert bearing for unit and adapter assemblies.
6. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter codes. (See **Table 2.5** in P.11.)
2. Housing is made from special light alloy.
3. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF........ 201~210, X05~X09
A-R1/8.................. 211~218, X10~X20
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No. : UCFC206JL3, UC206L3)
4. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Housings of spheroidal graphite iron casting are also available.

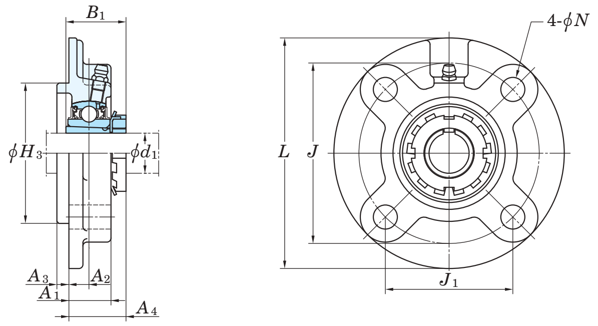
Remarks 1. In Part No. of unit, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... X05~X09
A-R1/8 .... X10~X20
3. As for the triple-lip seal type product, supplementary code L3 follows the Part No. of unit or bearing. (Example of Part No. : UCFCX06EL3, UCX06L3)
4. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Housings of spheroidal graphite iron casting are also available.

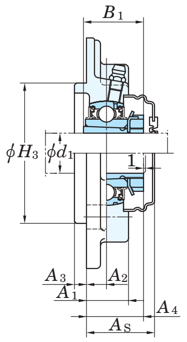
UKFC

Tapered bore (with adapter)

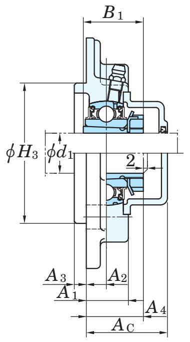
d_1 20 ~ 65 mm



With Pressed Steel Cover
(E1)



With Cast Iron Cover
(E3)



Variations of tolerance of spigot joint outside diameter (Δ_{H3s}), variations of tolerance of distance from mounting surface to center of spherical bore (Δ_{A2s}), tolerance of position of bolt hole (X), and tolerance of circumferential runout of spigot joint (Y)

Unit: mm

Housing No.		Δ_{H3s}	Δ_{A2s}	X	Y

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)

2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 205~210, X05~X09
A-R1/8 .... 211~218, X10~X20

3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables.
(Example of Part No. : UKFC206J + H2306X, UK206 + H2306X)

4. As for the triple-lip seal type product (205 is the double-lip seal type product), supplementary code L3 (or L2) follows the Part No. of unit or bearing.
(Example of Part No. : UKFC206JL3 + H2306X, UK206L3 + H2306X)

5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of insert bearing for unit and adapter assemblies.

6. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
B-1/4-28UNF .... 201~210, X05~X09, 305~308
B-R1/8 .... 211~217, X10~X17, 309~328
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No. : UCT206JL3, UC206L3)
4. As for the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
B-1/4-28UNF........ 201~210, X05~X09, 305~308
B-R1/8................. 211~217, X10~X17, 309~328
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No. : UCT206JL3, UC206L3)
4. As for the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Housings of spheroidal graphite iron casting are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
B-1/4-28UNF .... 201~210, X05~X09
B-R1/8 .... 211~217, X10~X17
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No. : UCT206EL3, UC206L3)
4. As for the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
5. Housings of spheroidal graphite iron casting are also available.

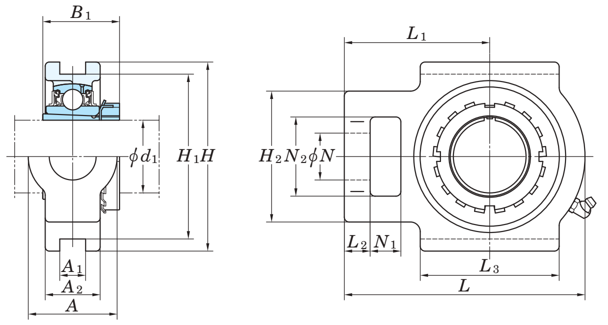
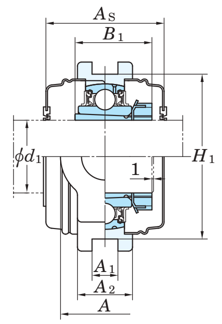
UKT

Tapered bore (with adapter)

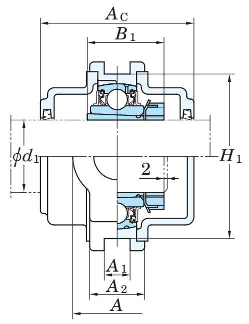
d_1 20 ~ 50 mm

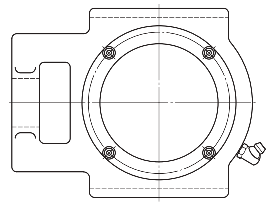


With Pressed Steel Covers
(E1)



With Cast Iron Covers
(E3)





Cast iron cover fixing screw position
(standard)

Variations of tolerance of groove width (Δ_{A1s}), variations of tolerance of distance between both grooves (Δ_{H1s}), and tolerance of symmetry of both groove sides (X)

Unit: mm

Housing No.			Δ_{A1s}	Δ_{H1s}	X

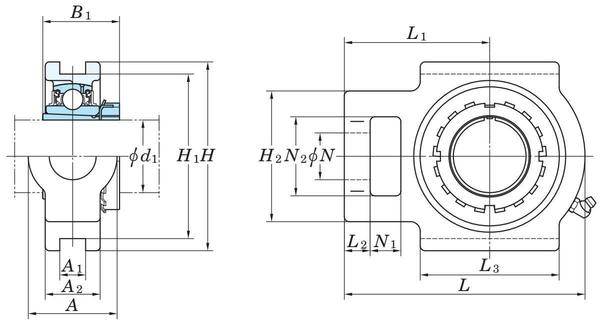
Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
B-1/4-28UNF .... 205~210, X05~X09, 305~308
B-R1/8 .... 211~217, X10~X17, 309~328
3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables. (Example of Part No. : UKT206J + H2306X, UK206 + H2306X)
4. As for the triple-lip seal type product (205 is the double-lip seal type product), supplementary code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : UKT206JL3 + H2306X, UK206L3 + H2306X)
5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of insert bearing for unit and adapter assemblies.
6. Housings of spheroidal graphite iron casting are also available.

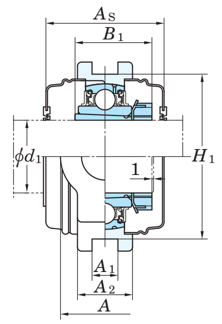
UKT

Tapered bore (with adapter)

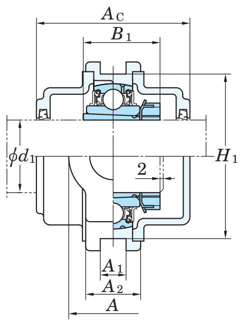
d_1 55 ~ 125 mm

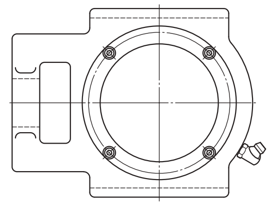


With Pressed Steel Covers
(E1)



With Cast Iron Covers
(E3)





Cast iron cover fixing screw position
(standard)

Variations of tolerance of groove width (Δ_{A1s}), variations of tolerance of distance between both grooves (Δ_{H1s}), and tolerance of symmetry of both groove sides (X)

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)

2. Part No. of applicable grease nipples are shown below.
   B-1/4-28UNF .... 205~210, X05~X09, 305~308
   B-R1/8 .... 211~217, X10~X17, 309~328

3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables. (Example of Part No. : UKT206J + H2306X, UK206 + H2306X)

4. As for the triple-lip seal type product (205 is the double-lip seal type product), supplementary code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : UKT206JL3 + H2306X, UK206L3 + H2306X)

5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of insert bearing for unit and adapter assemblies.

6. Housings of spheroidal graphite iron casting are also available.

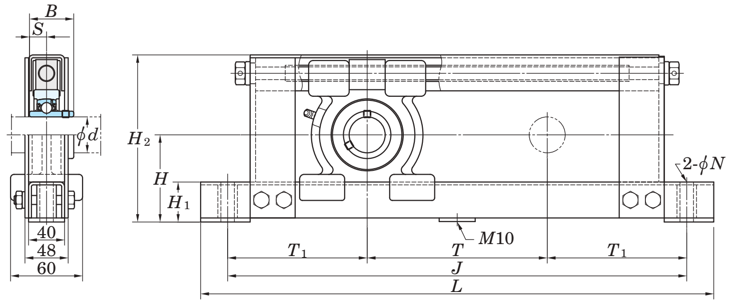
Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
B-1/4-28UNF .... 201~210
B-R1/8 .... 211~213
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : UCTH206JL3-150, UC206L3)
4. If heavy load ($P_r/C_r > 0.12$), vibration, or impact occurs, contact with JTEKT.
5. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.
6. Tapered bore (with adapter) type products are also available.
(Example of Part No. : UKTH205J-150 + H2305X, UK205 + H2305X)

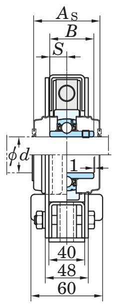
UCTL

Cylindrical bore (with set screws)

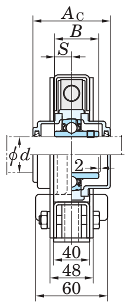
d 20 ～ 45 mm



With Pressed Steel Covers
(E1)



With Cast Iron Covers
(E3)



Variations of tolerance of distance from mounting bottom to center of spherical bore (Δ_{Hs}) and variations of tolerance of distance between centers of bolt holes (Δ_{Js})

Unit: mm

Nominal unit code	Δ_{Hs}	Δ_{Js}

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter codes. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples is C-1/4-28UNF.
3. As for the triple-lip seal type product (204 and 205 are the double-lip seal type products), supplementary code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : UCTL206JL3-100, UC206L3)
4. The unit should be mounted so that load is applied to the frame mounting surface vertically and downward.
5. If heavy load ($P_r/C_r > 0.12$), vibration, or impact occurs, contact with JTEKT.
6. Tapered bore (with adapter) type bearing units are also available. (Example of Part No. : UKTL206J-100 + H2306X, UK206 + H2306X)
7. If frame parts need to be corrosion resistant, contact with JTEKT.
8. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
C-1/4-28UNF........ 208~210
C-R1/8................. 211, 212, 313~318
3. As for the triple-lip seal type product, supplementary code L3 follows the Part No. of unit or bearing.
(Example of Part No. : UCTU208JL3-500, UC208L3)
4. The unit should be mounted so that load is applied to the frame mounting surface vertically and downward.
5. If heavy load ($P_r/C_r > 0.12$), vibration, or impact occurs, contact with JTEKT.
6. Tapered bore (with adapter) type bearing units are also available. (Example of Part No. : UKTU208J-500 + H2308X, UK208 + H2308X)
7. If frame parts need to be corrosion resistant, contact with JTEKT.
8. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 201~213, X05~X12, 305~308
A-R1/8 .... 309~328
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No. : UCC206JL3, UC206L3)
4. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.

Remarks
1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
   A-1/4-28UNF........ 201~213, X05~X12, 305~308
   A-R1/8.................. 309~328
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No. : UCC206JL3, UC206L3)
4. For the dimensions and forms of applicable bearings, see the dimensional tables of insert bearing for unit.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF .... 205~213, X05~X12, 305~308
A-R1/8 .... 309~328
3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables. (Example of Part No. : UKC206J + H2306X, UK206 + H2306X)
4. As for the triple-lip seal type product (205 is the double-lip seal type product), supplementary code L3 (or L2) follows the Part No. of unit or bearing.
(Example of Part No. : UKC206JL3 + H2306X, UK206L3 + H2306X)
5. As for the dimensions and forms of applicable bearings and adapters, see the dimensional tables of insert bearing for unit and adapter assemblies.

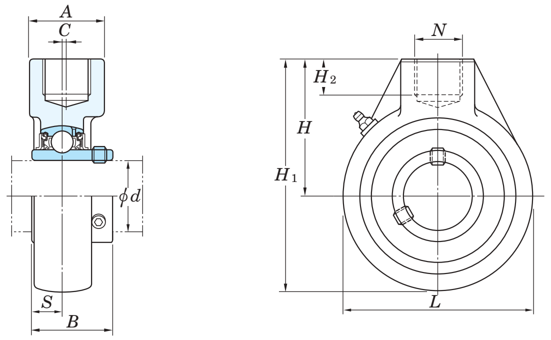
UCHA

Cylindrical bore (with set screws)

d 12 ~ 75 mm



Note 1) Dimensions N screw hole is apply JIS B0203 (Taper Pipe Threads) standards.
It can not apply to the Parallel Pipe External Thread.
Also, below shown the dimensions of Taper Pipe Internal Thread.

Unit: mm

Nominal of Thread	Female Thread Major Diameter D	Female Thread Pitch Diameter D_2	Female Thread Minor Diameter D_1	Thread Number of Threads (in 25.4 mm) n	Apply Male Thread

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 2.5** in P.11.)
2. Part No. of applicable grease nipples are shown below.
A-1/4-28UNF........ 201~210
A-R1/8.................. 211~215
3. As for the triple-lip seal type product (from 201 to 205 are the double-lip seal type products), supplementary code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : UCHA206JL3, UC206L3)
4. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of insert bearing for unit and adapter assemblies.
5. Tapered bore (with adapter) type products are also available. (Example of Part No. : UKHA205J + H2305X, UK205 + H2305X)

Remarks 1. SU type product is the “compact” series insert bearing for unit.
2. From UC201 to 205 are the double-lip seal type products (L2).
3. With all bearings, the type with lock pin are H fittings.
However, bearings with a bearing number of UC313 or more, with lock pin type are J fittings.

Remarks 1. SU type product is the “compact” series insert bearing for unit.
2. From UC201 to 205 are the double-lip seal type products (L2).
3. With all bearings, the type with lock pin are H fittings.
However, bearings with a bearing number of UC313 or more, with lock pin type are J fittings.

Remarks 1. SU type product is the “compact” series insert bearing for unit.
2. From UC201 to 205 are the double-lip seal type products (L2).
3. With all bearings, the type with lock pin are H fittings.
However, bearings with a bearing number of UC313 or more, with lock pin type are J fittings.

Remarks 1. In Part No. of unit with adapters, Part No. of applicable adapters follow the Part No. shown in the dimensional tables.
(Example of Part No. : UK206 + H2306X, UK206L3 + H2306X)

2. Adapter series applicable to UK200 series
UK200....................... H2300X series
UK200L3 (or L2) .... H2300X series
3. UK205 is the double-lip seal type product (L2).
4. Inch bore diameter series adapters are also available (see the dimensional tables of adapters assemblies).
5. Of all the products, the lock pin types are H fittings.

Remarks 1. In Part No. of unit with adapters, Part No. of applicable adapters follow the Part No. shown in the dimensional tables.
(Example of Part No. : UK206 + H2306X, UK206L3 + H2306X)

2. Adapter series applicable to UK200 series
UK200....................... H2300X series
UK200L3 (or L2) .... H2300X series
3. UK205 is the double-lip seal type product (L2).
4. Inch bore diameter series adapters are also available (see the dimensional tables of adapters assemblies).
5. Of all the products, the lock pin types are H fittings.

Note 1) Items in parentheses are applicable to the pillow block type (P), square-flanged type (F), rhombic-flanged type (FL), and the take-up type (T) bearings, and can be mounted to housings with three hexagon socket head cap screws (use four to mount other items).

2) Items in parentheses are applicable to the round-flanged type with joint (FC), and can be mounted to housings with three hexagon socket head cap screws (use four to mount other items).

Remark In the nominal No. of the cast iron covers for shouldered shaft, shaft diameter follows the basic code of the cover. For example, Part No. of the covers for a shaft with 60 mm diameter for UC210 is 210FC×60.

16.3 Part No. of stainless covers

17 Example of application

Koyo Insert Bearing Units are used in varied equipment, and their performance contributes to technical advantages, automation, and energy-saving of equipment.

Automatic warehouse system

Many insert bearing units are used in automatic warehouse systems for automation and energy-saving of the systems.

Automatic warehouse system

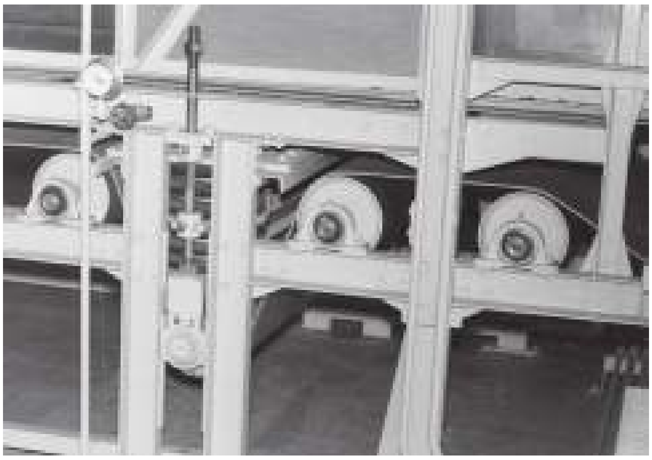
Mast driving system

Conveyor

Delivery center

Koyo Insert Bearing Units of various types including pillow block type, flange type, take-up type are used in conveyors of delivery centers.

Belt conveyor



Belt conveyor driving system

Belt conveyor driving system

Soft drink plant

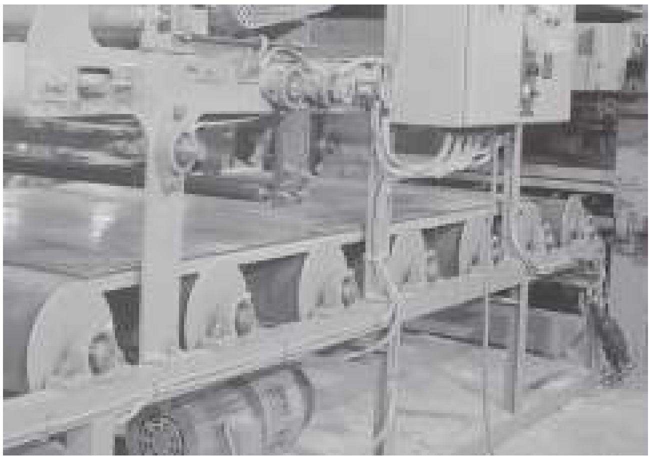
Since soft drink manufacturing facilities are frequently cleaned for hygiene control, covered unit, “compact” series unit, and stainless-series unit are suitable for them.

Bottle filling line conveyor

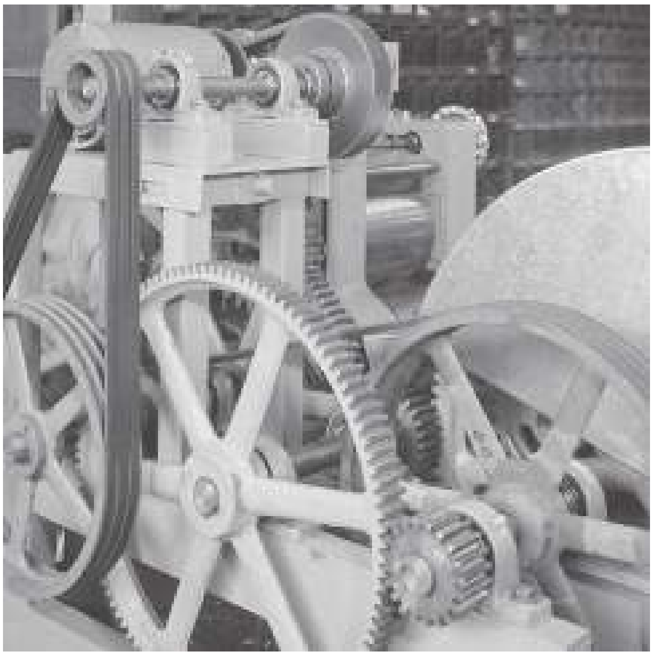
Pallet driving system

Noodle manufacturing plant

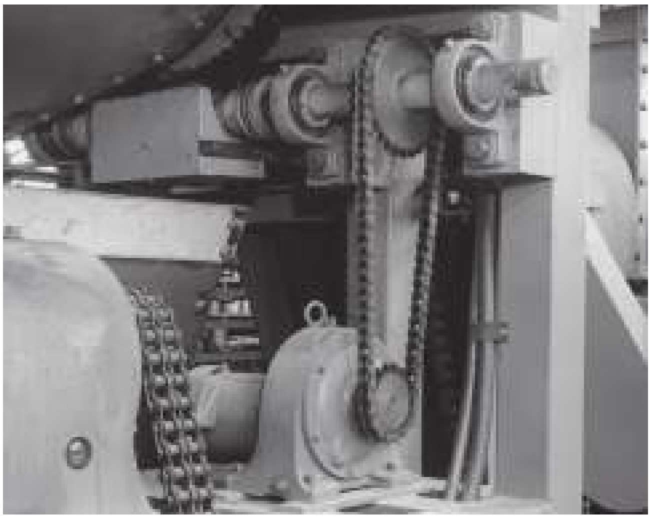
Triple-lip seal units or covered units are suitable for locations dusted with a great deal of noodle flour.



Feeding system



Noodle manufacturing machine driving system

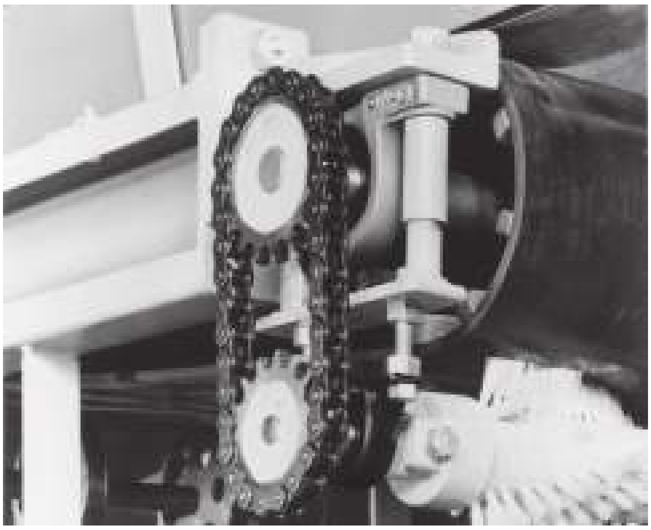


Mixer driving system

Tea manufacturing plant

Koyo Insert Bearing Units contribute to the automation of tea manufacturing lines and downsizing of tea manufacturing machines.

Tea processor driving system



Conveyor driving system

Packing machine

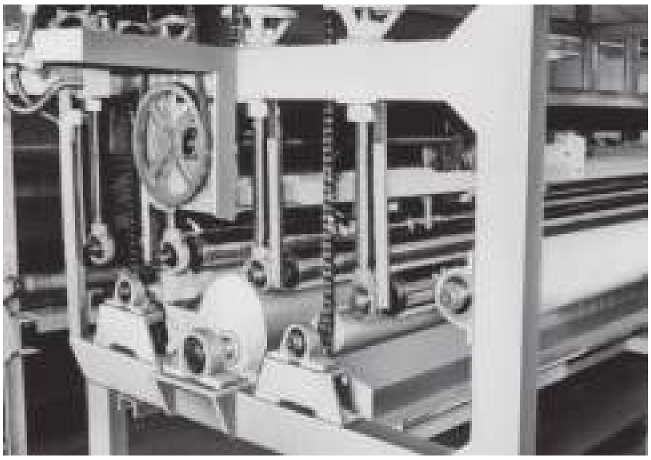
Koyo Insert Bearing Units, used in transmission units, cam shafts, and conveyors, contribute to high-efficiency and automation of packing lines.

Packing machine

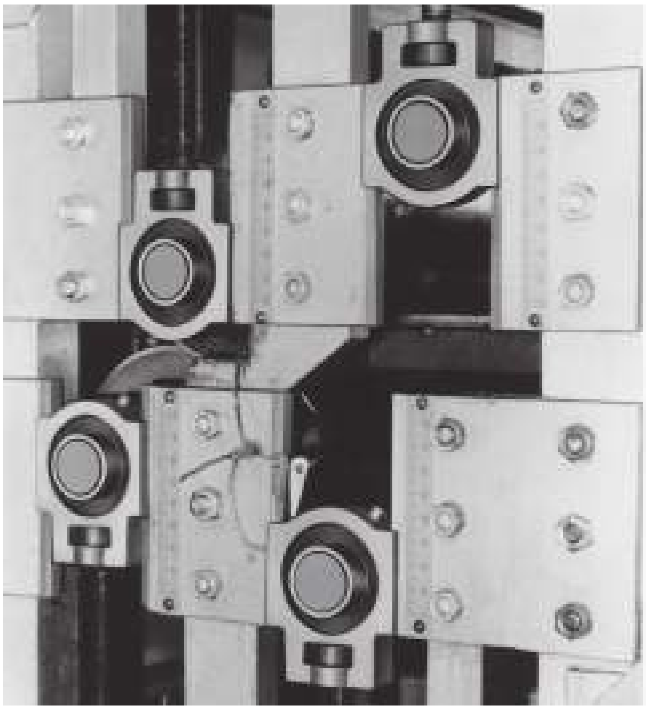
Cam shaft

Textile machine

Take-up units are suitable for locations where adjustment of distance between shaft axes is required, while hanger units are suitable for locations where the shaft must be hung because of the structure of the machine.



Carpet pasting system

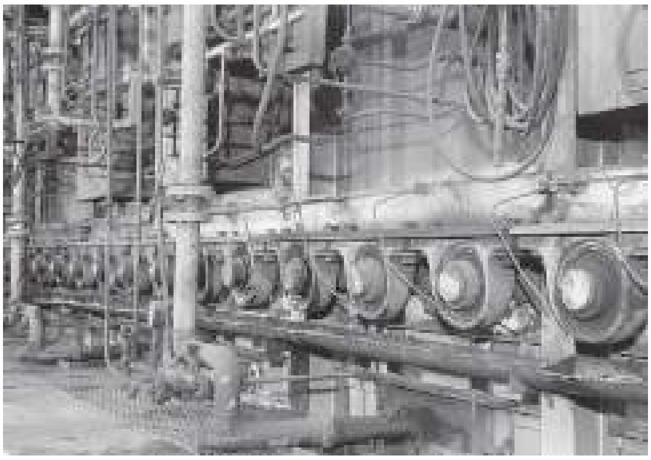


Carpet feeding shaft

Heat treatment system

The heat resistant unit is used for applications at a high temperature.

Carburizing furnace



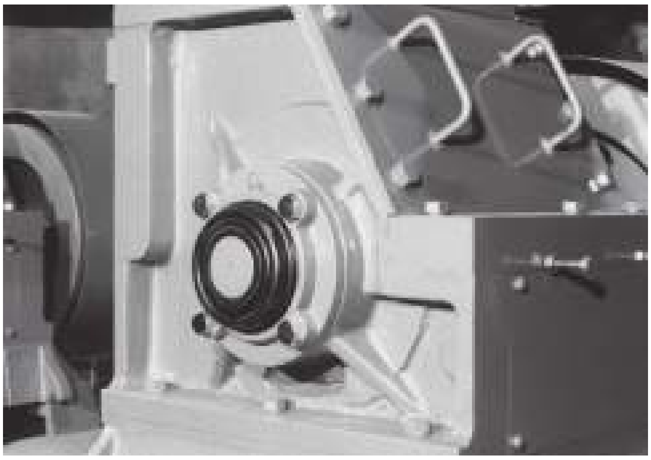
Heat treatment furnace

Agricultural machine

Koyo Insert Bearing Units contribute to downsizing and high-performance of agricultural machines. Triple-lip seal units or covered units are suitable for locations where are subject to a great deal of mud water and dusts.

Small wagon

Beat harvester power transmission system



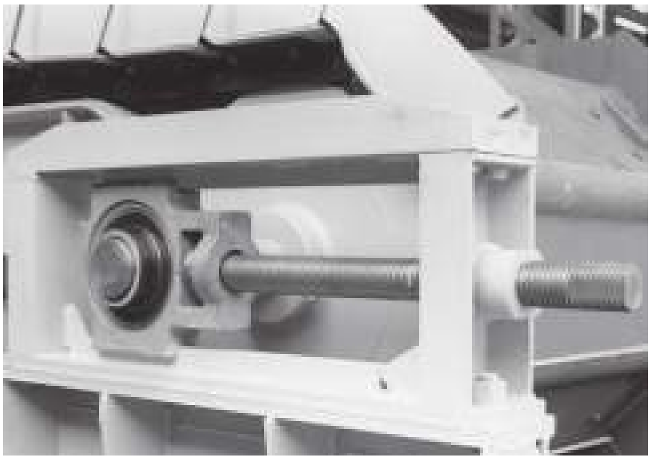
Grain mill

Construction machinery

Koyo Insert Bearing Units contribute to high-performance and longer service life of construction machinery used under severe environment.

Concrete mixer

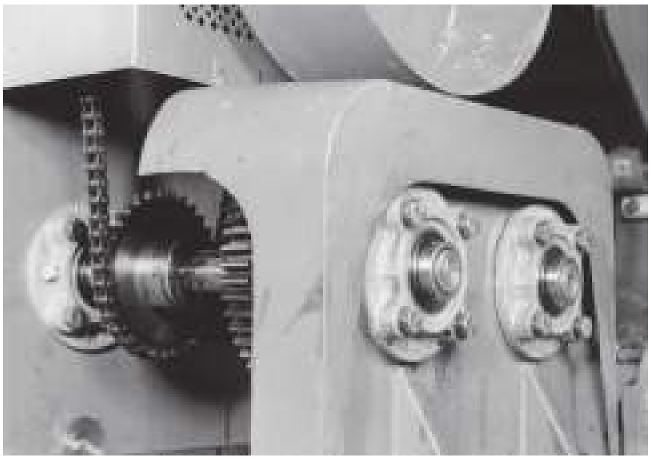
Conveyor



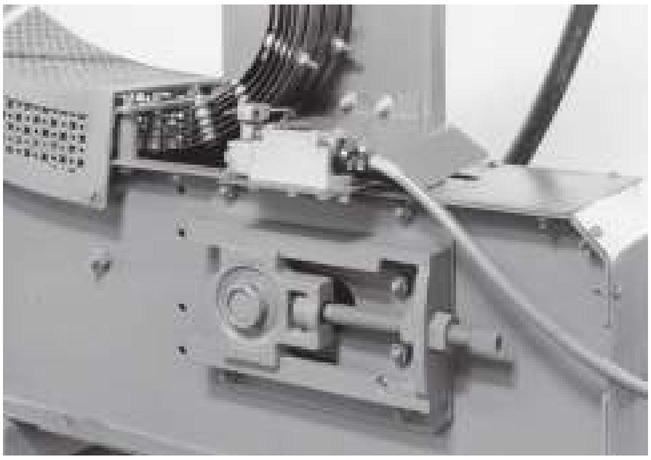
Conveyor

Other applications

Insert Bearing Units of various types appropriate for applications and specifications are used.



(Round-flanged type with spigot joint)



(Take-up type unit)

(Pillow block type unit)

Thermal conductivity	W/ (m · K)	W/ (m · °C) cal/ (s · m · °C)	1 W/ (m · °C) = 1 W/ (m · K) 1 cal/ (s · m · °C) = 4.186 05 W/ (m · K)	
Coefficient of heat transfer	W/ (m^2 · K)	W/ (m^2 · °C) cal/ (s · m^2 · °C)	1 W/ (m^2 · °C) = 1 W/ (m^2 · K) 1 cal/ (s · m^2 · °C) = 4.186 05 W/ (m^2 · K)	
Heat capacity	J/K	J/°C	1 J/°C = 1 J/K	
Massic heat capacity	J/ (kg · K)	J/ (kg · °C)		

Note 1) ∗ : Unit can be used as an SI unit.
No asterisk : Unit cannot be used.

Supplementary Table 8 (4) SI units and conversion factors

Mass	SI units	Other Units[1)]	Conversion into SI units	Conversion from SI units
Electric current	A [ampere(s)]			
Electric charge, quantity of electricity	C [coulomb(s)] {1 C = 1 A · s}	A · h ∗	1 A · h = 3.6 kC	
Tension, **electric potential**	V [volt(s)] {1 V = 1 W/A}			
Capacitance	F [farad(s)] {1 F = 1 C/V}			
Magnetic field strength	A/m	Oe [oersted(s)]	1 Oe = $\frac{10^3}{4\pi}$ A/m	1 A/m = $4\pi \times 10^{-3}$ Oe
Magnetic flux density	T [tesla(s)] $\left\{\begin{array}{l}1\ \mathrm{T} = 1\ \mathrm{N/(A \cdot m)} \\ \quad = 1\ \mathrm{Wb/m^2} \\ \quad = 1\ \mathrm{V \cdot s/m^2}\end{array}\right\}$	Gs [gauss(es)] γ [gamma(s)]	1 Gs = 10^{-4} T 1 γ = 10^{-9} T	1 T = 10^4 Gs 1 T = 10^9 γ
Magnetic flux	Wb [weber(s)] {1 Wb = 1 V · s}	Mx [maxwell(s)]	1 Mx = 10^{-8} Wb	1 Wb = 10^8 Mx
Self inductance	H [henry (– ries)] {1 H = 1 Wb/A}			
Resistance (to direct current)	Ω [ohm(s)] {1 Ω = 1 V/A}			
Conductance (to direct current)	S [siemens] {1 S = 1 A/V}			
Active power	W $\left\{\begin{array}{l}1\ \mathrm{W} = 1\ \mathrm{J/s} \\ \quad = 1\ \mathrm{A \cdot V}\end{array}\right\}$			

Note 1) ∗ : Unit can be used as an SI unit.
No asterisk : Unit cannot be used.

Traction Drive Unit

Reducer for high-accuracy feeding

Minimal rotation irregularity

No backlash

Low noise, low vibration

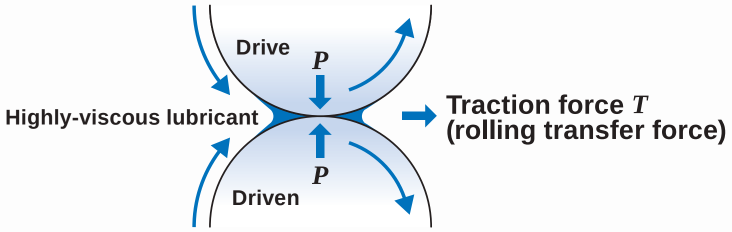
JTEKT CORPORATION

CAT.NO.B1011E

A Traction Drive Unit
conceived from bearing core technologies

The traction drive unit is a power transmission based on the rolling contact between rollers and is capable of smooth, rattle-free power transfer. High-accuracy and high-strength rollers are subjected to elastic deformation prior to assembly, achieving high pressure force. Additionally, by introducing traction grease that becomes highly viscous under high pressure, it is possible to achieve excellent power transfer while securing lubricity.

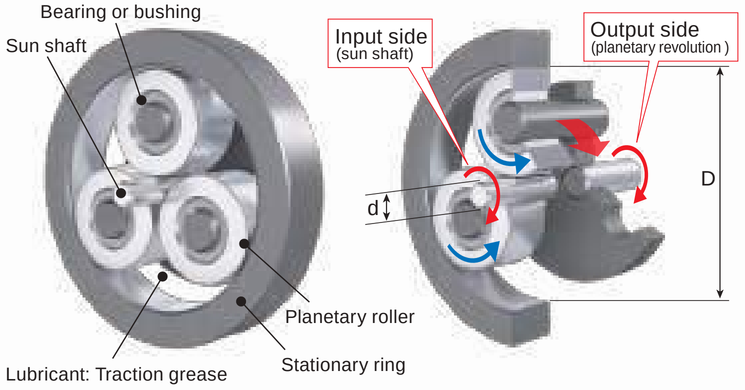
Principle and Structure



Traction force $T=\mu P$

μ:Traction coefficient

P:Pressure force



Reduction ratio $i=\dfrac{D+d}{d}$

D:Stationary ring bore diameter

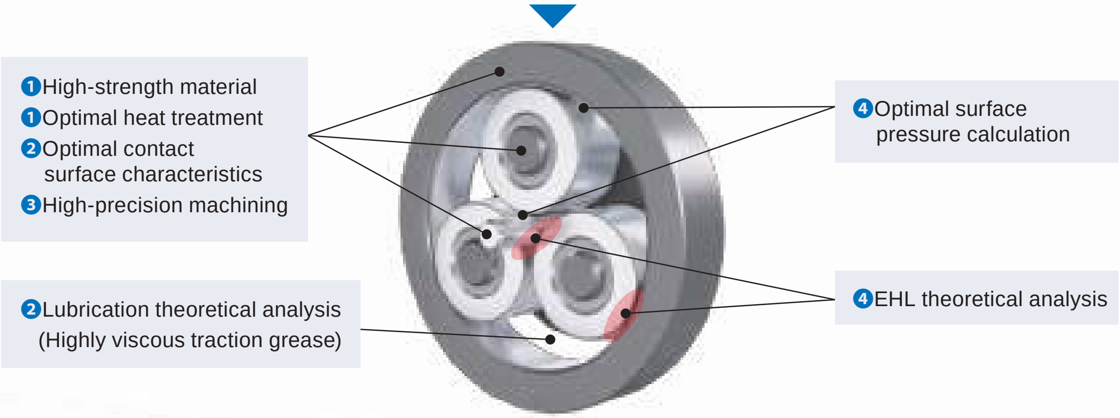
d:Sun shaft outer diameter

Reduction ratio: 3 - 12 (1-stage)
Large reduction ratio is possible
if made multistage

Application of JTEKT Core Technologies

Taking bearing technologies accumulated over many years under the KOYO brand and applying them to traction drive units.

- ❶Materials, heat treatment technology
- ❸High-precision machining technology
- ❷Tribology technology
- ❹Analysis technology



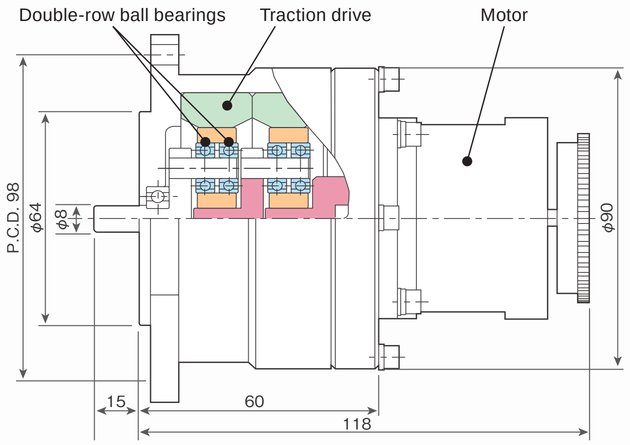
Rotation stability | **No backlash** | **Low noise, low vibration**

Ideal for High-accuracy Feeding

Specification Examples

No Backlash Type

Backlash has been eliminated and friction reduced by adjusting the internal clearance of the ball bearings in the planetary roller.



Reduction ratio	100 (2-stage reduction)
Torque (output shaft)	2N•m
Rotating speed fluctuation coefficient	±0.5% or less
Backlash	0.01deg or less

Compact Type

The compact design incorporates a bushing in the planetary roller.

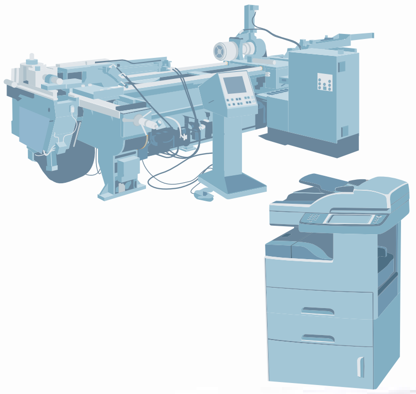
	①	②
Reduction ratio	10	5
Torque (output shaft)	2〜4N•m	7.5〜12N•m
Rotating speed fluctuation coefficient	±0.5% or less	

Customization according to customer requests is available, so please do not hesitate to contact us.

Application Examples

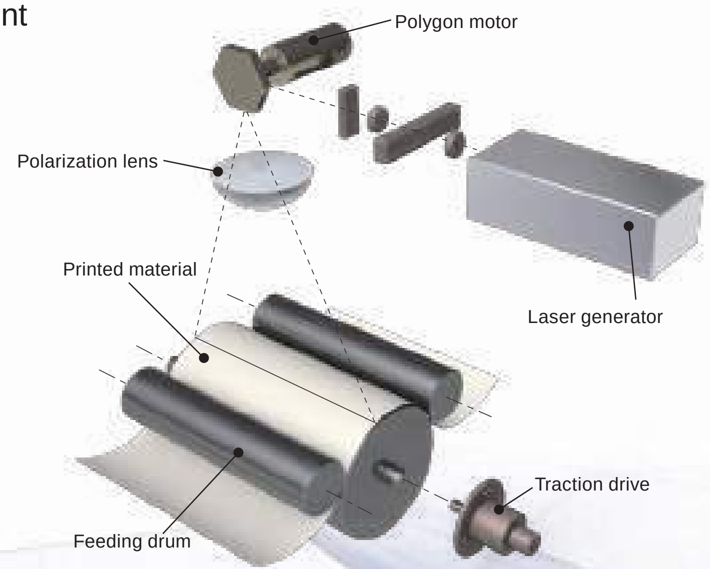
- Printers
- Machine tools
- FPD manufacturing equipment
- ROBOT

And more



Eliminate speed irregularity of feeding drum

Contributes to improving image quality



Reducer with a Minimal Rotation Irregularity Unachievable Using Gears

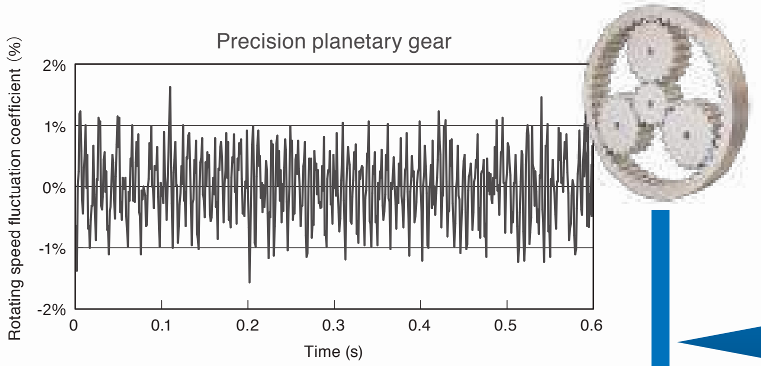
Features

Comparison with planetary gear

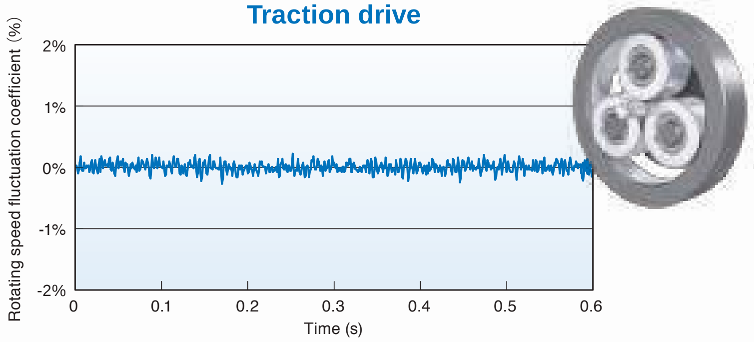
Mechanism	Rotation irregularity	Backlash	Noise/Vibration	High-speed performance	Torque capacity
Traction drive	◎	◎	◎	○	△
Planetary gear	△	△	△	△	◎

Measurement examples

1 Rotation irregularity



Reduced by 80%

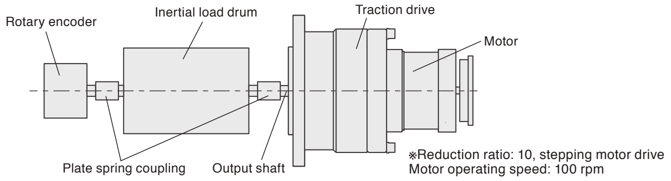


Rotating speed fluctuation coefficient (%) = (Rotation irregularity)

$$\frac{\text{Speed fluctuation}}{\text{Average rotating speed of output shaft}} \times 100$$

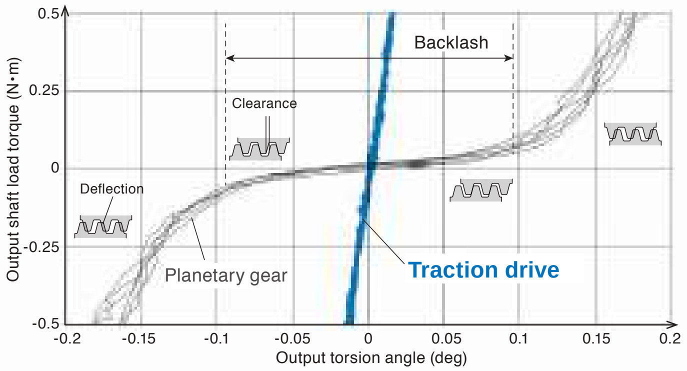
Measurement method

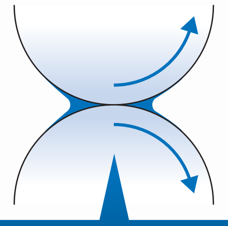
Run the motor at a set speed measuring rotating speed of the output shaft using the rotary encoder



※Reduction ratio: 10, stepping motor drive
Motor operating speed: 100 rpm

2 Backlash

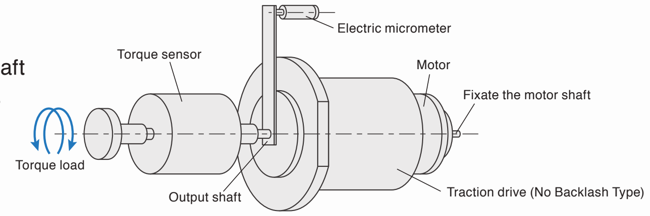




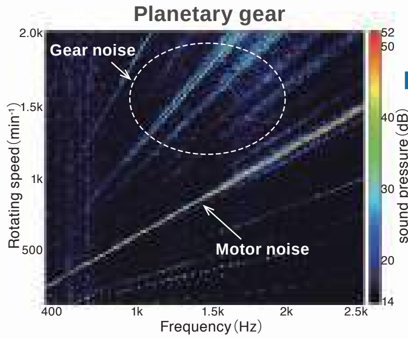
No Backlash

Measurement method

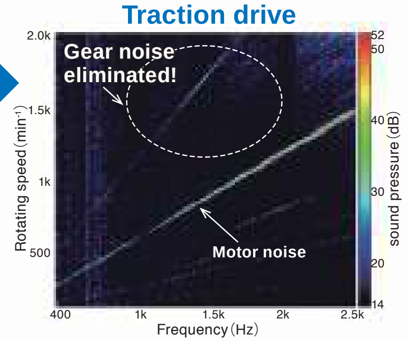
Measure the torsion angle of the output shaft when the motor shaft is fixed and torque is applied to the output shaft clockwise and counter-clockwise



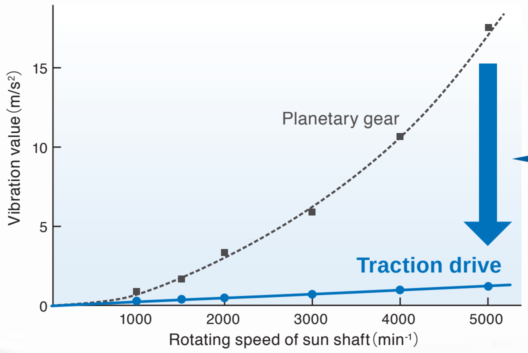
3 Noise



Gear noise eliminated!



4 Vibration



Vibration reduced by approx. 90%

Precision Ball & Roller Bearings for Machine Tools

CAT. NO. B2005E-3

Catalog
Precision Ball & Roller Bearings for Machine Tools Preface

Thank you for your valuable support of **KOYO** products.

Nowadays, there is a pressing demand in the industrial world for sophisticating machine tools in all aspects.
Accordingly, ball & roller bearings for machine tools must be more compact and lightweight and exhibit such features as longer service life, higher performance, and higher reliability. This is made possible only through a wide range of high technologies.

We are confident that this catalog will be of help to the user in the design of machine tools and in the use of precision rolling bearings.

JTEKT continually offers the best technologies, quality, and services, through inspiration from the market and putting efforts into research and technical developments.
We hope that you will be as satisfied with our products and services as you have been in the past.

☆The contents of this catalog are subject to change without prior notice.
Every possible effort has been made to ensure that the data listed in this catalogue is correct.
However, we can not assume responsibility for any errors or omissions.

Precision Ball & Roller Bearings

Technical Descriptions

1. Types and structures of precision ball & roller bearings for machine tools

Table 1. 1(1) Types and structures of precision ball & roller bearings for machine tools

1 Spindle bearings

Bearing types	Cross-sections	Bearing series		Contact angles	Features and descriptions	Page No.
 Angular contact ball bearings		Standard types	79C 70C 72C	15°	· Some bearing series support contact angle of 40° (B).	58
			70 72	30°		
	High Ability   Both-side sealed type	High-speed types	HAR9C HAR0C	15°	· Improvements in high-speed performance are made through the use of balls that have a smaller diameter than standard bearing balls. Also, a large number of balls contributes to higher rigidity. · Rolling elements are available in steel and in ceramic. · Consult JTEKT, as the HAR000 series can correspond to the non-contact seal.	
			HAR9CA HAR0CA	20°		
			HAR9 HAR0	30°		
	High Ability 		3NCHAC9C 3NCHAC0C	15°	· Large-diameter balls enable high load-carrying capacity.	
			3NCHAC9CA 3NCHAC0CA	20°	· Ceramic balls realize excellent high-speed performance.	
	High Ability 	Ultrahigh-speed types	3NCHAD0CA	20°	· These bearings have holes for oil / air lubrication. They are suitable for ultrahigh-speed applications. · Ceramic balls realize excellent high-speed performance.	
	High Ability NX series 	Extremely ultrahigh-speed types	3NCHAX9CA 3NCHAX0CA	20°	· This type of bearing produces less heat and has better high-speed performance than conventional High Ability Series products.	
 NN-type double row cylindrical roller bearings		Standard types	NN30 NN30K	—	· Bearings with tapered bores (K) are also available for applications using tapered shafts. · For radial internal clearance values, use non-interchangeable bearings. · Bearings provided with a lubrication hole or groove on the outer ring are also available (W)	104
 NNU-type double row cylindrical roller bearings			NNU49 NNU49K			
 N-type single row cylindrical roller bearings			N10 N10K	—	· Bearings with tapered bores (K) are also available for applications using tapered shafts. · For radial internal clearance values, use non-interchangeable bearings. · This type of bearing produces less heat and has better high-speed performance than double row cylindrical roller bearings.	
	High Ability NX series 	Ultrahigh-speed types	HAN10B HAN10BK	—	· This type of bearing produces less heat and has better high-speed performance than conventional single-row cylindrical roller bearings.	

Table 1. 1(2) Types and structures of precision ball & roller bearings for machine tools

Bearing types	Cross-sections	Bearing series	Contact angles	Features and descriptions	Page No.
 Double-direction angular contact thrust ball bearings		2344B	60°	· Placed on the small tapered-bore diameter side of NN30K, or used together with NN30.	120
		2347B		· Placed on the large tapered-bore diameter side of NN30K.	
		2394B	60°	· Placed on the small tapered-bore diameter side of NNU49K, or used together with NNU49.	
		2397B		· Placed on the large tapered-bore diameter side of NNU49K.	
 High-speed pair-mounted angular contact ball bearings		ACT0DB	30°	· High-speed bearings of the same bore and outside diameters as double-direction angular contact thrust ball bearings 2344B. · They are placed on the small tapered-bore diameter side of NN30K.	
		ACT0BDB	40°		
 Tapered roller bearings		329JR 320JR 302JR 322JR	Nominal contact angles: greater than 10° and equal to or less than 17°	· Metric series single row tapered roller bearings complying with ISO standards.	138

2 Support bearings and support bearing units for precision ball screws

Bearing types	Cross-sections	Bearing series	Contact angles	Features and descriptions	Page No.
 Support bearings for precision ball screws	  Both-side sealed type  Matching example of one-side sealed type	SAC	60°	· Standard preloads are specified, respectively, for 2-, 3-, and 4-row matched bearings. · Flush-ground G-type bearings are also available. · The support bearing for precision ball screws can correspond to the type with contact-seal. Consult JTEKT if desiring information about the type with seal and the matching method.	152
 Support bearing units for precision ball screws		BSU	(60°)	· Support bearing units consist of a support bearing for precision ball screws (SAC) and a precision housing. · Fitting this bearing unit is very simple.	

2. Selection of bearings

In order to select the optimum bearing to realize the intended design of a machine, it is necessary to consider specific operating conditions of the machine, bearing requirements, designs of parts around the bearing, marketability, and cost performance.

Table 2. 1 specifies the general procedure for selecting a bearing, and operating conditions to be taken into consideration. Note, however, that when selecting a bearing, priority should be given to meeting the most critical requirement rather than following a given procedure.

Table 2. 1 Procedure for selecting bearings and operating conditions to be taken into consideration

Selection procedure	Operating condition to be taken into consideration	Related information on bearings	Page No.
① Bearing types and arrangements	· Installation space · Magnitude, direction, and types of load applied to bearings · Rotational speeds · Running accuracy · Noise/frictional torque · Rigidity · Method of mounting and dismounting · Bearing arrangements · Marketability and cost performance	· Bearing types · Bearing arrangement examples	15 16
② Bearing dimensions	· Dimensions of bearing mounting positions · Dynamic equivalent load and rating life · Rotational speeds	· Bearing rating life · Basic dynamic load ratings · Dynamic equivalent loads · Permissible axial loads	18 18 24 28
③ Bearing tolerance class	· Running accuracy (runout) · Noise/frictional torque · Rotational speeds	· Bearing tolerances (Dimension tables)	
④ Fitting and internal clearance	· Loading condition · Operational temperature distribution · Shaft and housing materials · Dimensions and tolerances } · Fitting · Temperature differences between inner ring and outer ring · Rotational speed · Amount of preload	· Recommended fitting · Running accuracy of shafts and housings · Bearing preload · Internal clearance of bearings (Dimension tables)	32 39 29
⑤ Type and material of cage	· Rotational speeds · Noise · Lubrication methods		
⑥ Lubrication method, lubricant, and sealing device	· Operating temperatures · Rotational speeds · Sealing device · Lubrication methods · Lubricants	· Limiting speeds of bearings · Lubrication of bearings	34 35
⑦ Method of mounting and dismounting, and mounting dimensions	· Method of mounting and dismounting	· Handling of bearings	172
Decision on final specifications of bearing and parts around bearing			

For more information about specifications, fill out the supplementary **table 7 "Specification report of bearing for main shaft of machine tool"** on page 204, and contact **JTEKT**.

3. Selection of bearing types

When selecting a bearing type, it is of critical importance to fully understand the operating conditions of the bearing.

Table 3. 1 shows principal items to be considered and how to select a bearing type.

Table 3. 1 Selection of bearing types

Items to be considered	How to select a type
① Installation space Bearing can be installed in target equipment	· When designing a shaft system, critical factors on the whole are shaft rigidity and strength, therefore, shaft diameter, namely, the bore diameter of the bearing is determined first. · The installation space determined by types and the dimension series of the bearings used for the spindles of machine tools are shown in **Fig. 3. 1**. Select the optimum bearing from the types illustrated.
② Load Load magnitude, type and direciton which applied The load capacity of the bearing is expressed in terms of the basic load rating, the value of which is given in the bearing dimension tables.	· Select the optimum bearing type taking into consideration the magnitude of the load applied to the bearing, whether the load is axial or radial, whether, in the case of axial load, the load is unidirectional or bidirectional, the level of vibration and shock, and other relevant factors. · Radial load capacity varies as shown below with the bore diameter remaining the same. (Small) → (Large) Angular contact ball bearings Cylindrical roller bearings Tapered roller bearings
③ Rotational speeds Bearing types compatible with the machine's operating speed Standard values for rotational speed limits of bearings are expressed in limiting speed given in the bearing dimension tables.	· Limiting speeds of bearings largely depends not only on the bearing type, but also on other factors such as bearing size, running accuracy, type and materials of the cage, magnitude of load, and lubrication. Select a bearing taking these fully into consideration. · In general, angular contact ball bearings and cylindrical roller bearings are often used for high-speed applications.
④ Running accuracy Bearing types meeting requirements for running accuracy Dimension and running accuracies are standardized by JIS and the like for each bearing type.	· The spindles of machine tools, which need to rotate with high accuracy, require precision bearings meeting tolerance class 5 or better. · In general, angular contact ball bearings and cylindrical roller bearings are used.
⑤ Rigidity Bearing types meeting the rigidity requirements for machine shaft systems When a load is applied to a bearing, elastic deformation occurs at the contacts between the raceway and rolling elements.The smaller the elastic deformation, the higher the rigidity.	· In order to improve the machining precision of a machine tool, the rigidity of bearings as well as the rigidity of the shaft should be improved. · In general, roller bearings exhibit a high rigidity, while ball bearings exhibit low rigidity. Bearings of the same type and dimensions vary in rigidity with the number of rolling elements and contact angle. · The rigidity of a bearing is increased by applying a preload to the bearing (to provide a clearance of a negative value). This method is suitable for angular contact ball bearings and tapered roller bearings.
⑥ Mounting and dismounting Bearing types should be selected taking into consideration the frequency and method of mounting and dismounting on occasions such as periodic inspection	· If the bearing is to be mounted and dismounted frequently, cylindrical roller bearings and tapered roller bearings are advantageous, as the inner ring and outer ring are separable.

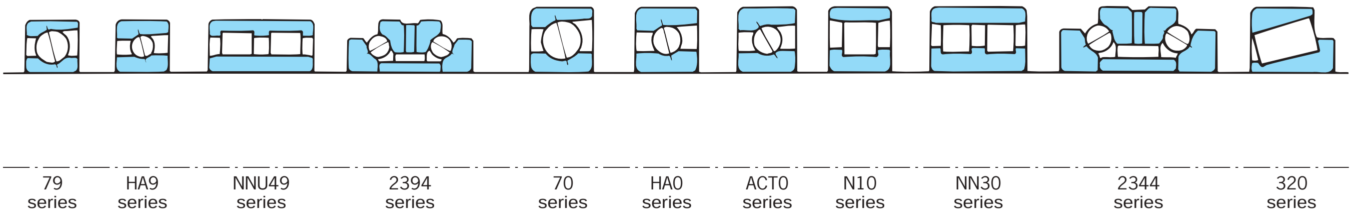

Fig. 3. 1 Installation space determined by types and dimension series of precision rolling bearings for machine tools

4. Spindle bearing arrangements

Fig. 4. 1 presents typical arrangements for spindle bearings for machine tools.

For high-speed spindles, the use of ceramic bearings enables higher speed.

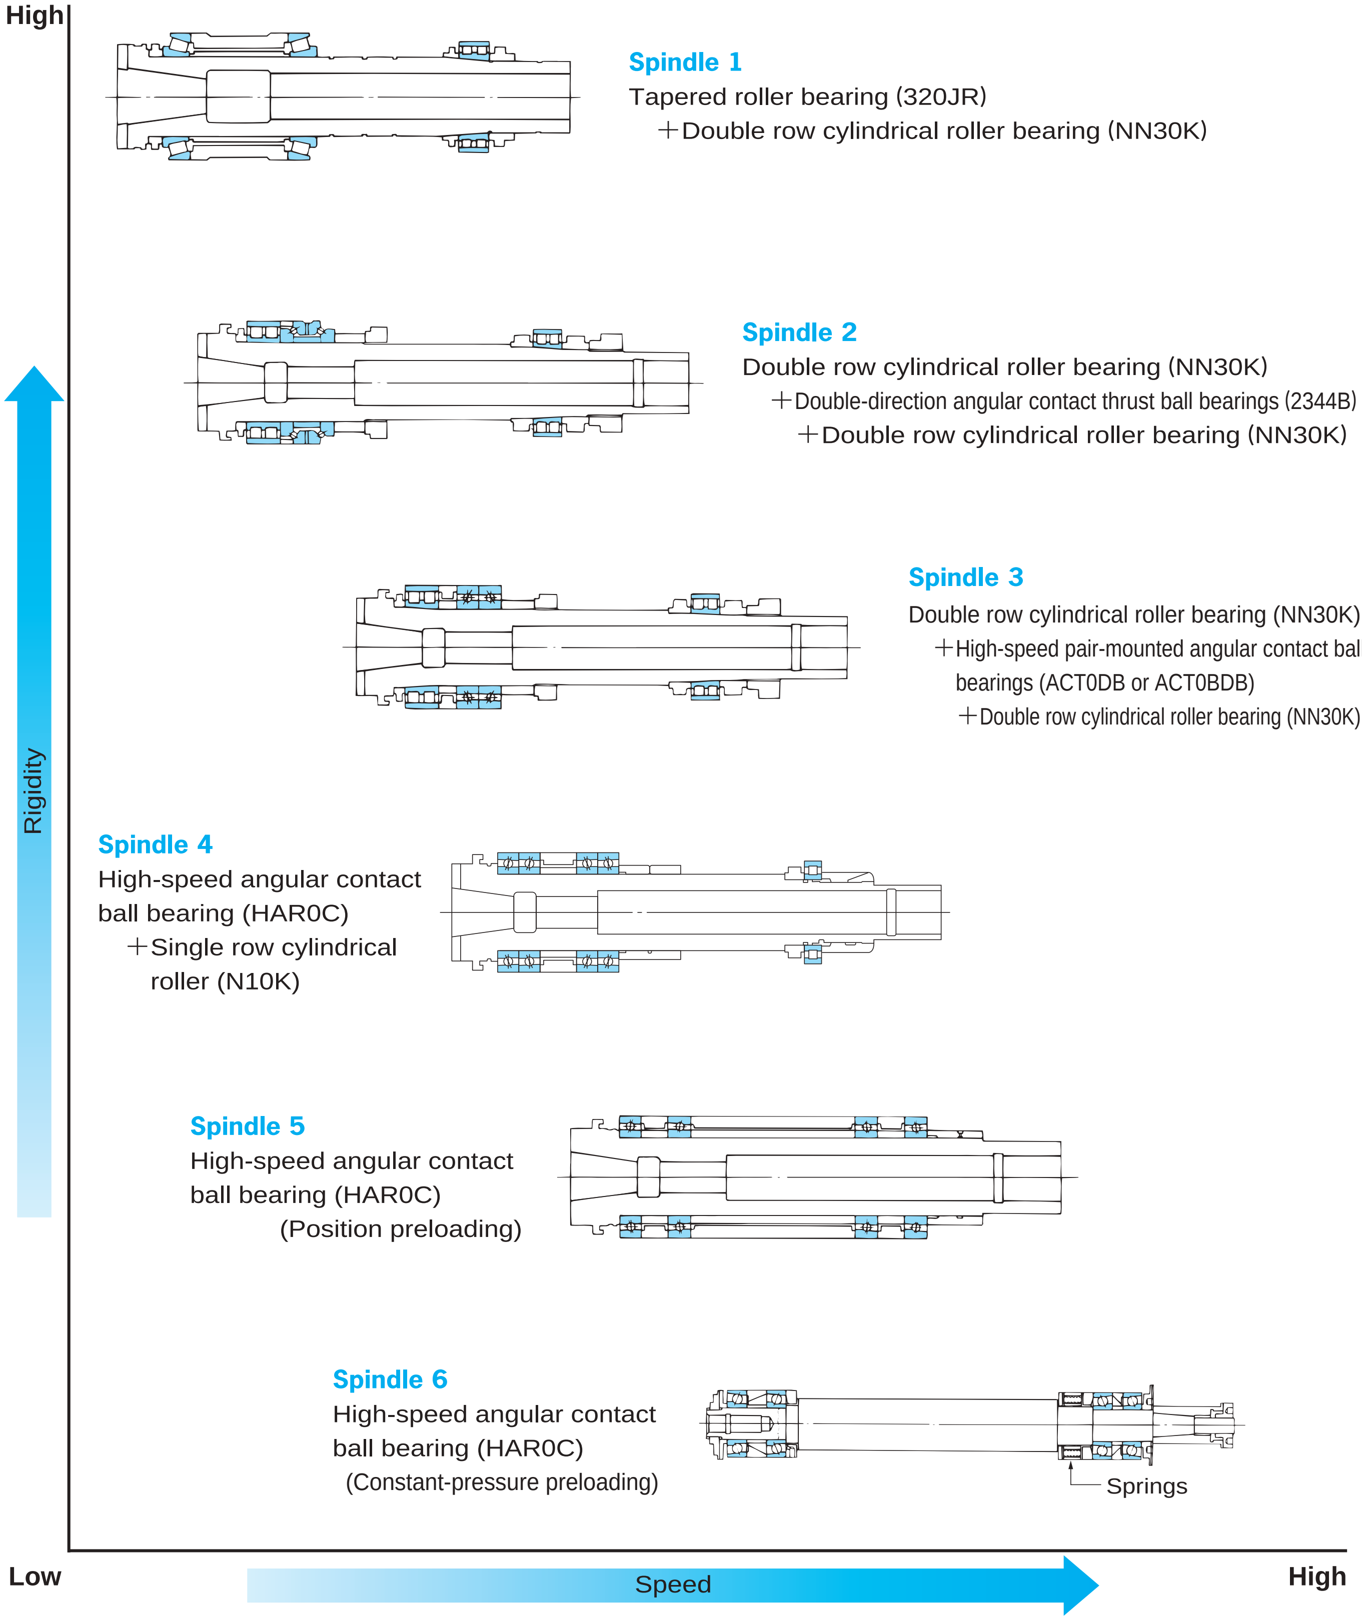

Fig. 4. 1 Examples of spindle bearing arrangements

Table 4. 1 Detailed examples of spindle bearing arrangements

(The d_mn value represents the product of the pitch diameter of ball set d_m and the rotational speed n.)

Spindle	d_mn Value	Features	Principal applications
1	Grease lubrication: 0.2×10^6	Both radial and axial loads are accepted by the tapered roller bearing. This arrangement produces high rigidity but is not suitable for high-speed operation.	Large lathes General-purpose lathes Milling machines
2	Grease lubrication: 0.4×10^6	In this structure, radial load is accepted by a double row cylindrical roller bearing and axial load is accepted by a double-direction angular contact thrust ball bearing. This arrangement produces high rigidity.	CNC lathes Machining centers Boring machines Milling machines
3	Grease lubrication: 0.5×10^6	A high-speed matched pair angular contact ball bearing is used instead of the double-direction angular contact thrust ball bearing in Spindle 2. Contact angles of the high-speed pair-mounted angular contact ball bearings are 30° for ACT0DB and 40° for ACT0BDB.	CNC lathes Machining centers Milling machines
4	Grease lubrication: 0.7×10^6 Oil / air lubrication: 1.05×10^6	Both radial and axial loads are accepted by the angular contact ball bearing. This arrangement is superior to Spindle 3 in high-speed performance, but inferior in radial and axial rigidity.	CNC lathes Machining centers Milling machines
5	Grease lubrication: 0.85×10^6 Oil / air lubrication: 1.1×10^6	High-speed angular contact ball bearings are used in both the front and rear to provide greater high-speed performance. Factors such as thermal expansion should be taken into consideration for preload settings.	Boring machines Machining centers
6	Grease lubrication: 1.0×10^6 Oil / air lubrication: 1.45×10^6	Constant-pressure preloading is used to prevent increase in preload due to heat. This arrangement produces a lower rigidity than that produced by position preloading, but is superior in high-speed performance.	Grinding machines

5. Service life of bearings

5. 1 Rating life of bearings

When a bearing rotates under a load, the surfaces of the inner and outer ring raceways and the surfaces of the rolling elements are constantly subjected to repetitive loads. Even under proper operating conditions this results in scale-like damage (known as flaking) of the surfaces due to fatigue.

The total number of rotations before this damage occurs is known as "(fatigue) service life" of the bearing.

A substantial variation in "(fatigue) service life" occurs even if bearings of the same structure, dimensions, materials, machining method, etc. are operated under the same conditions.

This variation in fatigue, an intrinsic phenomenon to the material, should be examined statistically.

The total number of rotations at which 90% of the same type of bearings individually operated under the same conditions are free of damage caused by rolling fatigue (in other words, service life of 90% reliability), is referred to as "basic rating life of the bearing."

In some cases, however, bearings, when actually mounted and operated on a machine, may become inoperative due to causes other than damage by fatigue (wear, seizure, creep, fretting, brinelling, cracking, etc.).

By giving sufficient consideration to the selection of bearings, installation, lubrication, and the like, it is possible to avoid such causes.

5. 2 Service life calculation of bearings

5. 2. 1 Basic dynamic load ratings

The strength of a bearing against rolling fatigue—that is, the basic dynamic load rating representing the bearing load capacity—is the net radial load (in the case of a radial bearing) or central axial load (in the case of a thrust bearing) such that its magnitude and direction are constant and the bearing can attain a basic rating life of 1 million rotations under the condition that the inner ring rotates while the outer ring is stationary (or vice versa).

These are called "basic dynamic radial load rating (C_r)" or "basic dynamic axial load rating (C_a)," respectively. Values for these items are given in the bearing dimension tables.

5. 2. 2 Basic rating life

The relationship among the basic dynamic load rating, the dynamic equivalent load, and the basic rating life is expressed by equation (5. 1).

If a bearing is to be operated at a constant rotational speed, its service life is conveniently expressed in hours as determined by equation (5. 2).

(Total number of rotations)

$$L_{10}=\left(\frac{C}{P}\right)^{p} \quad \cdots\cdots\cdots\cdots (5.\ 1)$$

(Hours)

$$L_{10\mathrm{h}}=\frac{10^{6}}{60n}\left(\frac{C}{P}\right)^{p} \quad \cdots\cdots\cdots\cdots (5.\ 2)$$

where,

L_{10} : basic rating life 10^6 rotations

$L_{10\mathrm{h}}$: basic rating life h

P : dynamic equivalent load N

C : basic dynamic load rating N

n : rotational speed min^{-1}

p : $p=3$ for ball bearings

$p=10/3$ for roller bearings

When a bearing is operated with a dynamic equivalent load of P and a rotational speed of n, the basic dynamic load rating C of the bearing, which is suitable for meeting the design service life, is given by equation (5. 3). Thus the bearing dimensions are determined by selecting a bearing from the bearing dimension tables, which meets requirement C.

$$C=P\left(L_{10\mathrm{h}}\times\frac{60n}{10^{6}}\right)^{1/p} \quad \cdots\cdots\cdots\cdots (5.\ 3)$$

[Reference] A method for determining the rating life of a bearing in a simplified method

A formula for determining service life, in which a service life coefficient (f_h) and speed coefficient (f_n) are applied in equation (5. 2), is shown below.

$$L_{10h}=500\,f_h^{\,p} \quad \cdots\cdots (5.\ 4)$$

Service life coefficient :

$$f_h=f_n\frac{C}{P} \quad \cdots\cdots (5.\ 5)$$

Speed coefficient :

$$f_n=\left(\frac{10^6}{500\times 60\,n}\right)^{1/p}$$

$$=(0.03\,n)^{-1/p} \cdots\cdots (5.\ 6)$$

Values of f_n, f_h, and L_{10h} are approximated by the nomograms shown in **Fig. 5. 1**.

How to use nomograms

■ Operating conditions (example)

· Cylindrical roller bearing

NN3014K $C=96.9$ kN

· Rotational speed

$n=7\,000$ min^{-1}

· Dynamic equivalent load

$P=4.9$ kN

① Speed coefficient :

Since $n=7\,000$

f_n reads: $f_n=0.2$

② Service life coefficient :

f_h is obtained as follows.

$$f_h=f_n\frac{C}{P}=0.2\times\frac{96.9}{4.9}=3.96$$

③ Rating life :

Since $f_h=3.96$,

L_{10h} is: $L_{10h}=49\,000$

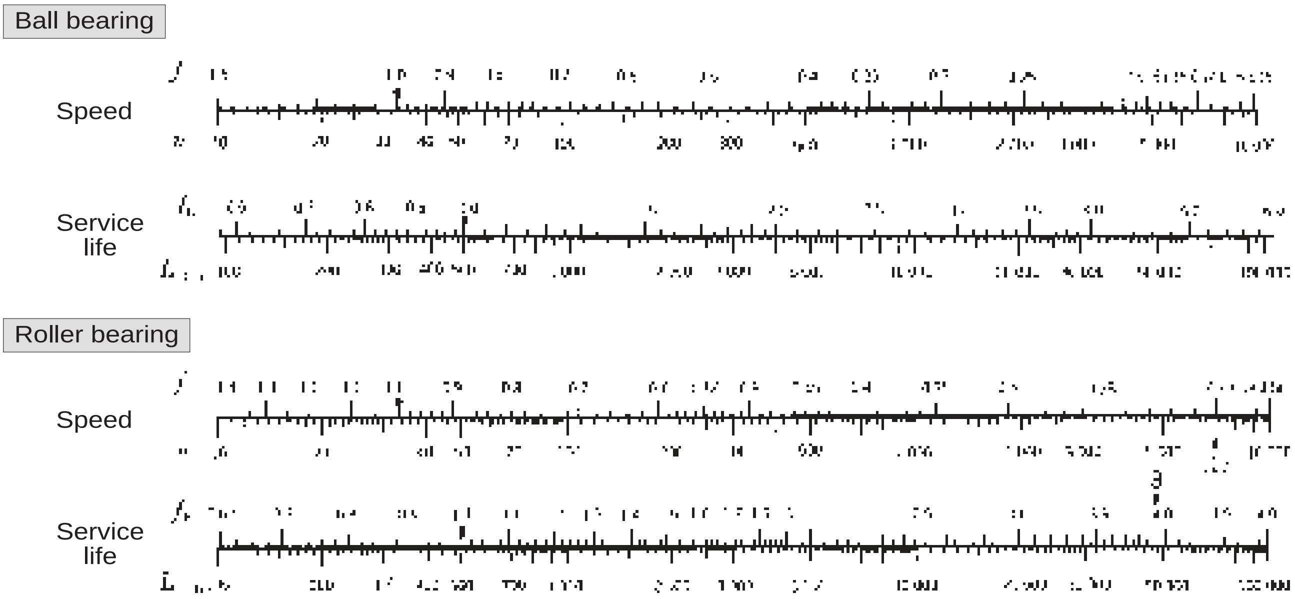

Fig. 5. 1 Rotational speed (n) vs. speed coefficient (f_n) and service life coefficient (f_h) vs. service life (L_{10h})

5. 2. 3 Modified rating life L_{nm}

The life of rolling bearings was standardized as a basic rating life in the 1960s, but in actual applications, sometimes the actual life and the basic rating life have been quite different due to the lubrication status and the influence of the usage environment. To make the calculated life closer to the actual life, a corrected rating life has been considered since the 1980s. In this corrected rating life, bearing characteristic factor a_2 (a correction factor for the case in which the characteristics related to the life are changed due to the bearing materials, manufacturing process, and design) and usage condition factor a_3 (a correction factor that takes into account usage conditions that have a direct influence on the bearing life, such as the lubrication) or factor a_{23} formed from the interdependence of these two factors, are considered with the basic rating life. These factors were handled differently by each bearing manufacturer, but they have been standardized as a modified rating life in **ISO 281** in 2007. In 2013, **JIS B 1518** (dynamic load ratings and rating life) was amended to conform to the ISO.

The basic rating life (L_{10}) shown in equation (5. 1) is the (fatigue) life with a dependability of 90% under normal usage conditions for rolling bearings that have standard factors such as internal design, materials, and manufacturing quality. **JIS B 1518**:2013 specifies a calculation method based on **ISO 281**:2007. To calculate accurate bearing life under a variety of operating conditions, it is necessary to consider elements such as the effect of changes in factors that can be anticipated when using different reliabilities and system approaches, and interactions between factors. Therefore, the specified calculation method considers additional stress due to the lubrication status, lubricant contamination, and fatigue load limit C_u (refer to **2)** b) on the inside of the bearing. The life that uses this life modification factor a_{ISO}, which considers the above factors, is called modified rating life L_{nm} and is calculated with the following equation (5. 7).

$$L_{nm}=a_1\, a_{ISO}\, L_{10} \quad \cdots\cdots\cdots\cdots\cdots\cdots(5.\ 7)$$

In this equation,

L_{nm} : Modified rating life 10^6 rotations

This rating life has been modified for one of or a combination of the following: reliability of 90% or higher, fatigue load limit, special bearing characteristics, lubrication contamination, and special operating conditions.

L_{10} : Basic rating life 10^6 rotations (reliability: 90%)

a_1 : Life modification factor for reliability ··························refer to section **1)**

a_{ISO} : Life modification factor ··························refer to section **2)**

[Remark] When bearing dimensions are to be selected given L_{nm} greater than 90% in reliability, the strength of shaft and housing must be considered.

1) Life modification factor for reliability a_1

The term "reliability" is defined as "for a group of apparently identical rolling bearings, operating under the same conditions, the percentage of the group that is expected to attain or exceed a specified life" in **ISO 281**:2007. Values of a_1 used to calculate a modified rating life with a reliability of 90% or higher (a failure probability of 10% or less) are shown in **Table 5. 1**.

Table 5. 1 Life modification factor for reliability a_1

Reliability, %	L_{nm}	a_1
90	L_{10m}	1
95	L_{5m}	0.64
96	L_{4m}	0.55
97	L_{3m}	0.47
98	L_{2m}	0.37
99	L_{1m}	0.25
99.2	$L_{0.8m}$	0.22
99.4	$L_{0.6m}$	0.19
99.6	$L_{0.4m}$	0.16
99.8	$L_{0.2m}$	0.12
99.9	$L_{0.1m}$	0.093
99.92	$L_{0.08m}$	0.087
99.94	$L_{0.06m}$	0.080
99.95	$L_{0.05m}$	0.077

(**Table 5. 1** Citation from **JIS B 1518**:2013)

2) Life modification factor a_{ISO}

a) System approach

The various influences on bearing life are dependent on each other. The system approach of calculating the modified life has been evaluated as a practical method for determining life modification factor a_{ISO} (ref. **Fig. 5. 2**). Life modification factor a_{ISO} is calculated with the following equation. A diagram is available for each bearing type (radial ball bearings, radial roller bearings, thrust ball bearings, and thrust roller bearings). (Each diagram (**Figs. 5. 3** to **5. 6**) is a citation from **JIS B 1518**:2013.)

Note that in practical use, this is set so that life modification factor $a_{ISO} \leqq 50$.

$$a_{ISO}=f\left(\frac{e_c\,C_u}{P},\ \kappa\right) \quad \cdots\cdots\cdots\cdots\cdots(5.\ 8)$$

b) Fatigue load limit C_u

For regulated steel materials or alloy steel that has equivalent quality, the fatigue life is unlimited so long as the load condition does not exceed a certain value and so long as the lubrication conditions, lubrication cleanliness class, and other operating conditions are favorable. For general high-quality materials and bearings with high manufacturing quality, the fatigue stress limit is reached at a contact stress of approximately 1.5 GPa between the raceway and rolling elements. If one or both of the material quality and manufacturing quality are low, the fatigue stress limit will also be low.

The term "fatigue load limit" C_u is defined as "bearing load under which the fatigue stress limit is just reached in the most heavily loaded raceway contact" in **ISO 281**:2007. and is affected by factors such as the bearing type, size, and material.

For details on the fatigue load limits of special bearings and other bearings not listed in this catalog, contact JTEKT.

c) Contamination factor e_c

If solid particles in the contaminated lubricant are caught between the raceway and the rolling elements, indentations may form on one or both of the raceway and the rolling elements. These indentations will lead to localized increases in stress, which will decrease the life. This decrease in life attributable to the contamination of the lubricant can be calculated from the contamination level as contamination factor e_c.

D_{pw} shown in this table is the pitch diameter of ball/roller set, which is expressed simply as $D_{pw}=(D+d)/2$. (D: Outside diameter, d: Bore diameter)

For information such as details on special lubricating conditions or detailed investigations, contact JTEKT.

Table 5. 2 Values of contamination factor e_c

Contamination level	e_c	
	D_{pw}<100 mm	D_{pw}≧100 mm
Extremely high cleanliness: The size of the particles is approximately equal to the thickness of the lubricant oil film, this is found in laboratory-level environments.	1	1
High cleanliness: The oil has been filtered by an extremely fine filter, this is found with standard grease-packed bearings and sealed bearings.	0.8 to 0.6	0.9 to 0.8
Standard cleanliness: The oil has been filtered by a fine filter, this is found with standard grease-packed bearings and shielded bearings.	0.6 to 0.5	0.8 to 0.6
Minimal contamination: The lubricant is slightly contaminated.	0.5 to 0.3	0.6 to 0.4
Normal contamination: This is found when no seal is used and a coarse filter is used in an environment in which wear debris and particles from the surrounding area penetrate into the lubricant.	0.3 to 0.1	0.4 to 0.2
High contamination: This is found when the surrounding environment is considerably contaminated and the bearing sealing is insufficient.	0.1 to 0	0.1 to 0
Extremely high contamination	0	0

(**Table 5. 2** Citation from **JIS B 1518**:2013)

d) Viscosity ratio κ

The lubricant forms an oil film on the roller contact surface, which separates the raceway and the rolling elements. The status of the lubricant oil film is expressed by viscosity ratio κ , the actual kinematic viscosity at the operating temperature ν divided by the reference kinematic viscosity ν_1 as shown in the following equation.

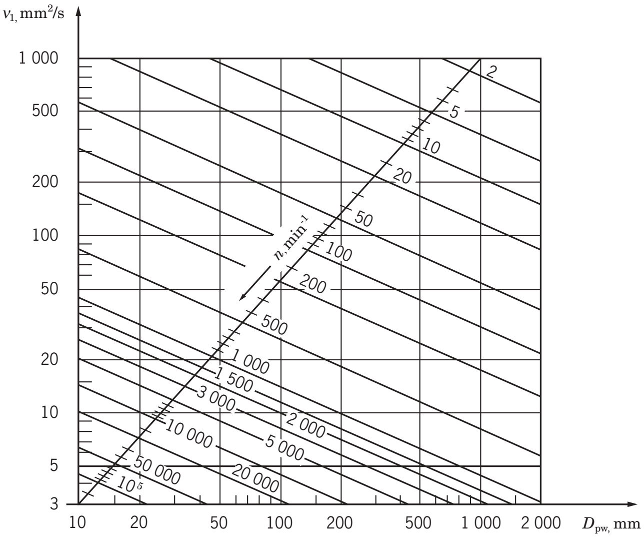
A κ greater than 4, equal to 4, or less than 0.1 is not applicable.

For details on lubricants such as grease and lubricants with extreme pressure additives, contact JTEKT.

$$\kappa = \frac{\nu}{\nu_1} \quad \cdots\cdots(5.\ 9)$$

ν : Actual kinematic viscosity at the operating temperature; the viscosity of the lubricant at the operating temperature

ν_1 : Reference kinematic viscosity; determined according to the speed and pitch diameter of ball/roller set D_{pw} of the bearing (ref. **Fig. 5. 7**)



(**Fig. 5. 7** Citation from **JIS B 1518**:2013)

Fig. 5. 7 Reference kinematic viscosity ν_1

5. 2. 4 Service life of bearing system comprising two or more bearings

Even for systems which comprise two or more bearings, if one bearing is damaged, the entire system malfunctions.

Where all bearings used in an application are regarded as one system, the service life of the bearing system can be calculated using the following equation.

$$\frac{1}{L^e} = \frac{1}{L_1^{\,e}} + \frac{1}{L_2^{\,e}} + \frac{1}{L_3^{\,e}} + \cdots\cdots\cdots\cdots\cdots \text{(5. 10)}$$

where :

L : rating life of system

L_1 , L_2 , L_3 ··· : rating life of each bearing

e: constant e=10/9 ······ball bearing
e= 9/8 ······roller bearing
The mean value is for a system using both ball and roller bearings.

[Example]

When a shaft is supported by two roller bearings whose service lives are 50 000 hours and 30 000 hours respectively, the rating life of the bearing system supporting this shaft is calculated as follows, using equation (5. 10) :

$$\frac{1}{L^{9/8}} = \frac{1}{50\ 000^{9/8}} + \frac{1}{30\ 000^{9/8}}$$

$L \fallingdotseq 20\ 000$ h

The equation suggests that the rating life of these bearings as a system becomes shorter than that of the bearing with the shorter life.

This fact is very important in estimating bearing service life for applications using two or more bearings.

5. 3 Dynamic equivalent loads

Bearings are used under different conditions. For example, they are often subjected to a resultant load consisting of radial and axial loads, the magnitudes of which may vary.

Consequently, it is not possible to directly compare the actual load that a bearing receives and the basic dynamic load rating.

In such a case, a calculation is carried out for comparison and examination, in which a load having a constant magnitude and direction, is applied to the bearing center such that it would make the service life of the bearing the same as that resulting from the actual load and rotational speed.

This theoretical load is known as the dynamic equivalent load (P).

5. 3. 1 Calculation of dynamic equivalent load

The dynamic equivalent loads of a radial bearing and a thrust bearing ($\alpha \neq 90°$) receiving a resultant load constant in magnitude and direction is obtained as illustrated below.

$$P=XF_r+YF_a \quad \cdots\cdots\cdots\cdots (5.\,11)$$

---

where,

P : dynamic equivalent load N

(For radial bearings, "P_r : dynamic equivalent radial load" and for thrust bearings, "P_a : dynamic equivalent axial load," respectively, are used.)

F_r : radial load N

F_a : axial load N

X : radial load coefficient

Y : axial load coefficient

(Values of X and Y are noted in the bearing dimension tables.)

---

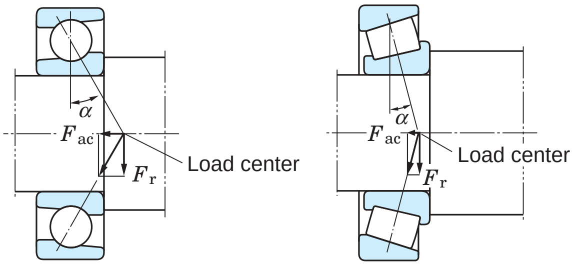
1) If $F_a/F_r \leqq e$ for a single row radial bearing, $X=1$ and $Y=0$ are used.
Hence, the dynamic equivalent load will be $P_r=F_r$.

(e denotes the limit of F_a/F_r, whose values are listed in the bearing dimension tables.)

2) Application of a radial load to a single row angular contact ball bearing, or tapered roller bearing, produces a component of force (F_{ac}) in the axial direction (**Fig. 5. 8**).
Therefore, a pair of bearings are usually used to arrange face-to-face or back-to-back.

The component of force in the axial direction is determined by the following equation.

$$F_{ac}=\frac{F_r}{2Y} \quad \cdots\cdots\cdots\cdots (5.\,12)$$



(Dimensions representing the position of load center are noted in the bearing dimension tables.)

Fig. 5. 8 Components of force in axial direction

Table 5. 3 (page 25) shows ways of determining the dynamic equivalent load where a radial load and external axial load (K_a) are applied to these bearings.

Table 5. 3　Calculations of dynamic equivalent loads for two opposing single row angular contact ball bearings or tapered roller bearings

Bearing arrangement		Loading condition	Bearing	Axial load	Dynamic equivalent load
Back-to-back	**Face-to-face**				
		$\frac{F_{rB}}{2Y_B}+K_a \geqq \frac{F_{rA}}{2Y_A}$	Bearing A	$\frac{F_{rB}}{2Y_B}+K_a$	$P_A=XF_{rA}+Y_A\left(\frac{F_{rB}}{2Y_B}+K_a\right)$ Note that $P_A=F_{rA}$ if $P_A<F_{rA}$
			Bearing B	—	$P_B=F_{rB}$
		$\frac{F_{rB}}{2Y_B}+K_a < \frac{F_{rA}}{2Y_A}$	Bearing A	—	$P_A=F_{rA}$
			Bearing B	$\frac{F_{rA}}{2Y_A}-K_a$	$P_B=XF_{rB}+Y_B\left(\frac{F_{rA}}{2Y_A}-K_a\right)$ Note that $P_B=F_{rB}$ if $P_B<F_{rB}$
		$\frac{F_{rB}}{2Y_B} \leqq \frac{F_{rA}}{2Y_A}+K_a$	Bearing A	—	$P_A=F_{rA}$
			Bearing B	$\frac{F_{rA}}{2Y_A}+K_a$	$P_B=XF_{rB}+Y_B\left(\frac{F_{rA}}{2Y_A}+K_a\right)$ Note that $P_B=F_{rB}$ if $P_B<F_{rB}$
		$\frac{F_{rB}}{2Y_B} > \frac{F_{rA}}{2Y_A}+K_a$	Bearing A	$\frac{F_{rB}}{2Y_B}-K_a$	$P_A=XF_{rA}+Y_A\left(\frac{F_{rB}}{2Y_B}-K_a\right)$ Note that $P_A=F_{rA}$ if $P_A<F_{rA}$
			Bearing B	—	$P_B=F_{rB}$

[Remarks] 1. These calculations are applicable where during operation the internal clearance and preload are 0 (zero).
2. Radial loads are assumed to be positive even if they are applied in the opposite direction of the arrows shown above.

5. 3. 2 Mean dynamic equivalent loads for variable loads

When a load, applied to a bearing, varies in magnitude and direction, it is necessary to obtain a mean dynamic equivalent load that may result in the same service life as would result under actual variation conditions.

Ways of determining the mean dynamic equivalent load P_m suitable for different variation conditions are shown in **Table 5. 4**, **(1)** to **(4)**.

In the case when a stationary load and a rotational load are applied simultaneously, as shown in **(5)**, the mean dynamic equivalent load is given by equation (5. 17).

Table 5. 4 Ways of determining mean dynamic equivalent loads from variable loads

(1) Stepwise variation	**(2) Simple variation**	**(3) Sine like curve variation**
		$P_m = \sqrt[p]{\dfrac{P_1^p n_1 t_1 + P_2^p n_2 t_2 + \cdots\cdots + P_n^p n_n t_n}{n_1 t_1 + n_2 t_2 + \cdots\cdots + n_n t_n}}$ …… (5. 13)	$P_m = \dfrac{P_{min} + 2P_{max}}{3}$ …… (5. 14)	$P_m = 0.68 P_{max}$ …… (5. 15)

(4) **Sine like curve variation** (**Upper portion of a sine curve**)	**(5)** **Stationary and rotational loads being applied at the same time**
	$P_m = 0.75 P_{max}$ …… (5. 16)	$P_m = f_m(P + P_u)$ …… (5. 17)

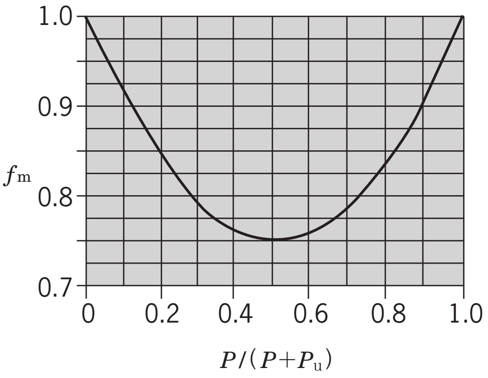


Fig. 5. 9 f_m Coefficient

- In **(1)** to **(4)** in **Table 5. 4**:

P_{m} : mean dynamic equivalent load N
P_1 : dynamic equivalent load applied at a rotational speed of n_1 for t_1 hours N
P_2 : dynamic equivalent load applied at a rotational speed of n_2 for t_2 hours N
$\vdots$ $\vdots$ $\vdots$
P_{n} : dynamic equivalent load applied at a rotational speed of n_n for t_n hours N
$P_{\min}$: minimum dynamic equivalent load N
$P_{\max}$: maximum dynamic equivalent load N
$\Sigma n_i t_i$: total number of rotations in a period from t_1 to t_i
p : $p=3$ for ball bearings
$p=10/3$ for roller bearings

(Reference) The mean rotational speed n_{m} is obtained by the following equation.

$$n_{\mathrm{m}}=\frac{n_1t_1+n_2t_2+\cdots\cdots+n_{\mathrm{n}}t_{\mathrm{n}}}{t_1+t_2+\cdots\cdots+t_{\mathrm{n}}}$$

- In **(5)** in **Table 5. 4**:

P_{m} : mean dynamic equivalent load N
f_{m} : coefficient (see **Fig. 5. 9**)
P : stationary load N
P_{u} : rotational load N

5. 4 Basic static load rating and static equivalent load

5. 4. 1 Basic static load rating

Excessive static load or impact load even at very low rotation causes partial permanent deformation of the rolling element and raceway contacting surfaces. This permanent deformation increases with the load; if it exceeds a certain limit, smooth rotation will be hindered.

The basic static load rating is the static load which responds to the calculated contact stress shown below, at the contact center between the raceway and rolling elements which receive the maximum load.

- Self-aligning ball bearings ··· 4 600 MPa
- Other ball bearings ··············· 4 200 MPa
- Roller bearings ······················ 4 000 MPa

The total extent of contact stress-caused permanent deformation on surfaces of rolling elements and raceway will be approximately 0.000 1 times greater than the rolling element diameter.

The basic static load rating for radial bearings is specified as the basic static radial load rating, and for thrust bearings, as the basic static axial load rating. These load ratings are listed in the bearing specification table, using $C_{0\mathrm{r}}$ and $C_{0\mathrm{a}}$ respectively.

These values are prescribed by ISO 78/1987 and are subject to change by conformance to the latest ISO standards.

5. 4. 2 Static equivalent load

The static equivalent load is a theoretical load calculated such that, during rotation at very low speed or when bearings are stationary, the same contact stress as that imposed under actual loading condition is generated at the contact center between raceway and rolling element to which the maximum load is applied.

For radial bearings, radial load passing through the bearing center is used for the calculation; for thrust bearings, axial load in a direction along the bearing axis is used.

The static equivalent load can be calculated using the following equations.

[Radial bearings]

···The greater value obtained by the following two equations is used.

$$P_{0\mathrm{r}}=X_0F_{\mathrm{r}}+Y_0F_{\mathrm{a}} \quad\cdots\cdots\cdots\cdots \quad (5.\ 18)$$

$$P_{0\mathrm{r}}=F_{\mathrm{r}} \quad\cdots\cdots\cdots\cdots \quad (5.\ 19)$$

[Thrust bearings]

($\alpha\neq90°$)

$$P_{0\mathrm{a}}=X_0F_{\mathrm{r}}+F_{\mathrm{a}} \quad\cdots\cdots\cdots\cdots \quad (5.\ 20)$$

[When $F_{\mathrm{a}}<X_0F_{\mathrm{r}}$, the solution becomes less accurate.]

($\alpha=90°$)

$$P_{0\mathrm{a}}=F_{\mathrm{a}} \quad\cdots\cdots\cdots\cdots \quad (5.\ 21)$$

---

where,

$P_{0\mathrm{r}}$: static equivalent radial load N
$P_{0\mathrm{a}}$: static equivalent axial load N
F_{r} : radial load N
F_{a} : axial load N
X_0 : static radial load factor
Y_0 : static axial load factor

(values of X_0 and Y_0 are listed in the bearing specification table.)

5. 4. 3 Safety coefficient

The allowable static equivalent load for a bearing is determined by the basic static load rating of the bearing; however, bearing service life, which is affected by permanent deformation, differs in accordance with the performance required of the bearing and operating conditions.

Therefore, a safety coefficient is designated, based on empirical data, so as to ensure safety in relation to basic static load rating.

$$f_s = \frac{C_0}{P_0} \cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots (5.\ 22)$$

where,

f_s : safety coefficient (ref. **Table 5. 5**)

C_0 : basic static load rating N

P_0 : static equivalent load N

Table 5. 5 Values of safety coefficient f_s

Operating condition		f_s (min.)	
		Ball bearing	**Roller bearing**
With bearing rotation	When high accuracy is required	2	3
	Normal operation	1	1.5
	When impact load is applied	1.5	3
Without bearing rotation (occasional oscillation)	Normal operation	0.5	1
	When impact load or uneven distribution load is applied	1	2

[Remark] For spherical thrust roller bearings, $f_s \geqq 4$.

5. 5 Service life of greases

The previous section explained the fatigue service life of bearings. Spindle bearings for machine tools, however, rarely have a problem of bearing service life caused by load.

When grease lubrication is used, ineffective lubrication may occasionally occur, resulting in bearing failures. It is therefore necessary to give sufficient consideration to selecting the brand and the amount of grease to be used, for given operating conditions.

Refer to "**8. Lubrication of bearings**" for grease lubrication.

5. 6 Permissible axial loads

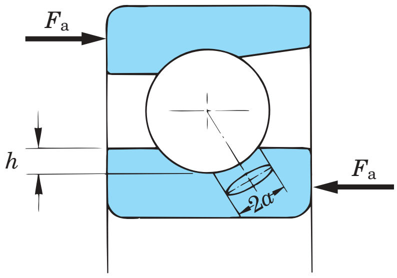
A large axial load may be applied to the bearings for main shafts of machine tools when, for example, tools are changed.

Application of a large axial load to an angular contact ball bearing may cause the contact ellipse formed between the ball and raceway surface to deviate beyond the raceway surface (see **Fig. 5. 10**).

Furthermore, if the stress becomes excessive, the rolling elements and raceway surface may sustain permanent deformation (nicks), possibly resulting in increased runout or vibration.

The smaller one of the following values is defined as the permissible axial load (static). And the permissible axial load (static) for each bearing is shown in the dimension list of the bearings.

- The load generated when the end of the contact ellipse formed between the ball and the raceway reaches the shoulder of the inner or outer ring.
- The load generated when the pressure of the contact surface between the ball and the raceway reaches the standard value calculated based on the actual results.



where,

h : bearing shoulder height

a : half length of the contact ellipses' major axis

F_a : axial load

Fig. 5. 10 Contact ellipse

6. Rigidity and preload of bearings

6. 1 Rigidity of bearings

The rigidity of a bearing has a considerable influence on the rigidity of the spindle of the machine tool. The rigidity of a bearing can be improved by the following methods.

① Roller bearings, in which line contact is made between the raceway surface and the rolling element, are used when a high radial rigidity is required.

② In the case where high axial rigidity is required, stack mounting angular contact ball bearings, are generally used.

Furthermore, bearings with a large contact angle are used.

③ For high-speed and high-rigidity requirements, it is effective to reduce the diameter and increase the number of rolling elements.

It is also possible to improve the rigidity of a bearing by using ceramics (silicon nitride) for the rolling elements which is superior in Young's modulus.

Bearings having ceramic rolling elements also offer improved high-speed performance since their density is lower than that of bearing steel, yielding a small centrifugal force even under high-speed rotation.

④ Apply a preload to the bearing.

6. 2 Preload of bearings

Preloading means setting the inner clearance to be a negative value and loading the bearing after mounting it.

In case of the angular contact ball bearing and tapered roller bearing, an axial load is applied when preloading. And in case of the cylindrical roller bearing, a radial load is applied when preloading.

6. 2. 1 Objective of preload

■ To improve rigidity

■ To improve the positioning accuracy in the radial and axial directions, and to improve the running accuracy as well, by minimizing the runout of the shaft

■ To reduce smearing by controlling whirl slip, orbital slip, and rotational slip of rolling elements in high-speed rotations

■ To prevent noise caused by vibration and resonance

6. 2. 2 Methods for preloading

There are two major methods for preloading the angular contact ball bearing and tapered roller bearing; position preloading and constant-pressure preloading.

In the position preloading method, the bearing and spacer, whose dimensions are adjusted to the specified values beforehand, are used. In the constant-pressure preloading method, coil springs or disk springs are used to preload the bearing.

Usage examples and comparison of these methods are shown in **Fig. 6. 1**.

Also, these preloading methods can be switched over when rotating, and the amount of the preload (load) can be gradually changed in accordance with the speed of the rotation.

Table 6. 1 Methods for preloading

Position preloading			Constant-pressure preloading
When applying the same preload, the displacement to load is smaller and the rigidity is higher than when using the constant-pressure preloading method. When rotating at high speed, the use of this method is limited because the preload amount varies depending on the mounting conditions, centrifugal force and temperature rise.			This method is applicable when rotating at high speed because there is less preload variation when rotating than when using the position preloading method, and almost constant preload can be maintained. However, the improvement of the rigidity of the shaft is not as good as when using the position preloading method.
			① A method using matched pair bearings with the preload adjusted.  	② A method using a spacer of preadjusted size.	③ A method using a nut or bolt capable of adjusting the amount of preload in the axial direction. (In this case, confirm that the appropriate preload is applied while measuring the starting torque, etc. This method is not suitable for conditions which require high precision, because the bearing tends to tilt easily. In these conditions, methods 1) and 2) are recommended.)	A method using coil springs or disk springs to apply preload. When using the coil springs, place them on the circumference at regular intervals so that the pressure is applied equally.

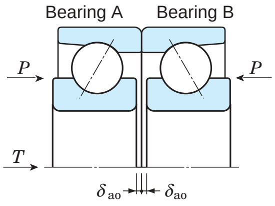
6. 2. 3 Preload and axial rigidity

Fig. 6. 1 shows the relationship between preload (position preload) and rigidity, namely, axial displacement of a back-to-back arrangement bearing.

Applying a preload P (by tightening the inner ring in the axial direction), as shown in **Fig. 6. 1**, results in bearings A and B respectively being displaced by δ_{ao}. The clearance between the inner rings $2\delta_{ao}$ will then become 0 (zero).

When an external axial load T is applied to these bearings, their resultant displacement as a pair-mounted bearing set can be obtained as δ_a.

P : amount of preload
T : external axial load
T_A : axial load applied to bearing A
T_B : axial load applied to bearing B
δ_a : displacement of pair-mounted bearing set
δ_{aA} : displacement of bearing A
δ_{aB} : displacement of bearing B
$2\delta_{aO}$: clearance between inner rings before applying preload



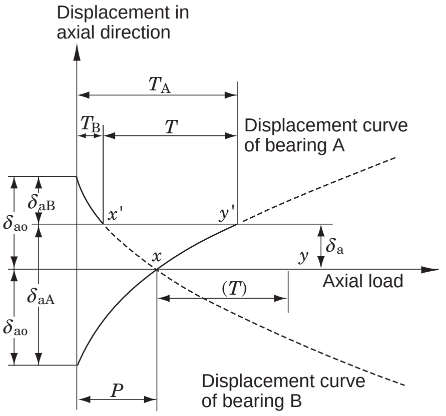


Fig. 6. 1 Preload diagram for position preloading

[Reference] How to determine δ_a in Fig. 6. 1

① Obtain the displacement curve of bearing A.
② Obtain the displacement curve of bearing B: this is the curve symmetrical with respect to the transverse axis and the intersection x at the preload P.
③ Assuming an external load T, obtain a line x–y on the transverse axis passing through x. By parallel displacement of line x–y along the displacement curve of bearing B, the intersection y' passing through the displacement curve of bearing A is obtained.
④ δ_a is determined as the distance between the lines x'–y' and x–y.

Fig. 6. 2 shows the relationship between preload and rigidity when a constant-pressure preload is applied to the same pair-mounted bearing as shown in **Fig. 6. 1**.

Since the rigidity of the spring is negligible in this case, the rigidity of the bearing is approximately equal to that of a single bearing given a preload P.

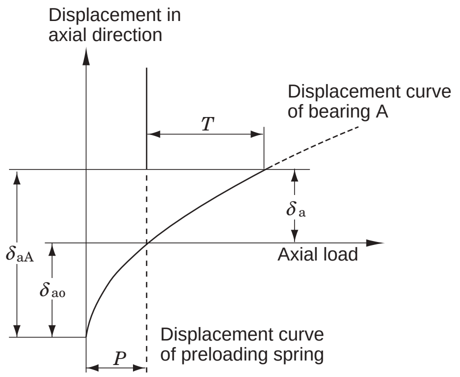

Fig. 6. 2 Preload diagram of constant-pressure preloading

Comparison of axial rigidity of the position preloading and the constant-pressure preloading is shown in **Fig. 6. 3**.

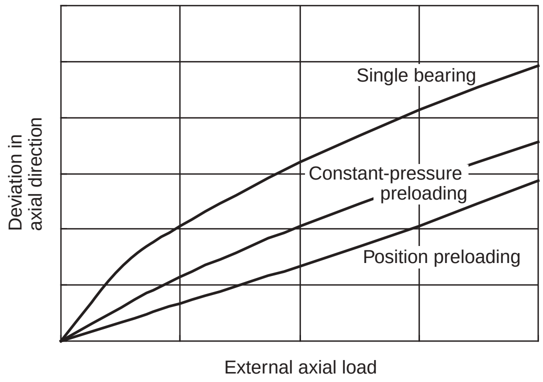

Fig. 6. 3 Comparison of axial rigidity

6. 2. 4 Amount of preload

If the amount of preload to the bearing is increased, the rigidity is improved.

However, as the load is applied to the bearing, the life may become shorter and abnormal heat may be generated, resulting in serious failure, including early damage, seizure, etc.

Also, in case of position preloading, the amount of preload varies depending on the mounting conditions, including fitting of the bearing, the centrifugal force generated during the operation and the temperature rise.

6. 2. 5 Variation of position preloading due to fitting and rotation

1) Preload in mounting the bearing

The angular contact ball bearing is shown as a model in **Fig. 6. 4a**.

In case of the bearing for the main shaft of a machine tool, for which the inner ring is usually rotated, the interference fit is employed for the inner ring, and the clearance fit is employed for the outer ring. However, the diameter of the inner ring raceway will expand due to interference, and the axial clearance changes as shown in **Fig. 6. 4b**, resulting in the increase in the amount of preload.

Furthermore, if the inner ring is tightened by the shaft nut, etc., the width of the inner ring and the spacer will shrink, resulting in increase in preload.

This is the preload generated when the bearing is mounted.

2) Change of preload during rotation

During rotation, the preload is changed by centrifugal force and temperature rise.

When rotating, the inner ring is affected by the centrifugal force and the raceway expands. Due to this expansion, the preload increases as shown in **Fig. 6. 4c**.

Influence of temperature rise is described below.

When rotating, the temperature of the bearing increases and the components expand because of rotation resistance, stirring resistance generated by the lubricant, and other external factors.

The temperature increase of the inner ring and the rolling elements is larger than that of the outer ring, which radiates heat easily. Therefore, the internal clearance changes because of the expansion as shown in **Fig. 6. 4d**, and the preload is increased.

Also, the temperature difference is generated between the outer ring and the housing, and the outer ring becomes hotter than the housing, reducing the clearance of the fitting surface of the outer ring. If the clearance of the fitting surface of the outer ring is too small, the fitting of the outer ring becomes interference fitting because of the temperature difference, and the internal clearance changes due to the shrinkage of the raceway of the outer ring, increasing the preload as shown in **Fig. 6. 4e**.

As a result, it is also important to take into consideration the case where the housing cools off excessively.

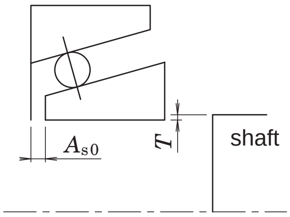

Fig. 6. 4a Bearing before mounting

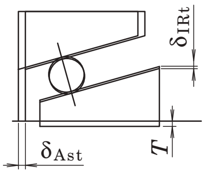

Fig. 6. 4b Change of dimension due to inner ring interference

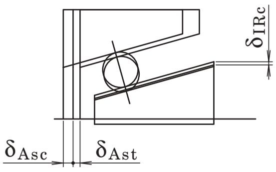

Fig. 6. 4c Change of dimension due to centrifugal expansion of inner ring raceway

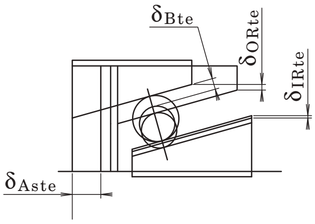

Fig. 6. 4d Change of dimension due to heat expansion

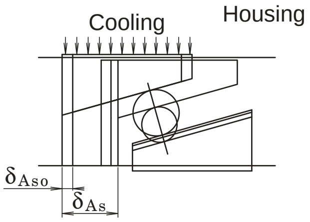

Fig. 6. 4e Change of dimension due to shrinkage of outer ring raceway

A_{s0} : initial stand-out value (The sum of the stand-out value of a pair of bearings is the size of the clearance for which the preload is provided.)
T : interference of inner ring
δ_{IRt} : expansion of inner ring raceway due to inner ring interference
δ_{Ast} : change of bearing stand-out value due to inner ring interference
δ_{IRc} : centrifugal expansion of inner ring raceway
δ_{Asc} : change of bearing stand-out value due to centrifugal expansion of inner ring raceway
δ_{IRte} : heat expansion of inner ring raceway
δ_{ORte} : heat expansion of outer ring raceway
δ_{Bte} : heat expansion of rolling element
δ_{Aste} : change of bearing stand-out value due to temperature rise of each component
δ_{Aso} : change of bearing stand-out value due to shrinkage of outer ring raceway
δ_{As} : total of change of stand-out value due to mounting conditions and rotation

6. 2. 6 Selecting preload and fitting

To maintain the initial performance of the bearing and use it in stable condition, it is necessary to select an ideal preloading method and preload amount considering the use conditions as well as the mounting conditions.

Especially, when using the bearing at high speed, it is indispensable to select an ideal preload, taking into consideration the preload change, the pressure between the raceway and the rolling elements generated by centrifugal force, and the factors which cause spin slide of the angular contact ball bearing.

The standard preload amount of each bearing is shown in the table of bearing dimensions. Also, the interferences of the bearings for main shafts in standard use condition are shown in **Figs. 6. 2** and **6. 3**.

Consult JTEKT for detailed information about preloads and fittings when using the bearings at high speed with value $d_m n$ set at 80×10^4 or more or with a heavy load of $C_r/P_r<13$.

[Remark] Consult **JTEKT** for specific operating conditions (high-speed rotation, outer ring rotation, heavy load, etc.).

7. Limiting speeds of bearings

The rotational speed of a bearing is restricted chiefly by temperature increases caused by frictional heat generated within the bearing. When a speed limit is reached, it becomes impossible to continue operation due to seizure and the like.

The permissible rotational speed of a bearing represents the value of limiting speed at which the bearing can continue operation without cousing seizure-generated temperatures.

Accordingly, the limiting speed differs with bearing types, dimensions, accuracy, lubrication methods, quality and quantity of lubricant, shape and material of cages, loading conditions (including amount of preload), etc.

The limiting speed for grease lubrication or oil (oil / air) lubrication of bearings are given in their dimension tables.

These values are the limiting speed that are applicable where a bearing of a standard design is operated under normal loading conditions ($C_r/P_r \geqq 13$, $F_a/F_r \leqq$approx. 0.2).

C_r : basic dynamic load rating
P_r : dynamic equivalent load
F_r : radial load
F_a : axial load

Spindle bearings for machine tools are used in one of 2-, 3-, or 4-row combinations. The limiting speed of a stack mounting bearing is lower than that of a single row bearing.

The speed coefficients are shown in **Table 7. 1**. In this table, the correlations between the preload amounts and the matching methods of the bearings mounted to the shafts with position preloading are shown. Differences are made due to the heat radiation and the variation in the preload amount of each bearing.

Where a lubricant can efficiently remove the heat generated in the bearing, the limiting speed of a bearing will be greater than those given in the bearing dimension tables.

If the rotational speed of a bearing exceeds 80% of the value listed in the bearing dimension tables, careful consideration should be given to the amount of preload, lubrication method, lubricant, distance between the bearings, etc. Consult JTEKT.

Table 7. 1　Speed coefficients

Matching method	Prefix	Preload in mounting			
		Preload S	Preload L	Preload M	Preload H
	DB	0.85	0.80	0.65	0.55
	DBB	0.80	0.75	0.60	0.45
	DBD	0.75	0.70	0.55	0.40

* The speed coefficients vary depending on the distance between the bearings.

8. Lubrication

Lubrication is a critical issue for bearings, on which their performance greatly depends.
The suitability of a lubricant and lubrication method has great influence on the performance of a bearing.

Lubrication plays the following roles.

- Lubrication of each part of the bearing reduces wear and friction.
- Removes heat in the bearing generated by friction and other causes.
- Extends the service life of bearings by constantly forming an adequate oil film on the rolling contact surfaces.
- Rust prevention and dust proofing for bearings

Lubrication is very important for spindle bearings of machine tools since such bearings require a low temperature increase under high-speed operation.

Relationships between the quantity of lubricant and power loss and between the quantity of lubricant and the temperature increase of the bearing are shown in **Fig. 8. 1**. Relationships between the viscosity of lubricant and power loss and between the viscosity of lubricant and the temperature increase of the bearing are shown in **Fig. 8. 2**.

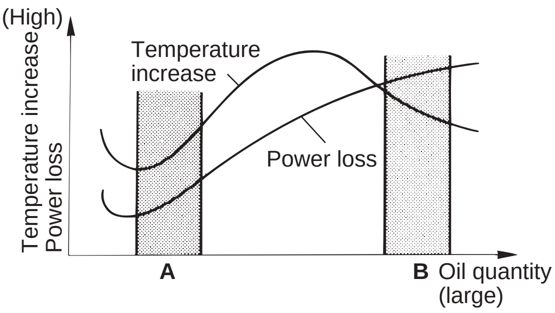

Fig. 8. 1 Relationships between lubricant quantity and power loss and between lubricant quantity and the temperature increase of the bearing

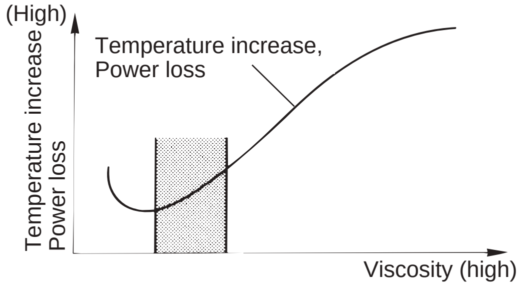

Fig. 8. 2 Relationships between viscosity of lubricant and power loss and between viscosity of lubricant and the temperature increase of the bearing

The quantity of lubricant needed to meet the low temperature increase requirement lies in zone A where the quantity of oil is small so the agitation loss is low, and zone B in which a large quantity of oil transfers heat from the bearing to the outside. Regarding the viscosity of lubricant, those which are of relatively low viscosity are suitable for meeting the above-mentioned requirement.

Note, however, that an excessively small quantity of oil or excessively low viscosity will not maintain a suitable lubricant film during operation, and further induce the chances of seizure.

For bearing lubrication methods, grease, oil / air, or oil mist lubrication is recommended in zone A in **Fig. 8. 1**, and jet lubrication, in zone B.

Table 8. 1 shows a comparison of features for various lubrication methods. It is important to select a lubrication method and a lubricant to best suit to the machine specifications.

Table 8. 1 Comparison of features of different lubrication methods

○ : advantageous
△ : somewhat disadvantageous
× : disadvantageous

Lubrication method Item	Grease lubrication	Oil / air lubrication	Oil mist lubrication	Jet lubrication

Temperature increase of bearing	△	○	△	○
High-speed reliability	×	○	△	○
Power loss	○	○	○	×
Volume occupied by lubricator	○	△	△	×
Environmental contamination	○	△	×	△
Service life of lubricant	×	○	○	○

8. 1 Grease lubrication

Grease lubrication is most usually employed because it requires no special lubricator and the use of a relatively simple housing structure is sufficient.

However, to meet machine tool bearing requirements (high-speed operation, low temperature increase, and long service life of sealed grease), the following should be taken into consideration.

8. 1. 1 Types of grease

In order to meet the low level temperature increase requirement of a bearings during operation, a grease low in base oil viscosity is suitable.

In general, grease NLGI 2 in consistency and approximately 10-30 mm^2/s in base oil viscosity is often used for spindle bearings of machine tools. In cases where bearings are subjected to high loads, a grease with a base oil viscosity of approximately 100 mm^2/s, and an extreme-pressure agent may be used to secure lubricant film during operation.

Table 8. 2 shows grease for spindle bearings of machine tools.

8. 1. 2 Sealing device

For spindle bearings of machine tools, it is important to use a reliable sealing device to prevent mixing of coolant, chips, wear particle of drive belt, gear lubricant, and so forth.

Where grease lubrication is adopted, foreign matter have a great influence on the service life of a bearing.

An example of sealing device for grease lubrication is shown in **Fig. 8. 3**.

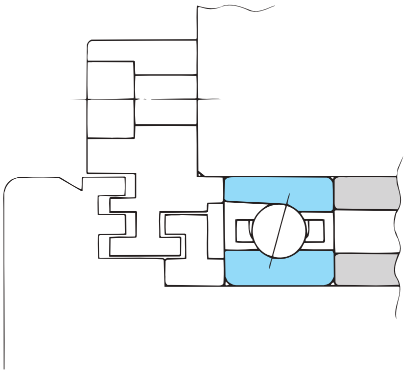

Fig. 8. 3 Example of sealing device for grease lubrication (labyrinth seal)

Table 8. 2 Grease for spindle bearings of machine tools (representative examples)

8. 2 Oil lubrication

8. 2. 1 Oil / air lubrication

In this lubrication method, a small amount of oil of a specified quantity is supplied intermittently to each bearing by compressed air.

A schematic drawing of an oil / air lubrication system is shown in **Fig. 8. 4**.

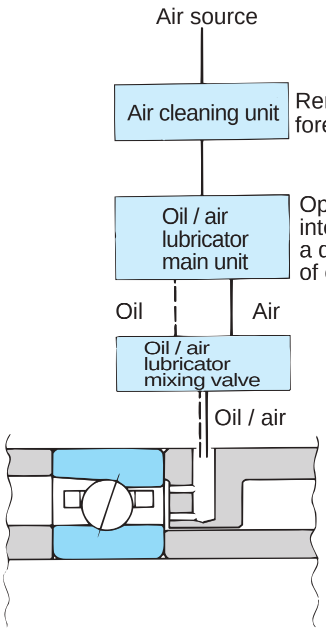

Fig. 8. 4 Oil / air lubrication system

Since oil / air lubrication has features as shown below, it has become popular in many high-speed spindle.

1. Compared with grease lubrication, oil / air lubrication allows bearings to meet the low temperature increase and high-speed operation requirements (see **Fig. 8. 5**).

   This lubrication method eliminates concerns about the service life of lubricant as new oil is constantly supplied to the bearings. Furthermore, compressed air, which increases the pressure in the housing, is effective in preventing foreign matter from entering into the housing.

2. Compared with oil mist lubrication, oil / air lubrication is simple to adjust the quantity of oil with a high degree of accuracy. This leads to a high reliability for bearings during high-speed operation.

   In addition, unlike oil mist lubrication, oil / air lubrication is free from environmental contamination and also reduces oil consumption.

3. Compared with jet lubrication, oil / air lubrication suppresses power losses of bearings (see **Fig. 8. 6**).

   This feature saves space because a smaller drive motor and cooling unit can be used.

   The structure of the main shaft can also be simple and compact.

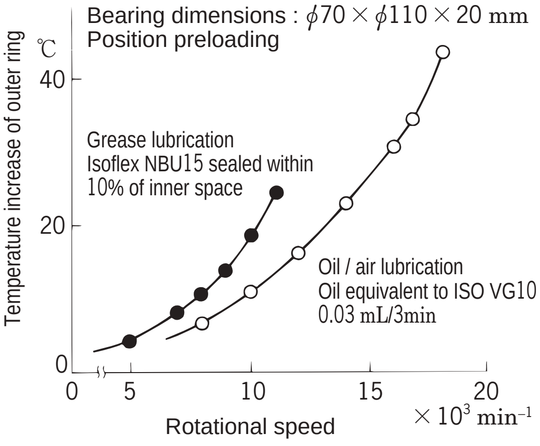

Fig. 8. 5 Comparison of the temperature increase between oil / air lubrication and grease lubrication

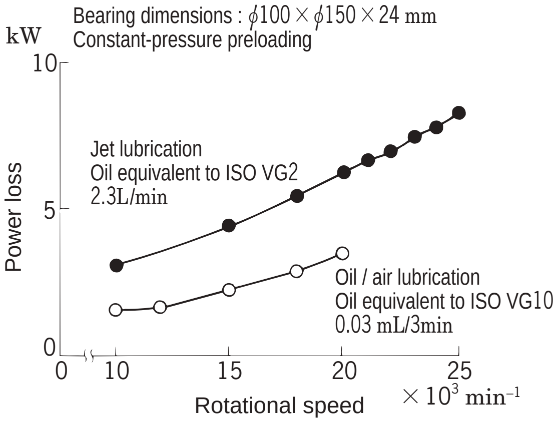

Fig. 8. 6 Comparison of power loss between oil / air lubrication and jet lubrication

In order to take advantage of oil / air lubrication features, **JTEKT** has produced oil / air lubricators and air cleaning units, of which we have special knowhow and have shipped to many customers.

Consult **JTEKT** for the appliation of the oil / air lubrication systems.

For details of the oil / air lubricator and air cleaning unit, see "**Ⅱ. Oil / Air Lubrication System.**"

Refer to **Table 9. 4** on page 41 for information about the dimensions of the spacers for oil / air lubrication.

Refer to **Supplementary table 6** on page 203 for information about the blow intervals of the oil / air.

8. 2. 2 Oil mist lubrication

Similar to oil / air lubrication, oil mist lubrication supplies a small quantity of oil to each bearing by compressed air.

Fig. 8. 7 shows an oil mist lubrication system.

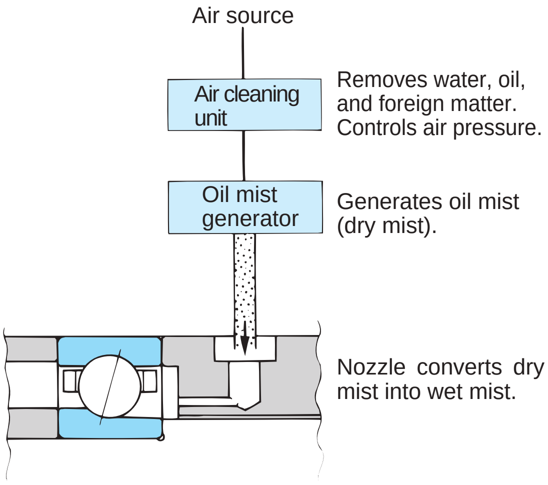

Fig. 8. 7 Oil mist lubrication system

The cost of oil mist lubrication is relatively low. The high-speed performance attained by this method is better than by grease lubrication.

To obtain maximum performance from this method, due consideration should be given to the following.

1. Oil quantity settings

The quantity of oil is set by the rate at which the oil mist generator produces oil drops. Since the rate of oil turned to mist depends on the type of oil, air pressure, flow rate, etc., it is important to determine the amount of oil drops required after the characteristics of the whole system have been sufficiently understood.

2. Distribution of mist to several bearings

In general, a single oil mist generator is used to distribute the mist to several bearings.

Each bearing should be checked to see if it is supplied with an adequate quantity of oil.

3. Installation of suitable nozzle(s)

The nozzle converts dry mist into wet mist suitable for lubrication of bearings and supplies mist to the inside of bearings.

For reliable operation, the nozzle design should be given sufficient consideration.

A well-designed nozzle reduces the quantity of oil so that contamination by oil mist will also be reduced.

8. 2. 3 Jet lubrication

Jet lubrication is a method in which a large quantity of lubricant is injected at a high velocities through the bearing side to lubricate and cool the bearing simultaneously.

Fig. 8. 8 shows a jet lubrication system.

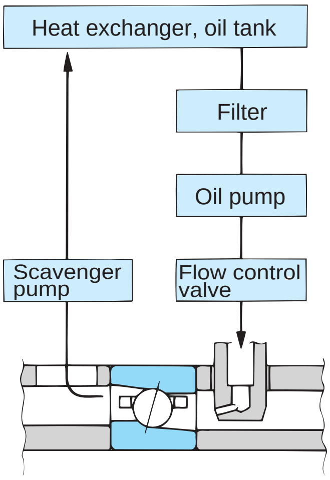

Fig. 8. 8 Jet lubrication system

Owing to its high reliability for high-speed operation, the jet lubrication is often applied to such bearings designed for high-speed and high-temperature operation, for example, gas turbine engines. Also, jet lubrication is sometimes employed for the high-speed spindles of machine tools. If this is the case, give due consideration to the following points.

1. Use oil of extremely low viscosity of approximately 2 mm^2/s to restrain power loss and temperature increase.

2. To improve cooling efficiency, set the velocity of the lubricant ejected from the nozzle to at least 20% of the peripheral speed of the outer surface of the inner ring, thereby allowing more oil to pass through the bearing.

   Installing several nozzles on the circumference for a larger quantity of oil is also effective to some degree.

3. A pump or similar device should be used to discharge oil smoothly. For this reason, the discharge port should be as large as possible to ensure a smooth discharge of oil.

   After discharge, the lubricant should be cooled with a heat exchanger of adequate capacity in order to minimize temperature changes.

   It is also essential to maintain clean lubricant by installing an appropriate filter, ensuring an airtight oil tank, and so forth.

9. Designing peripheral parts of bearings

9. 1 Tolerances of shafts and housings

When the inner and outer rings of a bearing are mounted on a shaft and a housing with a certain interference, the shapes of the shaft and housing tend to influence the raceway surface of the bearing leading to a change in running accuracy.

Therefore, shafts and housings need to be finished to maximum possible precision.

Recommended values for tolerances and surface roughness of shafts and housings are shown in **Tables 9. 1** and **9. 2**.

Refer to "**Ⅲ. Handling of Bearings**" for details about handling and mounting of the bearings.

Table 9. 1 Tolerances and surface roughness of shafts

[Remarks]
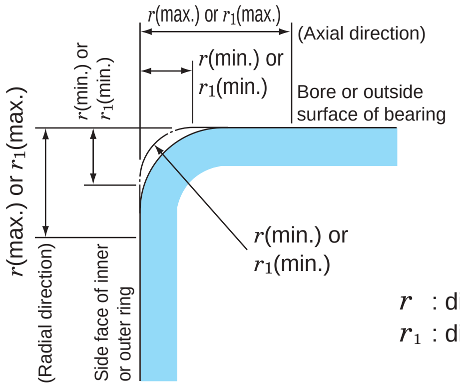
1. Tolerances, symbols, and reference planes for housings comply with ISO/R1101.
2. When determining the tolerance in relation to the permissible accuracy of shapes, the housing bore diameters D_A and D_B are used as reference dimensions.

9. 2 Limits of chamfer dimensions and fillet radii of shafts and housings



[Remark]

An imaginary arc with a radius of r (min) is defined as being tangent to both the side face of the inner ring and the bore surface of the bearing; or to both the side face of outer ring and the outside surface of the bearing. Although an exact shape is not specified for chamfered surfaces, the outline in the axial plane shall not extend beyond the imaginary arc.

r : dimension for chamfering inner and outer rings
r_1 : dimension for chamfering the front and the likes of the inner and outer rings

Table 9. 3 Limits of chamfer dimensions and fillet radii of shafts and housings

10. Heat treatment and materials technology

At JTEKT, we use our proprietary heat treatment technology to produce bearings with long service lives and a variety of cages that provide the optimal performance for specific usage applications.

This section will introduce the heat treatment and materials technology of JTEKT.

10. 1 Rings

10. 1. 1 SH bearing overview

SH bearings are bearings for which special heat treatment (SH treatment) has been applied to the inner and outer rings.

By forming a compressive residual stress layer on the ring surface (the goal of which is the improvement of the service life), we have improved the surface hardness. (See **Fig. 10. 1** and **Fig. 10. 2**.)

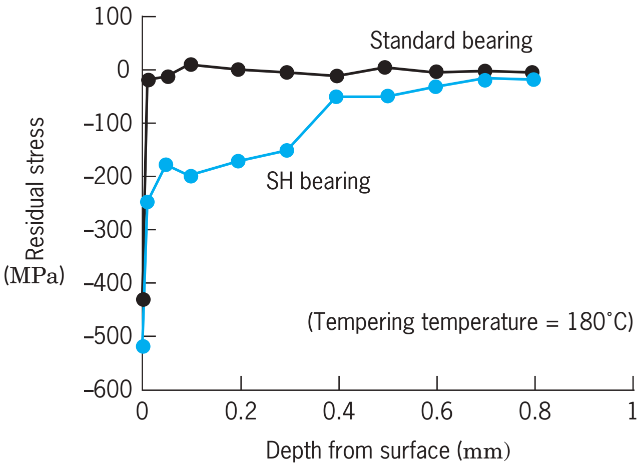

Fig. 10. 1 Compressive residual stress layer

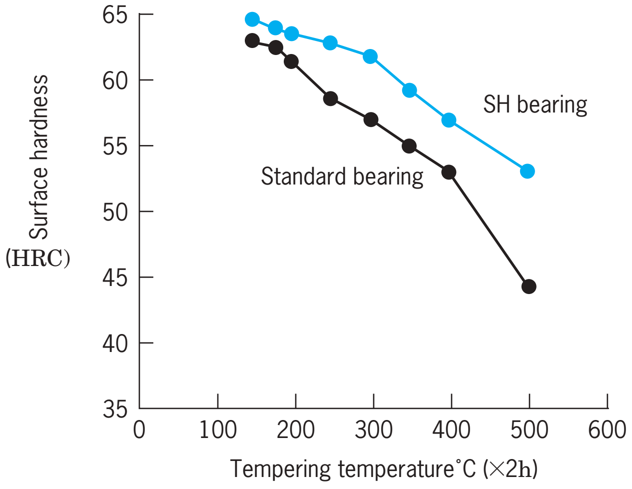

Fig. 10. 2 Surface hardness

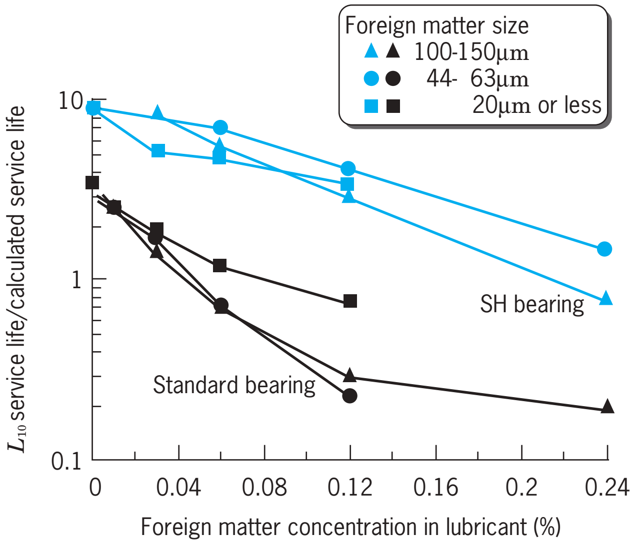
10. 1. 2 Performance

In clean oil, these bearings achieve a bearing rating life that is two or more times that of standard bearings.

(Also, in dirty oil, these bearings achieve a bearing rating life that is three or more times that of standard bearings.)

(See **Fig. 10. 3**.)



Test bearing : Ball bearing 63/22 (equivalent)
Tester : KS radial tester
Lubricant : Oil bath with turbine oil #68
Foreign matter : Bearing steel powder

Fig. 10. 3 Relationship between lubricant cleanliness and bearing service life

10. 2 Cage material

Compared to metal, engineering plastic is lighter and has better self-lubricating and wear resistance properties. When it is used in cages, it generates a small amount of heat and causes little grease degradation due to wear. Therefore, engineering plastic is widely used in precision bearings for machine tool use.

10. 2. 1 Types and features of cage materials

Material	Cage code	Features
Brass	FW·FY	Excellent heat resistance and hardness
Polyamide resin	FG	A standard thermo plastic resin with low cost and excellent wear resistance and oil resistance
Phenolic resin	FT	A cloth base material impregnated with phenolic resin; excellent heat resistance, wear resistance, and oil resistance
PEEK resin	PG	The highest level of heat resistance among all thermo plastic resins and excellent properties such as wear resistance, creep resistance, and fatigue characteristics

10. 2. 2 Scope of cage materials

Material	Angular contact ball bearings	
	Oil/air lubrication	Grease lubrication
Brass		
Polyamide resin		Ball guided
Phenolic resin	Outer ring guided	
PEEK resin	Outer ring guided	

Material	Cylindrical roller bearings	
	Oil/air lubrication	Grease lubrication
Brass	Roller guided	Roller guided
Polyamide resin	Roller guided	Roller guided
Phenolic resin		
PEEK resin	Outer ring guided	

10. 2. 3 Example evaluation of the high-speed properties of a PEEK resin cage product and a polyamide resin cage product

11. High Ability angular contact ball bearings

High Ability angular contact ball bearings are optimized for use on machine-tool spindles. They excel in high-speed performance and rapid acceleration/deceleration, and are especially superior in ultrahigh-speed applications when used with oil / air lubrication. Even with grease lubrication, these bearings are superior to conventional products in high-speed applications.

11. 1 Types and applications

High Ability angular contact bearings are available in the varieties listed in **Table 11. 1**, all of which differ in structure and rolling-element material.

Select the type that is best suited for the application.

Table 11. 1 High Ability bearing types and principal applications

Principal applications	Taype	Specification		
		Bearing dimension series	Contact angle	Material of rolling element
High-speed, high-rigidity type	Type R 	10 19	15° 20° 30°	Steel or ceramics
High-speed, high load-rating type	Type C 	10 19	15° 20°	ceramics
Ultrahigh-speed, low-noise type for oil / air lubrication	Type D 	10	20°	ceramics
Extremely ultrahigh-speed type for oil / air lubrication	Type X 	10 19	20°	ceramics

11. 2 Features

● 20 to 30% reduction in temperature increase (compared with JTEKT's conventional products)

JTEKT has conducted various tests and analyses and developed elaborate machining techniques to improve the performance of bearings used with machining tool spindles. The result is a substantial reduction in frictional heat generated in bearings rotating at a high speed.

● 1.2- to 1.5-time increases in speed limits (compared with JTEKT's conventional products)

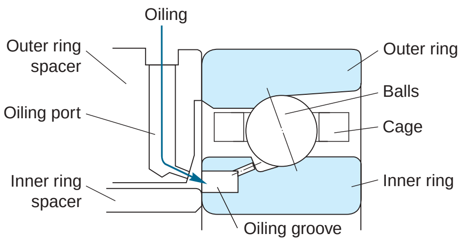
Speed limits have been extended through re-designing for high-speed rotation and heat reduction. Use of ceramic balls as rolling elements enables additional high-speed rotation.

● Improved high-speed performance achieved by position preloading

Low increases in temperature during operation ensure reduced changes in preload. Preload can be given by position preloading even at high speeds, which has been hitherto unavailable with conventional systems. The result is high-precision machining with stability.

● Conventional bearings easily replaced

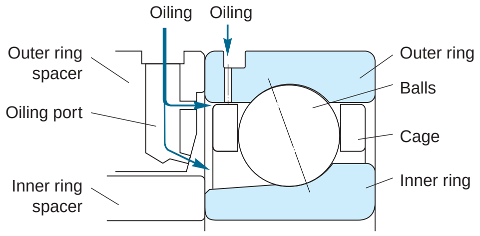
Dimensions of High Ability bearings conform to ISO standards. Replacement of conventional bearings with High Ability bearings requires minimal geometry changes of the present spindle or housing.



The oiling nozzle should be aligned with the oiling groove in the inner ring.

Fig. 11. 1 Lubrication method for Type D

High Ability Type D bearings are designed for oil / air lubrication. Their inner rings have an oiling groove to ensure lubrication on the rolling contact surface for improved lubrication reliability.



Lubrication is accomplished from one side via the outer ring.

Fig. 11. 2 Lubrication method used in Type X

The oiling port in Type X is provided at its outer ring to ensure improved lubrication reliability on the guide ways of the cage. High Ability Type X bearings deliver the best high-speed performance.

11. 3 Performance

High Ability bearings exhibit their maximum performance when used in pairs or when more than two units are combined and when preload is given by position preloading. Shown below is the operating performance of High Ability bearings with preload given by position preloading.

1) Performance of Types R and C

Fig. 11. 3 compares relationships between rotational speed and increases in bearing temperature of Types R and C and conventional high-precision bearings.

High Ability bearings exhibit smaller temperature increases and higher speed limits than conventional bearings whether grease lubrication or oil / air lubrication is applied.

As shown in **Fig. 11. 4**, this type has excellent anti-seizure characteristics with small quantity of lubricant oil in comparison with a conventional type. Thus, the quantity of the lubricant oil can be reduced.

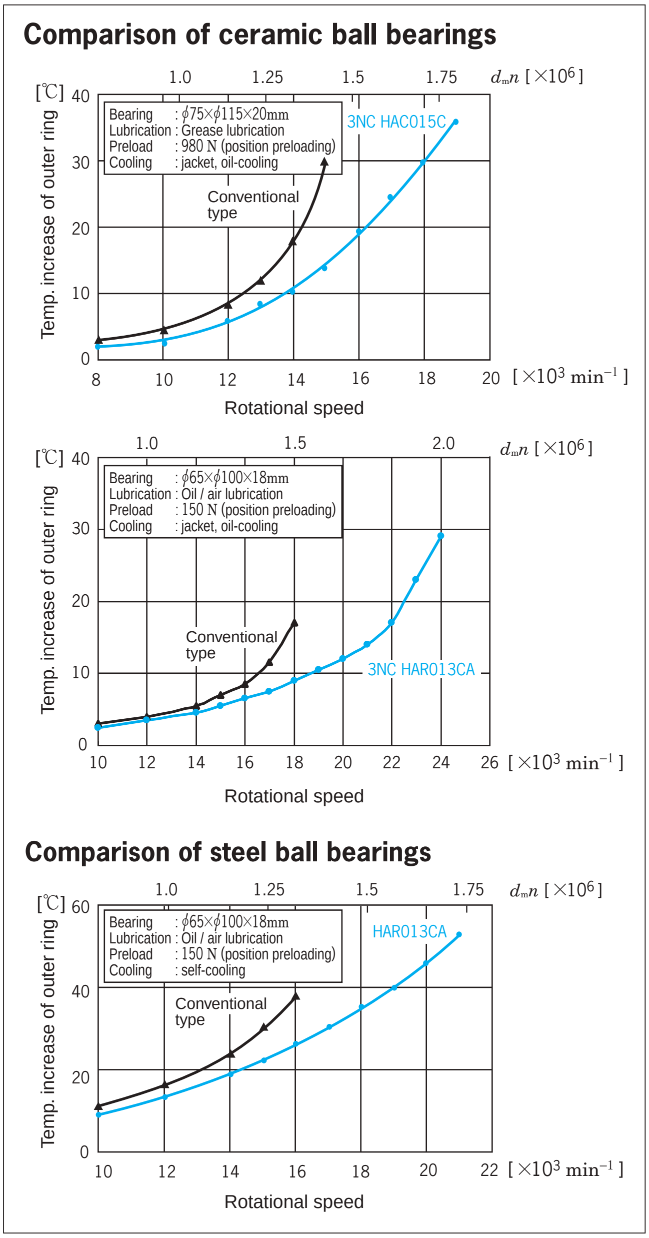


Fig. 11. 3 Comparison of increases in bearing temp.

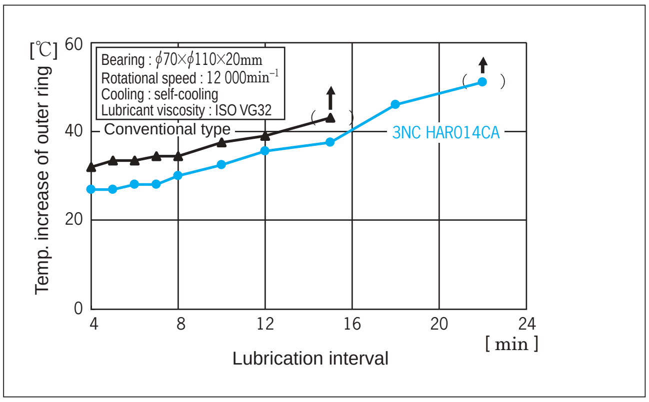

Fig. 11. 4 Comparison of seizure limit oil quantity of Type R and conventional type

High Ability bearings also allow the possible change in lubrication of the spindle from oil / air to grease.

Fig. 11. 5 shows an evaluation example.

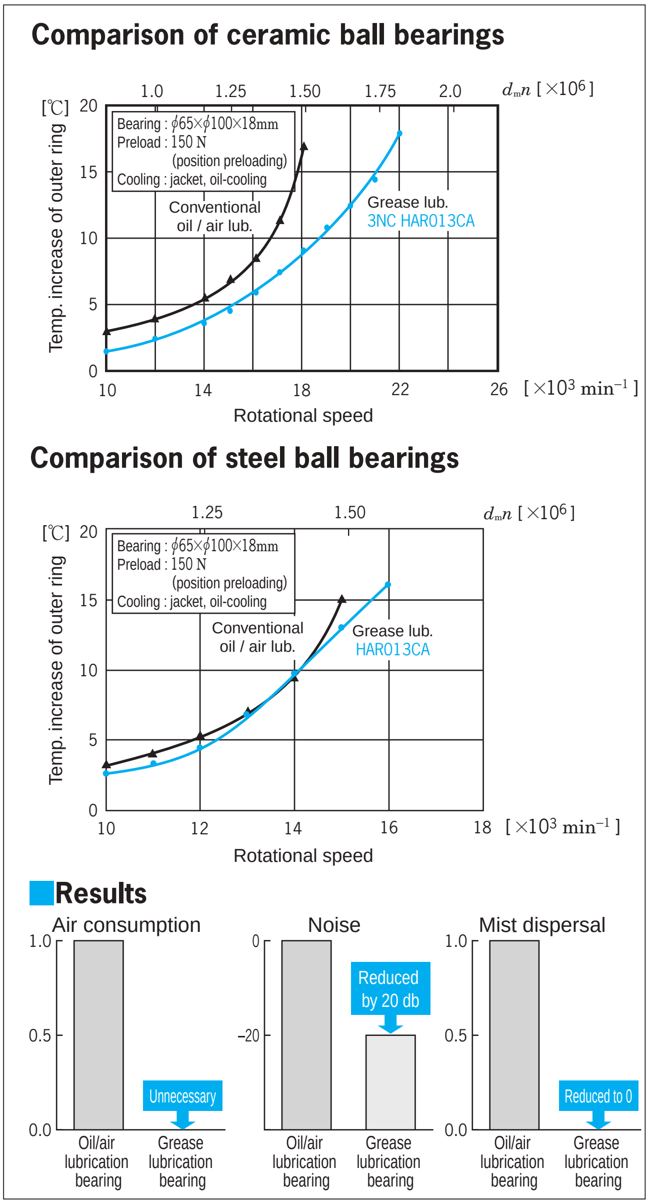

Fig. 11. 5 Comparison of high-speed performance achieved by grease lubrication

2) Performance of Type D

Fig. 11. 6 compares the high-speed performance of Types D and R.

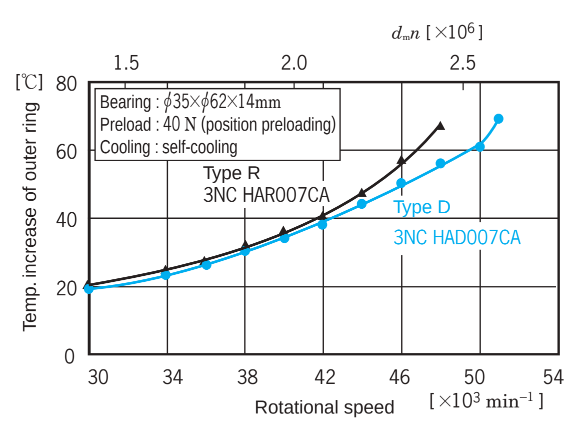

Fig. 11. 6 Comparison of increases in the bearing temp. of Types R and D

Also, Type D causes little wind roar when the bearing is rotating, and is effective in reducing the noise of the spindle device and the air consumption. (**Figs. 11. 7** and **11. 8**)

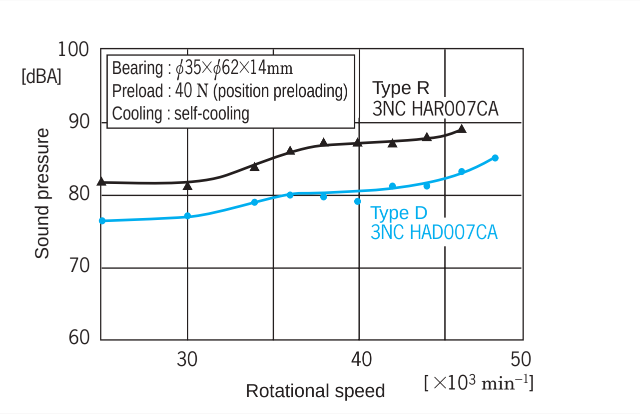

Fig. 11. 7 Comparison of noise by Types R and D

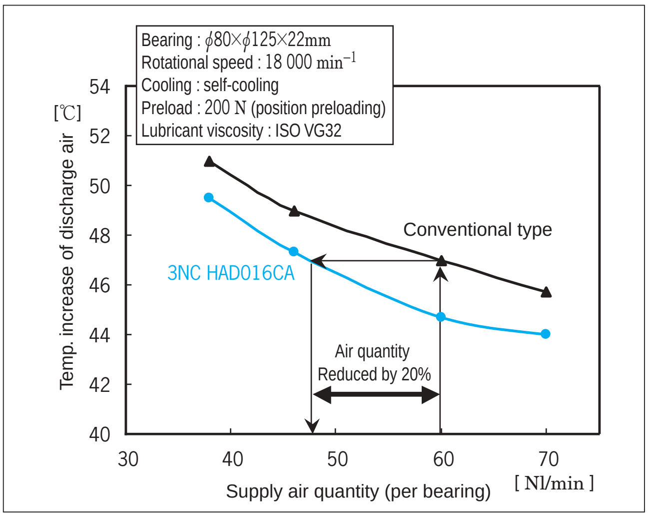

Fig. 11. 8 Comparison of air quantity of Type D and conventional type

3) Performance of Type X

Fig. 11. 9 shows an evaluation example of the Type X bearing operated with a preload given by constant pressure preloading. The maximum rotational speed achieved in this test, or 45 000 min^{-1}, equals 4.05×10^6 in d_mn value.

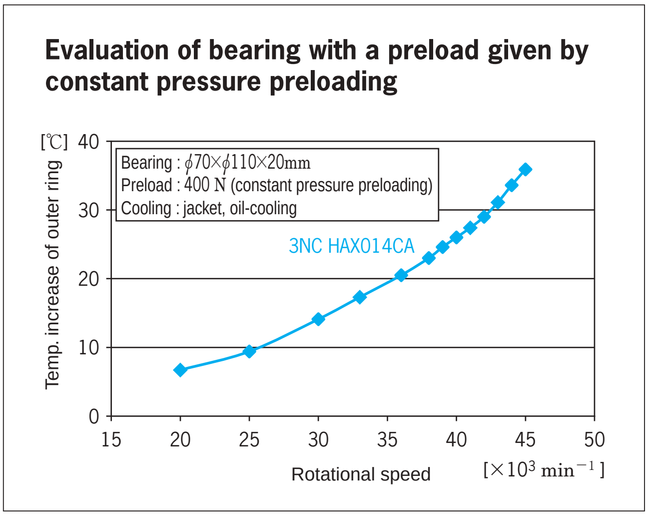

Fig. 11. 9 Temp. increases in Type X bearing

12. Ceramic bearings for machine tool spindles

Compared with bearing steel, ceramics [silicon nitride (Si_3N_4)] has superior properties such as light weight and high elasticity.

One of the advantages of ceramics when used as a material for bearings is a reduction in the slip of rolling elements caused by centrifugal force and gyroscopic moments under high-speed rotation. Ceramic material is highly effective for meeting the low temperature increase requirements of the bearing.

Other advantages include improved rigidity and improvements in seizure life and grease service life. Ceramic bearings, although varying depending on operating conditions, allow approximately 30% to 50% improvement in speed as compared with steel bearings.

12. 1 Ceramic bearing structures and types

There are three types of ceramic bearings differing in their combinations of ceramic parts. Select the most suitable one from **Table 12. 1** according to the machine tool specifications.

Table 12. 1 Ceramic bearing structures and types

	Codes, types, and structures of ceramic bearings		
Code [1]	**3NC**	**6NC**	**NC**
Description	Rolling element : ceramics	Inner ring Rolling element : ceramics	Inner and outer rings Rolling element : ceramics (Full-ceramic)
Angular contact ball bearing			Cylindrical roller bearing			
Note 1) A code is placed before a basic bearing number.

12. 2 Properties of ceramics (Si_3N_4)

Sintered in a high temperature and high-pressure gas atmospheric condition (HIP), ceramics (silicon nitride) has many superior properties such as heat resistance, light weight, low coefficient of linear expansion, and a high elastic modulus.

Table 12. 2 shows a comparison of properties with ceramics and bearing steel.

Table 12. 2 Comparison of properties with ceramics and bearing steel

Item	Unit	Ceramics (Si_3N_4)	Bearing steel (SUJ2)
Heat resistance (in the air)	℃	800	120
Density	g/cm^3	3.2	7.8
Coefficient of linear expansion	K^{-1}	3.2×10^{-6}	12.5×10^{-6}
Vickers' hardness	HV	1 300~2 000	700~800
Young's modulus	GPa	320	208
Poisson's ratio	——	0.29	0.3
Thermal conductivity	W/(m·K)	20	41.9~50.2
Corrosion resistance	——	Good	Not good
Magnetism	——	Non-magnetic material	Ferromagnetic material
Electrical conductivity	——	Not applicable (insulant)	Applicable (electric conductor)
Bonding form of material	——	Covalent bond	Metallic bond

12.3 Load ratings of ceramic bearings

JTEKT has adopted the following values as a standard for load ratings of ceramic bearings. These values are determined from a number of experiments and their results.

(1) Dynamic load rating :
Dynamic load rating of steel bearings $(C)\times1.0$ or greater

(2) Static load rating :
Static load rating of steel bearings $(C_0)\times1.0$

The load applied to a spindle bearing for a machine tool is generally very small as compared with bearing load ratings. Accordingly, it is rare that a bearing reaches its fatigue service life or brinelling occur in its raceway surfaces.

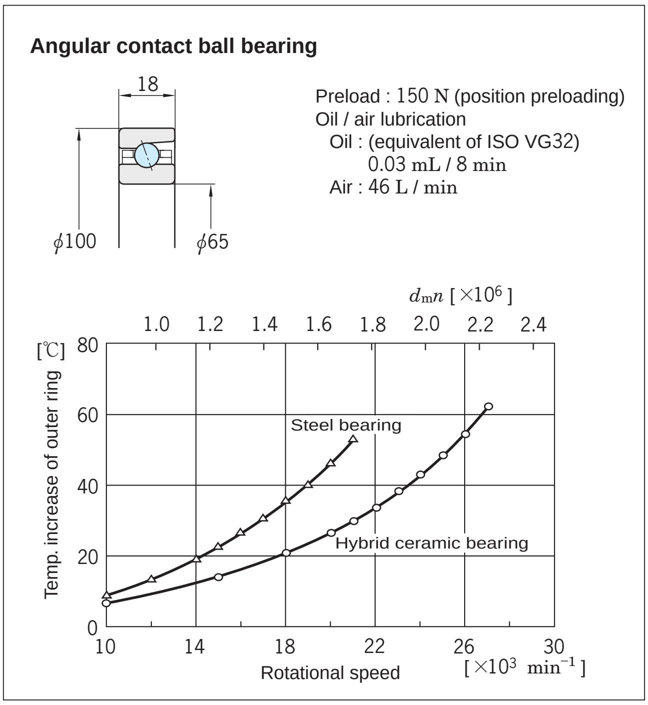
Sufficient care, however, should be taken to ensure that no impact load is applied to the bearing during handling and operation.

12. 4 Sample test data of ceramic bearings

1) High-speed performance of bearings

Ceramic is superior to bearing steel in high-speed rotation performance because it has lower density and linear expansion coefficient.

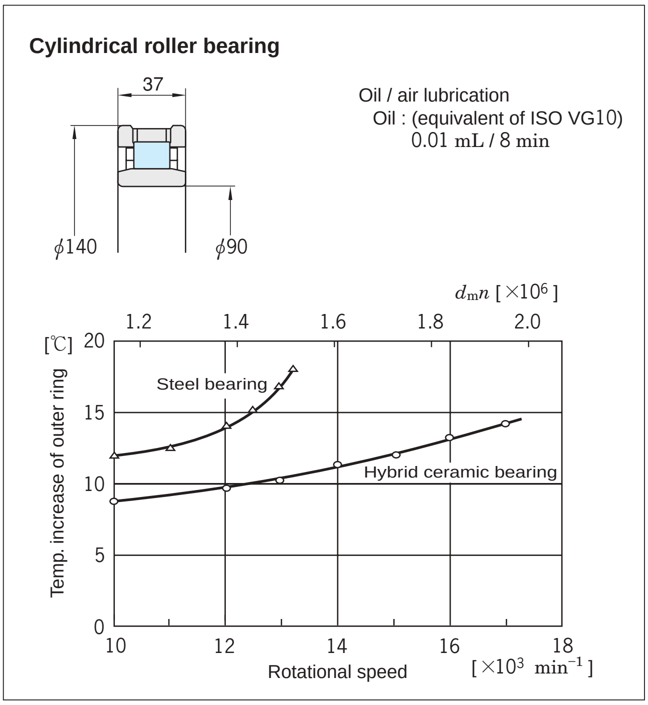
■ Comparison with steel bearing (1)



Preload : 150 N (position preloading)
Oil / air lubrication
Oil : (equivalent of ISO VG32)
0.03 mL / 8 min
Air : 46 L / min

Fig. 12. 1 Comparison of Angular contact ball bearing

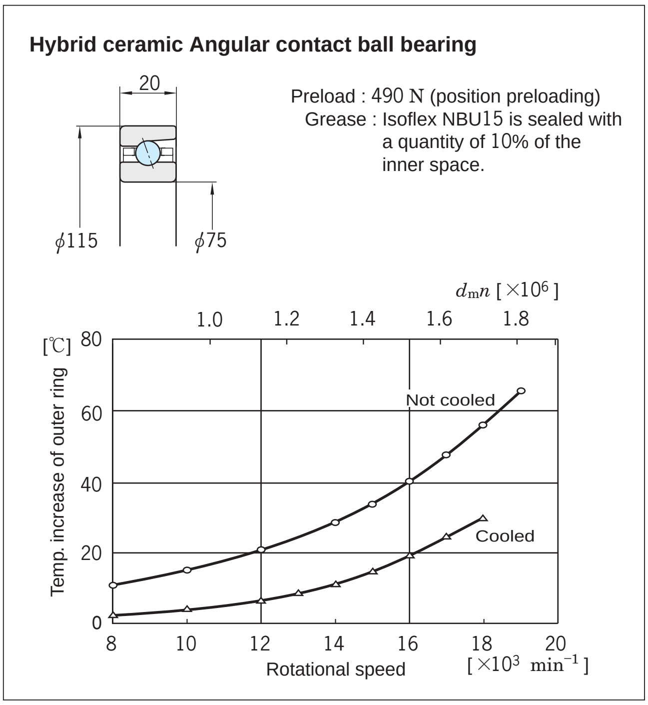
■ Comparison with steel bearing (2)



Oil / air lubrication
Oil : (equivalent of ISO VG10)
0.01 mL / 8 min

Fig. 12. 2 Comparison of cylindrical roller bearing

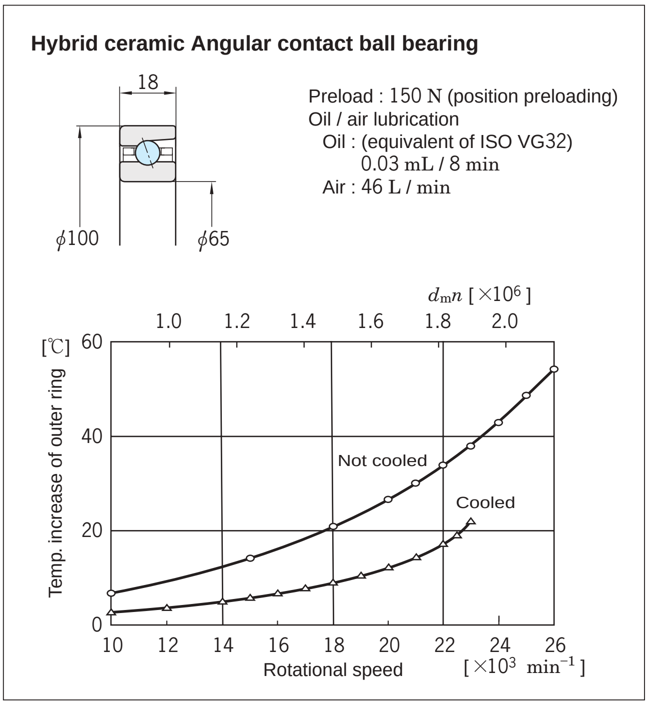
■ High-speed performance (1)



Preload : 490 N (position preloading)
Grease : Isoflex NBU15 is sealed with a quantity of 10% of the inner space.

Fig. 12. 3 High speed performance with grease lub.

■ High-speed performance (2)



Preload : 150 N (position preloading)
Oil / air lubrication
Oil : (equivalent of ISO VG32)
0.03 mL / 8 min
Air : 46 L / min

Fig. 12. 4 High speed performance with oil / air lub.

The 6NC type hybrid ceramic bearings, whose balls and inner ring are both made of ceramic, are superior in high-speed performance to the 3NC type.

In addition, the low-torque 6NC type bearings exhibit lower power losses at high rotational speeds.

■ High-speed performance (3)

Hybrid ceramic Angular contact ball bearing

Oil / air lubrication
Oil : (equivalent of ISO VG10) supplied at 0.05 mL / 2 min
Air : 60 L / min
Cooling : Jacket, oil cooling (10 L / min, control by room temperature)

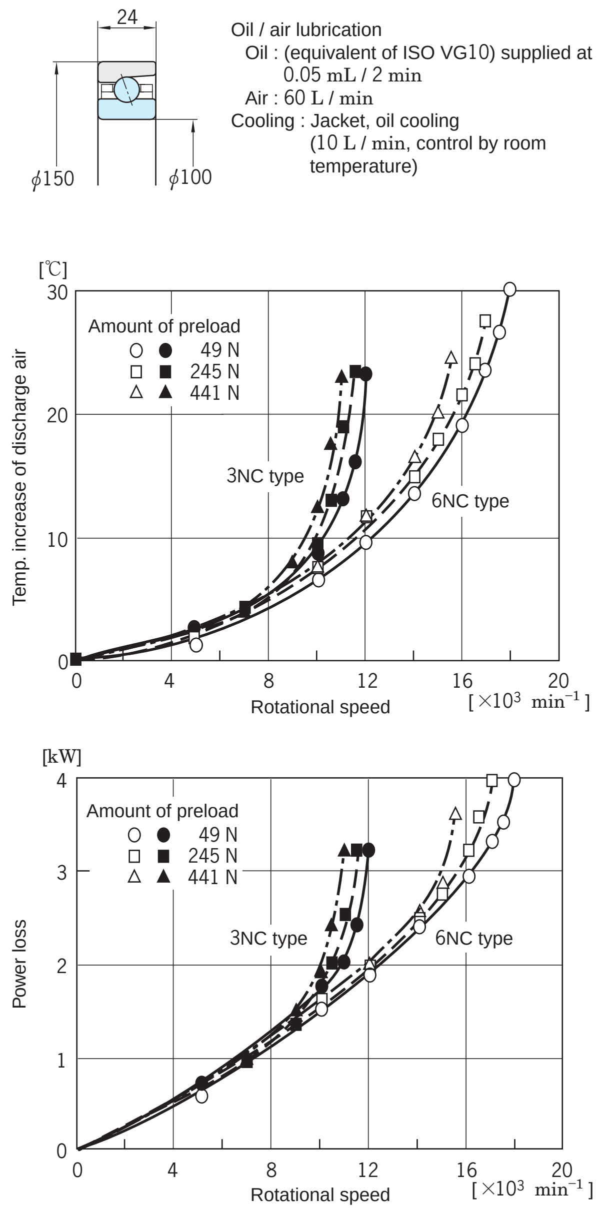


Fig. 12. 5 Comparison of 3NC type and 6NC type hybrid ceramic bearings

Since ceramics and steel have different coefficients of linear expansion, Young's moduli, and Poisson's ratios, care should be taken when fitting for mounting a 6NC type hybrid ceramic bearing on a shaft is selected.

Consult **JTEKT**.

2) Rigidity of bearing

Since ceramics have a greater Young's modulus than bearing steel, the rigidity of a ceramic bearing is higher than that of a steel bearing.

Angular contact ball bearing

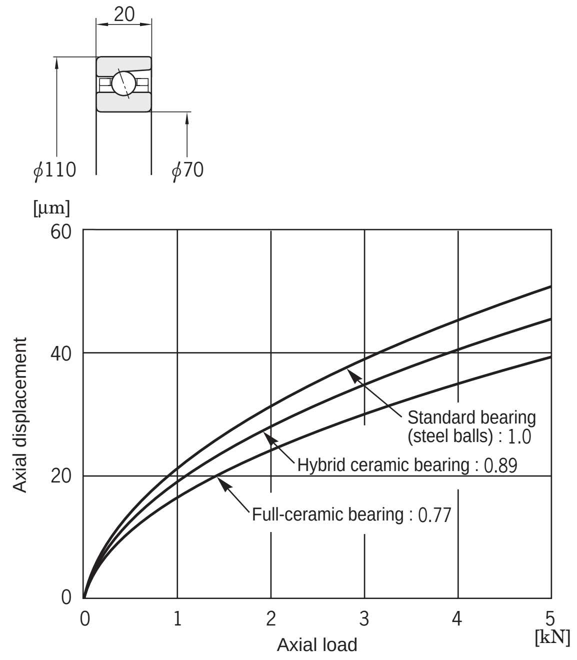

Fig. 12. 6 Comparison of axial displacement

3) Changes in shaft dimensions

Compared with steel bearings, ceramic bearings have higher rigidity and lower temperature increase, thus reducing the risk of changes in shaft dimensions.

Hybrid ceramic angular contact ball bearing

Oil / air lubrication
Oil : (equivalent of ISO VG10) supplied at 0.004 mL / min
Air : 50 L / min
Grease lubrication
Isoflex NBU15 is sealed with a quantity of 10% of the inner space.

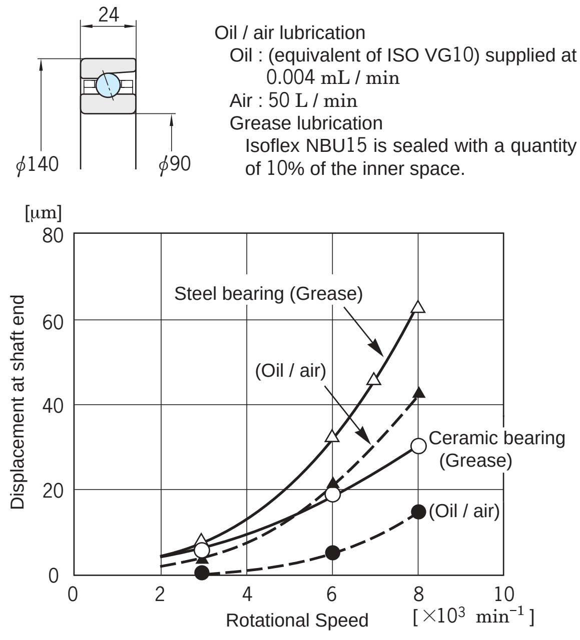

Fig. 12. 7 Comparison of displacement at shaft end

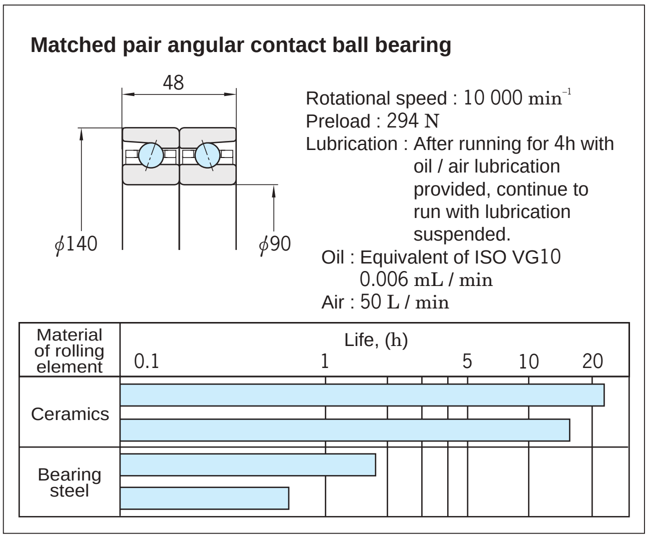
4) Fatigue service life and seizure life of bearings

Ceramic bearings are superior to steel bearings in both seizure life and fatigue service life.

■ Seizure life test results (1)



Matched pair angular contact ball bearing

Rotational speed : 10 000 min^{-1}
Preload : 294 N
Lubrication : After running for 4h with oil / air lubrication provided, continue to run with lubrication suspended.
Oil : Equivalent of ISO VG10 0.006 mL / min
Air : 50 L / min

Precision Ball & Roller Bearings

Bearing Dimension Tables

1. Angular Contact Ball Bearings

Contents

1. Angular contact ball bearings

The angular contact ball bearing can receive a radial load, unidirectional axial load, or a combination of the above loads.

There are four different contact angles to choose from when angular contact ball bearings are considered: 15° (contact angle symbol: C), 20° (CA), 30° (A: to be omitted), and 40° (B).

Of these types, the 15° (contact angle symbol: C), 20° (CA) and 30° (A) bearings are usually used for spindle of machine tools (see **Fig. 1. 1**).

The greater the contact angle, the higher the axial rigidity, and the smaller the contact angle, the more advantageous for high-speed rotations.

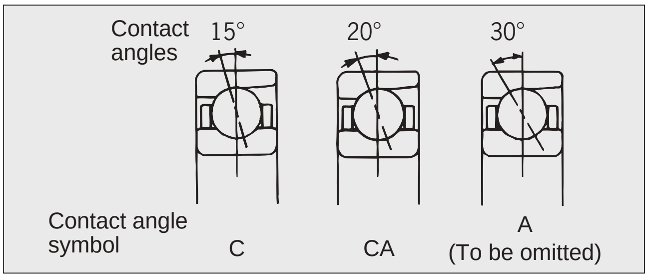

Fig. 1. 1 Contact angles of angular contact ball bearings

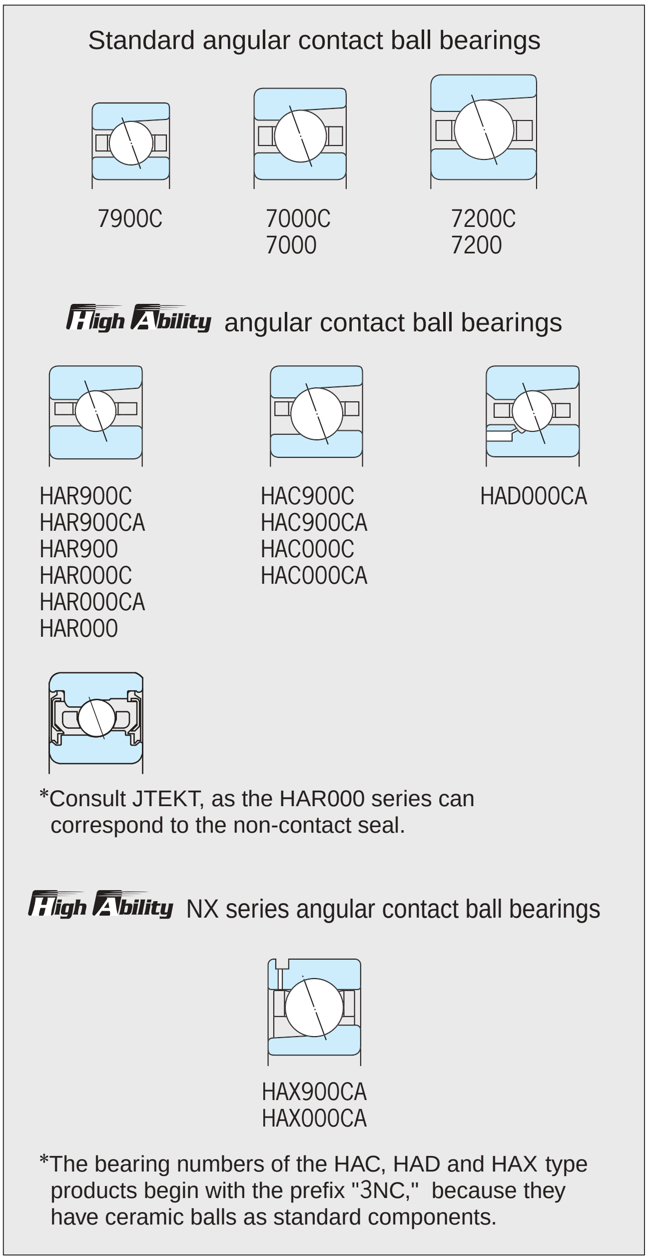
1. 1 Types and features of angular contact ball bearings



*Consult JTEKT, as the HAR000 series can correspond to the non-contact seal.

*The bearing numbers of the HAC, HAD and HAX type products begin with the prefix "3NC," because they have ceramic balls as standard components.

Fig. 1. 2 Types and series of angular contact ball bearings

1) Standard angular contact ball bearings

7900C
7000C, 7000 series
7200C, 7200

The standard cage is of the ball-guided type and is made from polyamide resin.

2) High Ability angular contact ball bearings

HAR900C, HAR900CA, HAR900 HAR000C, HAR000CA, HAR000	High-rigidity type
HAC000C, HAC000CA, HAC900C HAC900CA	High load-rating type
HAD000CA	Ultrahigh-speed type

- The High Ability angular contact ball bearings are optimized for use on high-speed machine tool spindles. They are available in three types: high-rigidity type, high load-rating type, and ultrahigh-speed type. (The ultrahigh-speed type is used with oil / air lubrication.)
- The standard contact angle of these bearings is 20°. The high-rigidity type products are also available with a contact angle of 15° and 30°. The high load-rating type products are also available with a contact angle of 15°.
- These bearings have ceramic balls and an outer ring-guided cage made from reinforced phenol resin as standard components.

  Steel-ball products and ball-guided cage products are also available to suit your needs.

3) High Ability NX series angular contact ball bearings

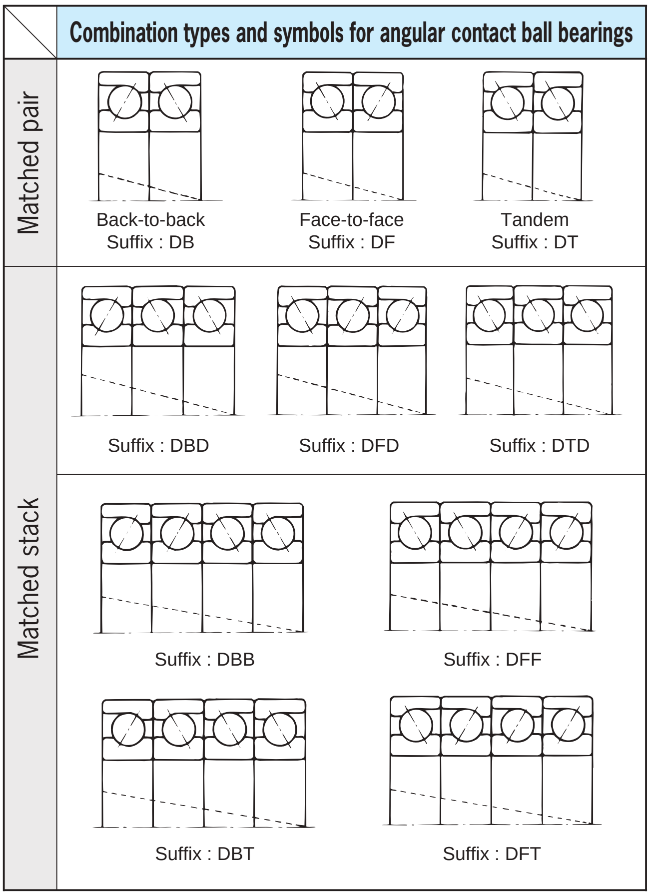
HAX000CA, HAX900CA	Extremely ultrahigh-speed type

- The High Ability NX Series angular contact ball produces less heat and has better high-speed performance than conventional High Ability Series products.
- The standard contact angle of these bearings is 20°. This type of bearing has ceramic balls and an outer ring-guided cage made from PEEK resin.

1. 2 Matched pair angular contact ball bearings

Angular contact ball bearings are used in matched pair, or in combinations of more than two bearings. **Table 1. 1** shows combination types and symbols for angular contact ball bearings.

Table 1. 1 Combination types and symbols for angular contact ball bearings



[Remark] - - - - - indicates the direction of the "V" mark.

Matched pair angular contact ball bearings are adjusted to a preset amount of preload and axial clearance.

The standard preloads are divided into 4 classes : slight preload (symbol : S), light preload (L), medium preload (M), and heavy preload (H). **Table 1. 4** (page 63) shows amounts of standard preloads.

Type G bearings

The type G bearing has both sides machined (flush-ground) to obtain the same stand-out between the inner and outer rings (see **Fig. 1. 3**).

This makes it possible to select any desired combination(s) from **Table 1. 1**.

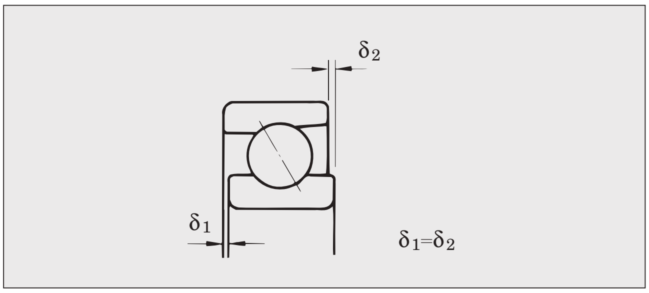


Fig. 1. 3 Flush-ground type G bearings

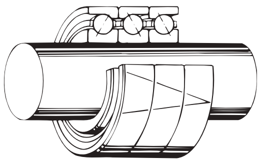
- Examples of identification numbers of type G bearings

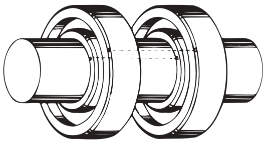
7010GL : Adjustment is made so that any combination of two or more bearings presents light preload (preload symbol : L).

7010GL×2 : Adjustment is made so that any combination of this set of two bearings presents light preload (preload symbol : L).

Cautions for assembly



(Combination mark)



(Mark indicating position of maximum eccentricity)

① A "V" mark is put on the outside surfaces of the outer rings of matched pair or matched stack angular contact ball bearings, to indicate their combination mode. Combine them in such a way that the marks on the outer ring form a "V".

② Chamfered edges of the inner and outer rings are marked with a circle "○", which shows the position of maximum eccentricity.

Mount bearings so that the "○" marks on the inner and outer rings are opposite (180°) to the position of maximum eccentricity of the shaft or housing. By doing so, maximum running accuracy is obtained.

1. 3 Composition of bearing numbers (angular contact ball bearings)

7018C-5K5DBL /27AFTP5

3NCHAC018C-5K5DBCS5/27AFGP4

Ceramic bearing

Bearing type symbols
7 : angular contact ball bearing
HAR, HAC, HAD : High Ability angular contact ball bearings
HAX : High Ability NX series angular contact ball bearings

Dimension series symbols
9 : dimension series 19
0 : dimension series 10
2 : dimension series 02

Bore diameter number
18 : nominal bore diameter : 90 mm
(bore diameter number × 5 equals nominal bore diameter.)

Contact angle symbols
A : nominal contact angle : 30° (A is to be omitted.)
C : nominal contact angle : 15°
CA : nominal contact angle : 20°

Cage guiding system symbols
No specified : outer ring-guiding
–5 : ball-guiding

Special permissible dimensional deviation symbols
K5 : **JTEKT**'s special permissible dimensional deviations are used for the bore diameter of the inner ring and the outside diameter of the outer ring.
No specified : If standard permissible dimensional deviations are used.

Matched pair or stack symbols
DB : back-to-back
DF : face-to-face
DT : tandem
For suffixes that denote bearings which consist of three or four bearings, see **Table 1. 1** (page 59).
G : Type G bearing (flush-ground bearing)

Preload symbol* or **clearance symbols**
(*In some cases, a symbol denoting the specific preload is used.)
S : slight preload
L : light preload
M : medium preload
H : heavy preload
CS : clearance
CY : negative clearance (preload)
(CS5 : The mean value of the clearance is 5µm.)
(For amount of preload, see **Table 1. 4** (page 63).)

Spacer number/symbols
No specified : If no spacer is provided.
/27 : spacer with lubrication hole, 27 mm in nominal width
A : spacer not provided with lubrication hole (symbol A is not used if the spacer has a lubrication hole.)

Cage symbols
FG : molded cage made of polyamide resin
FT : machined cage made of reinforced phenolic
FY : machined cage made of copper alloy
PG : PEEK resin cage

Tolerance class symbols
P5 : JIS class 5
P4 : JIS class 4
P2 : JIS class 2

1. 4 Tolerance of bearings

The tolerance of the precision angular contact ball bearing is compliant with permissible dimensional deviations and limits of classes 5, 4, and 2 as specified in JIS B 1514 for radial bearings (tapered roller bearings not included).

Permissible dimensional deviations and limits of radial bearings are shown in **Table 1. 2**.

Table 1. 3 (page 62) shows **JTEKT**'s special permissible dimensional deviations (K5) used to facilitate multi-row combinations (K5 is used for the bore diameter of the inner ring and the outside diameter of the outer ring).

Table 1. 2(1) Permissible dimensional deviations and limits of angular contact ball and cylindrical roller bearings

S_d : Perpendicularity of inner ring face with respect to the bore

S_{ia} : Axial runout of assembled bearing inner ring

[Notes] 1) Tolerance class 4 is applied to bearings of diameter series 0, 1, 2, 3, and 4.

2) Applied to angular contact ball bearings.

3) Applied to individual bearing rings manufactured for matched pair or stack bearings.

4) Class 5 tolerance complies with JIS; class 4 tolerance is **JTEKT** standard.

[Remark] Values in italics comply with **JTEKT** standards.

[Note] 1) K5 denotes specially formulated **JTEKT** standards for the purpose of minimizing individual differences in performance, which may occur as a result of fitting stack-mounted to bearings.

1. 5 Standard preloads for matched pair angular contact ball bearings

Back-to-back and face-to-face matched pair bearings are often used under a preload.
By applying a preload to a bearing, the following effects are realized.

1) The rigidity of a bearing can be improved.
2) Running accuracy is improved.
3) Abnormal noise caused by vibration and resonance is prevented.

A greater preload results in higher bearing rigidity.
However, such preload also influences other parameters of the bearing : service life, temperature, frictional torque, etc.
Therefore, it is important to select an adequate preload, taking into consideration the rotational speed and lubrication conditions.

JTEKT offers 4 types of preset preloads, slight preload (S), light preload (L), medium preload (M), and heavy preload (H). This will enable the user to select any desired preload suitable for individual applications (see **Table 1. 4**).

As a guide for selecting the preload, light or medium preload is used for spindles of grinding machines, while medium or heavy preloads are used for spindle of lathes and milling machines.

Table 1. 4(1) Standard preloads for matched pair angular contact ball bearings

1. 6 Axial load and displacement (angular contact ball bearings)

Fig. 1. 4 shows relationships between axial load and displacement of **KOYO** angular contact ball bearings.

The graphs indicate that the greater the contact angle of a bearing, the smaller the axial displacement (high rigidity).

The displacement curve of duplex bearings under a given preload is determined by the method shown in **Fig. 6. 1** on page 30.

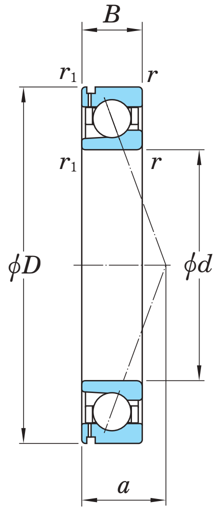
(24) 3NCHAX900CA series (contact angle : 20°)

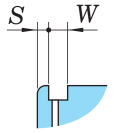
Fig. 1. 4 (6) Relationships between axial load and displacement (angular contact ball bearings)

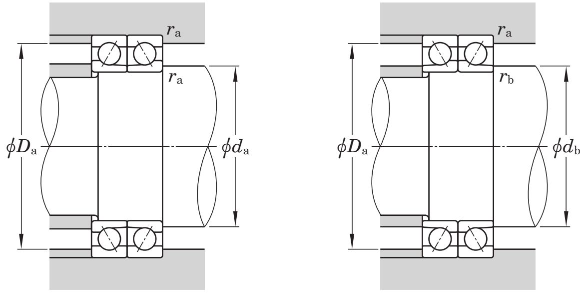
*The axial displacements shown above are values of the single-row bearings not preloaded.

High Ability NX series

3NCHAX000CA series
3NCHAX900CA series







We recommend that recesses be added at r_a and r_b.

Static equivalent load $P_0 = X_0F_r + Y_0F_a$

Contact angle	Single row/ Tandem		Back-to-back/ Face-to-face	
	X_0	Y_0	X_0	Y_0
20°	0.5	0.42	1	0.84

Note that in the case of single row or tandem, assume $P_0 = F_r$ if $P_0 < F_r$.

Dynamic equivalent load $P = XF_r + YF_a$

Contact angle	$\frac{if_0F_a}{C_{0r}}$ [1]	e	Single row/Tandem				Back-to-back/Face-to-face			
			$\frac{F_a}{F_r} \leqq e$		$\frac{F_a}{F_r} > e$		$\frac{F_a}{F_r} \leqq e$		$\frac{F_a}{F_r} > e$	
			X	Y	X	Y	X	Y	X	Y
20°		0.57	1	0	0.43	1	1	1.09	0.70	1.63

1) For i, use 2 for DB & DF and 1 for single & DT.

[Remarks]
1. For the dimensions of the spacers for oil / air lubrication, refer to **Table 9. 4** on page 41 to 45.
2. For the discharge intervals of the oil / air, refer to **Supplementary table 6** on page 203.
3. CA in the bearing number indicates a nominal contact angle of 20°.

Basic load ratings in case of multiple-row combination bearing

	Basic dynamic load ratings	Basic static load ratings
2-row	$C_r \times 1.62$	$C_{0r} \times 2$
3-row	$C_r \times 2.16$	$C_{0r} \times 3$
4-row	$C_r \times 2.64$	$C_{0r} \times 4$

[Note] 1) The blue bearing numbers indicate recommended products.

[Remarks] 1. For the dimensions of the spacers for oil / air lubrication, refer to **Table 9. 4** on page 41 to 45.
2. For the discharge intervals of the oil / air, refer to **Supplementary table 6** on page 203.
3. C, CA, and no character string in the bearing number indicate nominal contact angles of 15°, 20°, and 30°, respectively.

Basic load ratings in case of multiple-row combination bearing

	Basic dynamic load ratings	Basic static load ratings
2-row	$C_r\times1.62$	$C_{0r}\times2$
3-row	$C_r\times2.16$	$C_{0r}\times3$
4-row	$C_r\times2.64$	$C_{0r}\times4$

Speed coefficients in case of multiple-row combination bearing

Combination types	Combination symbols	Preload when mounting			
		Preload S	Preload L	Preload M	Preload H
∅ ⦸	DB	0.85	0.80	0.65	0.55
∅∅ ⦸⦸	DBB	0.80	0.75	0.60	0.45
∅∅ ⦸	DBD	0.75	0.70	0.55	0.40

*Speed coefficients also vary depending on the distance of bearings.
*Consult JTEKT for information on High Ability bearings.

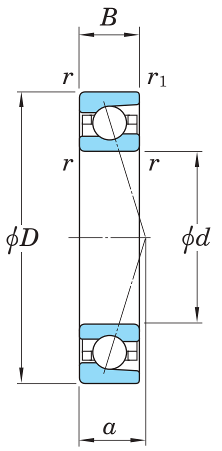
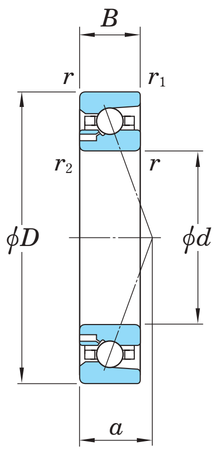
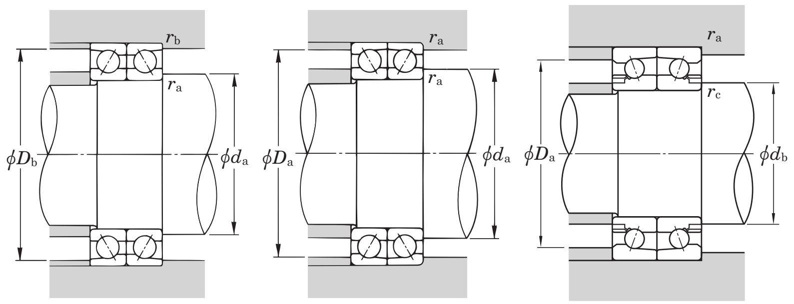
HAR



3NCHAC



3NCHAD



We recommend that recesses be added at r_a, r_b, and r_c.

Static equivalent load $P_0 = X_0F_r + Y_0F_a$

Contact angle	Single row/ Tandem		Back-to-back/ Face-to-face	
	X_0	Y_0	X_0	Y_0
15°	0.5	0.46	1	0.92
20°	0.5	0.42	1	0.84
30°	0.5	0.33	1	0.66

Note that in the case of single row or tandem, assume $P_0 = F_r$ if $P_0 < F_r$.

Dynamic equivalent load $P = XF_r + YF_a$

Contact angle	$\frac{if_0F_a}{C_{0r}}$ [1]	e	Single row/Tandem $\frac{F_a}{F_r} \leqq e$		Single row/Tandem $\frac{F_a}{F_r} > e$		Back-to-back/Face-to-face $\frac{F_a}{F_r} \leqq e$		Back-to-back/Face-to-face $\frac{F_a}{F_r} > e$	
			X	Y	X	Y	X	Y	X	Y
15°	0.178	0.38	1	0	0.44	1.47	1	1.65	0.72	2.39

[Note] 1) The blue bearing numbers indicate recommended products.

[Remarks] 1. For the dimensions of the spacers for oil / air lubrication, refer to **Table 9. 4** on page 41 to 45.
2. For the discharge intervals of the oil / air, refer to **Supplementary table 6** on page 203.
3. C, CA, and no character string in the bearing number indicate nominal contact angles of 15°, 20°, and 30°, respectively.

[Note] 1) The blue bearing numbers indicate recommended products.

[Remarks] 1. For the dimensions of the spacers for oil / air lubrication, refer to **Table 9. 4** on page 41 to 45.
2. For the discharge intervals of the oil / air, refer to **Supplementary table 6** on page 203.
3. C, CA, and no character string in the bearing number indicate nominal contact angles of 15°, 20°, and 30°, respectively.

Basic load ratings in case of multiple-row combination bearing

	Basic dynamic load ratings	Basic static load ratings
2-row	C_r×1.62	C_{0r}×2
3-row	C_r×2.16	C_{0r}×3
4-row	C_r×2.64	C_{0r}×4

Speed coefficients in case of multiple-row combination bearing

Combination types	Combination symbols	Preload when mounting Preload S	Preload L	Preload M	Preload H
∅ ⦸	DB	0.85	0.80	0.65	0.55
∅∅ ⦸⦸	DBB	0.80	0.75	0.60	0.45
∅∅ ⦸	DBD	0.75	0.70	0.55	0.40

*Speed coefficients also vary depending on the distance of bearings.
*Consult JTEKT for information on High Ability bearings.

[Note] 1) The blue bearing numbers indicate recommended products.

[Remarks] 1. For the dimensions of the spacers for oil / air lubrication, refer to **Table 9. 4** on page 41 to 45.
2. For the discharge intervals of the oil / air, refer to **Supplementary table 6** on page 203.
3. C, CA, and no character string in the bearing number indicate nominal contact angles of 15°, 20°, and 30°, respectively.

Basic load ratings in case of multiple-row combination bearing

	Basic dynamic load ratings	Basic static load ratings
2-row	$C_r\times1.62$	$C_{0r}\times2$
3-row	$C_r\times2.16$	$C_{0r}\times3$
4-row	$C_r\times2.64$	$C_{0r}\times4$

Speed coefficients in case of multiple-row combination bearing

Combination types	Combination symbols	Preload when mounting			
		Preload S	Preload L	Preload M	Preload H
∅ ⦸	DB	0.85	0.80	0.65	0.55
∅∅ ⦸⦸	DBB	0.80	0.75	0.60	0.45
∅∅ ⦸	DBD	0.75	0.70	0.55	0.40

*Speed coefficients also vary depending on the distance of bearings.
*Consult JTEKT for information on High Ability bearings.

[Note] 1) The blue bearing numbers indicate recommended products.

[Remarks] 1. For the dimensions of the spacers for oil / air lubrication, refer to **Table 9. 4** on page 41 to 45.

2. For the discharge intervals of the oil / air, refer to **Supplementary table 6** on page 203.

3. C, CA, and no character string in the bearing number indicate nominal contact angles of 15°, 20°, and 30°, respectively.

Basic load ratings in case of multiple-row combination bearing

[Note] 1) The blue bearing numbers indicate recommended products.

[Remarks] 1. For the dimensions of the spacers for oil / air lubrication, refer to **Table 9. 4** on page 41 to 45.
2. For the discharge intervals of the oil / air, refer to **Supplementary table 6** on page 203.
3. C, CA, and no character string in the bearing number indicate nominal contact angles of 15°, 20°, and 30°, respectively.

Basic load ratings in case of multiple-row combination bearing

	Basic dynamic load ratings	Basic static load ratings
2-row	$C_r \times 1.62$	$C_{0r} \times 2$
3-row	$C_r \times 2.16$	$C_{0r} \times 3$
4-row	$C_r \times 2.64$	$C_{0r} \times 4$

Speed coefficients in case of multiple-row combination bearing

Combination types	Combination symbols	Preload when mounting			
		Preload S	Preload L	Preload M	Preload H
∅ ⦸	DB	0.85	0.80	0.65	0.55
∅∅ ⦸⦸	DBB	0.80	0.75	0.60	0.45
∅∅ ⦸	DBD	0.75	0.70	0.55	0.40

*Speed coefficients also vary depending on the distance of bearings.
*Consult JTEKT for information on High Ability bearings.

2. Cylindrical Roller Bearings

Contents

Page

■ Bearing dimension tables

2. Cylindrical roller bearings

The cylindrical roller bearing has high radial rigidity and is suitable for high-speed rotation through an arrangement of many rollers and a line contact which is made between the rollers and raceways.

The bores of cylindrical roller bearings are either cylindrical or tapered. With a bearing having a tapered bore, its radial internal clearance can be set with ease to a given value by adjusting the extent to which the bearing is pushed onto the shaft.

2. 1 Types and features of cylindrical roller bearings

The cylindrical roller bearing is divided into two types: double row and single row bearings. Both having outer ring which is separable from the inner to facilitate mounting and dismounting from shaft and housing (see **Fig. 2. 1**).

1) Double row cylindrical roller bearings

The double row cylindrical roller bearing is classified into the NN30 and NNU49 series.

Some of these bearings have a lubrication groove and holes provided at the center of the outside surface of the outer rings in order to attain a sufficient supply of lubricant to the inside of the bearing (the suffix W is added).

2) Single row cylindrical roller bearings

Single row cylindrical roller bearings for the spindles of machine tools are often selected from the N10 series.

The bore and outside diameters of the N10 series are the same as those of the NN30: double row cylindrical roller bearing series.

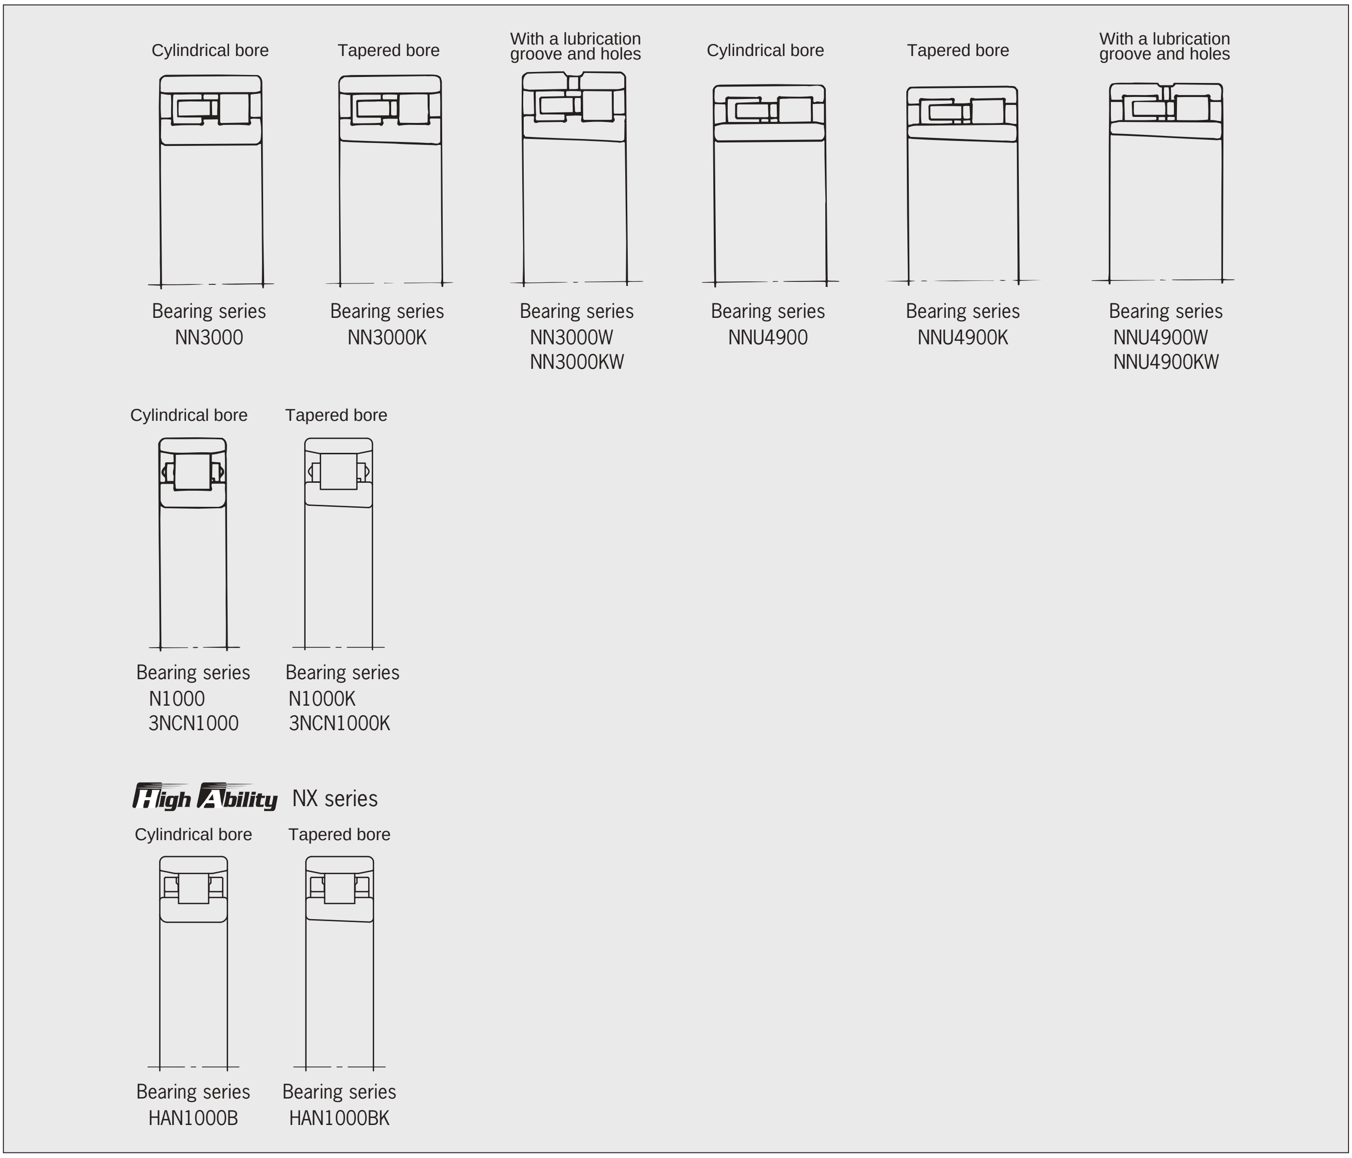

Fig. 2. 1 Types and series of cylindrical roller bearings for machine tool spindles

2. 2 Composition of bearing numbers (cylindrical roller bearings)

NN3009 KWC1NAFWP4
N1009 C1NAFYP4
HAN1009BK C1NAPGP4

Bearing type symbols
NN : double row/ inner ring with rib
NNU : double row/ outer ring with rib
N : single row/ inner ring with rib
HAN : High Ability NX series single row/ inner ring with rib Ultrahigh-speed type

Dimension series symbols
30 : dimension series 30
49 : dimension series 49
10 : dimension series 10

Bore diameter number
09 : nominal bore diameter : 45 mm
(Bore diameter number × 5 equals nominal bore diameter.)

Internal design code

Ring shape symbols
K : bearing with tapered bore (1/12 taper)
W : outer ring with a lubrication groove and holes

Tolerance class symbols
P5 : JIS class 5
P4 : JIS class 4
P2 : JIS class 2

Cage symbols
FW : separable machined cage made of copper alloy
FY : integrated machined cage made of copper alloy (Double row bearing) Machined cage made of copper alloy with rivets (single row bearing)
FG : molded cage made of polyamide resin
(Consult **JTEKT** for detailed information about the available types.)
PG : PEEK resin cage

Internal clearance symbols
C9NA ~C3NA : radial internal clearance of non-interchangeable bearings
(For values of radial internal clearances, see **Table 2. 2** (page 107).)

For ceramic bearings

3NCN1009C1NAFYP4

Ceramic bearing

2. 3 Tolerance of cylindrical roller bearings

1) Boundary dimension and running accuracies

The tolerance of precision cylindrical roller bearings is compliant with permissible dimensional deviations and limits of classes 5, 4, and 2 as specified in JIS B 1514 for radial bearings (tapered roller bearings not included).

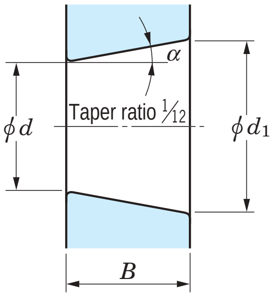
Permissible dimensional deviations and limits to boundary dimension and running accuracies are shown in **Table 1. 2** on page 61.

2) Permissible dimensional deviations and limits for tapered bores

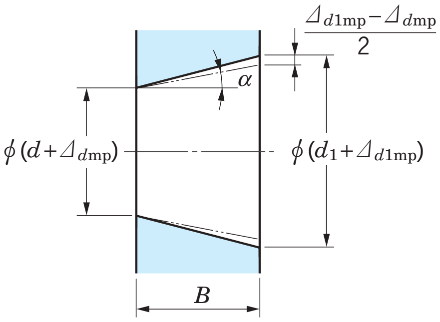
The dimensional deviations and limits for tapered bores of radial bearings of class 0 only are specified in JIS B 1514.

JTEKT has formulated special standards for dimensional deviations and limits for tapered bores of radial bearings of classes 5, 4, and 2 (see **Table 2. 1**).

Table 2. 1 Dimensional deviations and limits for tapered bores of radial bearings (classes 5, 4, and 2)



Theoretical tapered bore



Tapered bore with single plane mean bore diameter deviation

Unit : μm

315	**400**	+40	0	+23	0	+12	0	23	18	18	14	—

[Notes] 1) Permissible dimensional deviation for the taper angle is $4°46'18.8"^{+26"}_{0}$

2) Applied to all radial planes of tapered bores.

[Remarks] 1. **Scope** These values are applied to the tapered bores with a reference taper ratio of 1/12.

2. **Symbols for quantities**

d_1 : reference diameter at theoretical large end of tapered bore $d_1 = d + \frac{1}{12}B$

Δ_{dmp} : single plane mean bore diameter deviation at theoretical small end of tapered bore

Δ_{d1mp} : single plane mean bore diameter deviation at theoretical large end of tapered bore

V_{dsp} : single plane bore diameter variation

B : nominal inner ring width

α : $\frac{1}{2}$ of the nominal taper angle of tapered bore

$\alpha = 2°23'9.4"$
$= 2.385\ 94°$
$= 0.041\ 643$ rad

2. 4 Radial internal clearances of cylindrical roller bearings

In order to minimize variations in the running accuracy of machine tool spindles, the values of the radial internal clearance should be same as those of special radial internal clearance of non-interchangeable bearings.

Table 2. 2 shows values of non-interchangeable radial internal clearances for cylindrical roller bearings.

Since the inner and outer rings of cylindrical roller bearings for spindles of machine tools are not interchangeable, care should be taken when using them.

Table 2. 2 Values of radial internal clearances for cylindrical roller bearings

[Remarks] 1. For the dimensions of the spacers for oil / air lubrication, refer to **Table 9. 4(5)** on page 45.
2. For the discharge intervals of the oil / air, refer to **Supplementary table 6** on page 203.

3. Angular Contact Ball Bearings for Axial Load

Contents

3. Angular contact ball bearings for axial load

JTEKT produces double direction angular contact thrust and high-speed matched pair angular contact ball bearings to receive the axial loads from spindles of machine tools.

3. 1 Types and features of angular contact ball bearings for axial load

Table 3. 1 Types and features of angular contact ball bearings for axial load

Type Diameter series	Double direction angular contact thrust ball bearings	High-speed matched pair angular contact ball bearings		To combine with double row cylindrical roller bearings
				Remark: These bearings are used primarily in combination with double row cylindrical roller bearings for radial load. Combinations are as shown below.
0	2344 B	ACT 0 DB	ACT 0 BDB	Placed next to the small tapered bore diameter side of NN30K, or used in tandem with NN30 (cylindrical bore).
	2347 B	—	—	Placed next to the large tapered bore diameter side of NN30K.
9	2394 B	—	—	Placed next to the small tapered bore diameter side of NNU49K, or used in tandem with NNU49 (cylindrical bore).
	2397 B	—	—	Placed next to the large tapered-bore diameter side of NNU49K.
Features	● Axial load can be applied in both directions, and the rigidity in the axial direction is high. ● Bearings having greater contact angles are more suitable where rigidity is a priority, and those having smaller contact angles are more appropriate where high-speed performance is a priority.	● Negative tolerances on the outside diameters are used to permit axial load only. ● Having small contact angles, these are suitable for high-speed rotations. ● These bearings are interchangeable with 2344 B series.		———
Interchangeability	 Example of mounting in tandem with 2344 B  Example of mounting in tandem with ACT 0 DB or ACT 0 BDB Since the combined width "$2B$" of ACT 0 DB and ACT 0 BDB is equal to dimension "C_1" of 2344 B, it is not necessary to change shaft and housing dimensions. Changing the width of spacer Ⓐ is sufficient.			

3. 2 Composition of bearing numbers (angular contact ball bearings for axial load)

Double direction angular contact thrust ball bearings

2 3 4 4 18 B FY P4

Double direction angular contact thrust ball bearings

Contact angle symbols
3 : nominal contact angle 60°

Diameter series symbols
4 : diameter series 0
9 : diameter series 9

Bearing bore diameter classification symbols
4 : small bore diameter type
7 : large bore diameter type

Tolerance class symbols
P5 : equivalent of JIS class 5
P4 : equivalent of JIS class 4

Cage symbols
FY : machined cage made of copper alloy

Outer ring configuration symbols
B : integrated outer ring type

Bore diameter number
18 : nominal bore diameter 90 mm
(Bore diameter number × 5 equals nominal bore diameter.)

High-speed matched pair angular contact ball bearings

ACT 0 18 B DB M FT P4

High-speed matched pair angular contact ball bearings

Diameter series 0

Bore diameter number
18 : nominal bore diameter 90 mm
(Bore diameter number × 5 equals nominal bore diameter.)

Contact angle symbols
A (to be omitted) : nominal contact angle 30°
B : nominal contact angle 40°

Back-to-back symbols

Tolerance class symbols
P5 : equivalent of JIS class 5
P4 : equivalent of JIS class 4

Cage symbols
FG : molded cage made of polyamide resin (ball-guiding type)
FT : machined cage made of reinforced phenolic resin (outer ring-guiding type)
FY : machined cage made of copper alloy (outer ring-guiding type)

Preload symbols
L : light preload
M : medium preload
(See **Table 3. 4** (page 125) for preload values.)

3. 3 Tolerance of angular contact ball bearings for axial load

The tolerance of double direction angular contact thrust ball bearings is shown in **Table 3. 2**.
The tolerance of high-speed matched pair angular contact ball bearings is shown in **Table 3. 3** (page 123 and 124).

The tolerance of these bearings complies with **JTEKT** standards Classes 5 and 4 (equivalent of JIS Classes 5 and 4).

Table 3. 2 Permissible dimensional deviations and limits to double direction angular contact thrust ball bearings (JTEKT standards)

(1) Inner ring and assembled bearing width

Unit : μm

Nominal bore diameter d (mm)		$\Delta_{d\mathrm{mp}}$ or $\Delta_{d\mathrm{s}}$ 1)				Actual bearing width deviation $\Delta_{T\mathrm{s}}$		Inner ring width variation $V_{B\mathrm{s}}$		Perpendicularity of inner ring face with respect to the bore S_d		Axial runout of assembled bearing inner ring S_{ia}

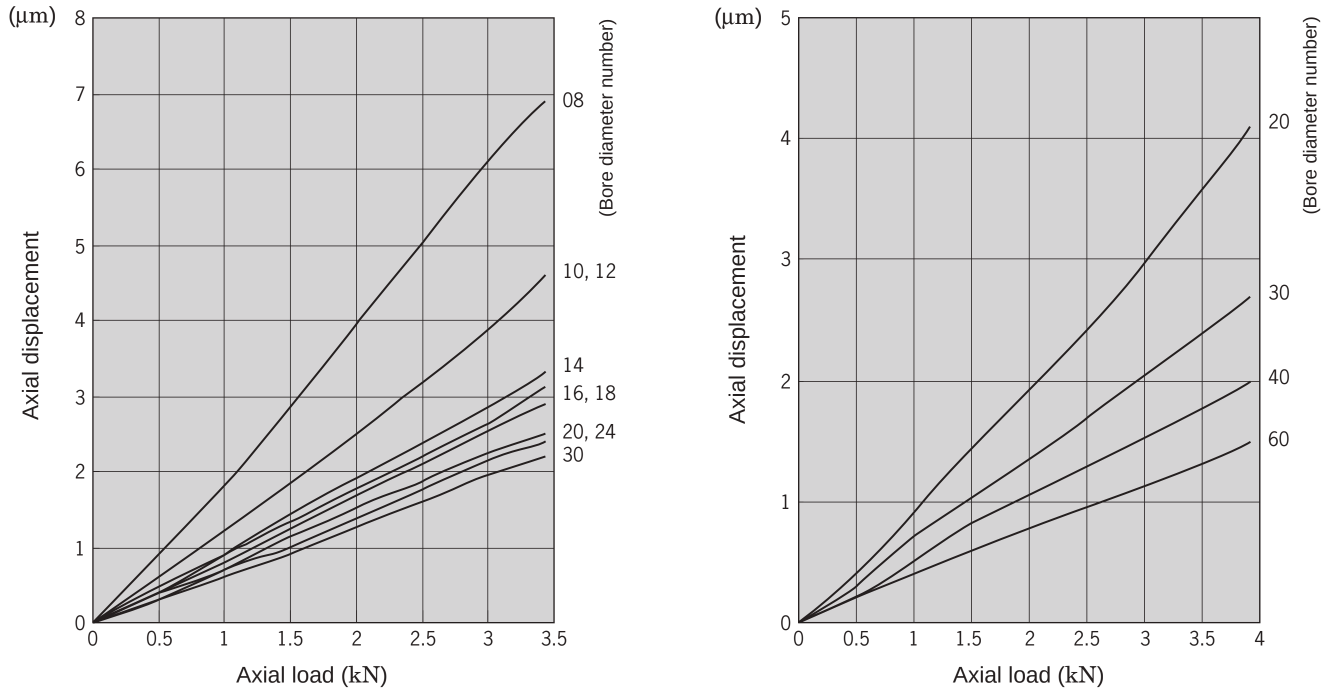
3. 5 Axial load and displacement (angular contact ball bearings for axial load)

Fig. 3. 1 show relationships between axial load and displacement respectively for double direction angular contact thrust and high-speed matched pair angular contact ball bearings when a standard preload is applied.



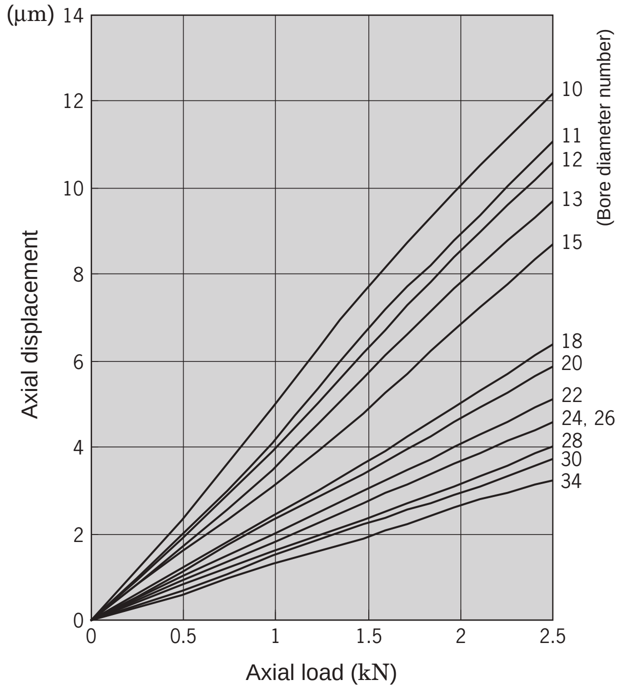
(1) 234400B and 234700B series (contact angle : 60°)

(2) 239400B and 239700B series (contact angle : 60°)

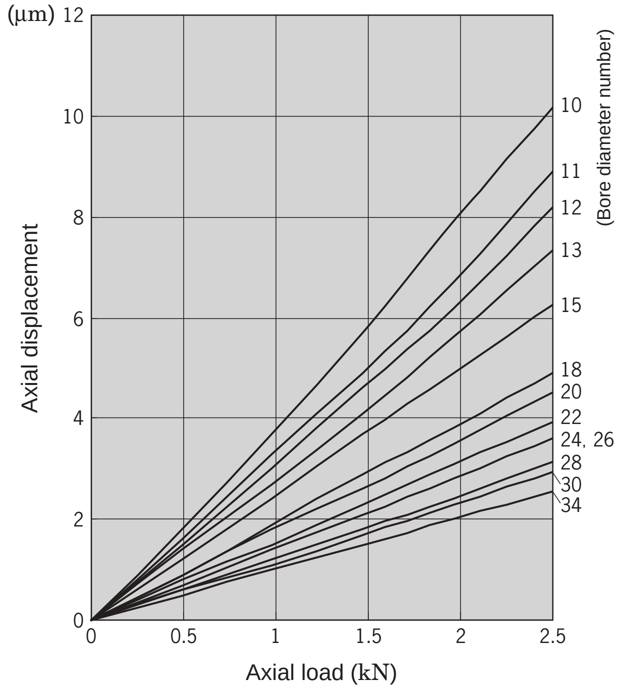
Fig. 3. 1(1) Relationships between axial load and displacement (double direction angular contact thrust ball bearings)

(3) ACT000 series (contact angle 30°)

a) When preload L is applied

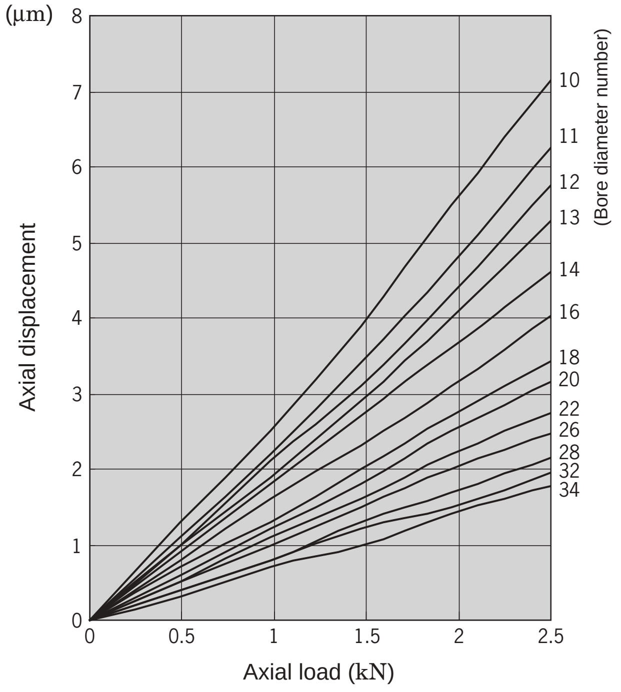


b) When preload M is applied



(4) ACT000B series (contact angle 40°)

a) When preload L is applied



b) When preload M is applied

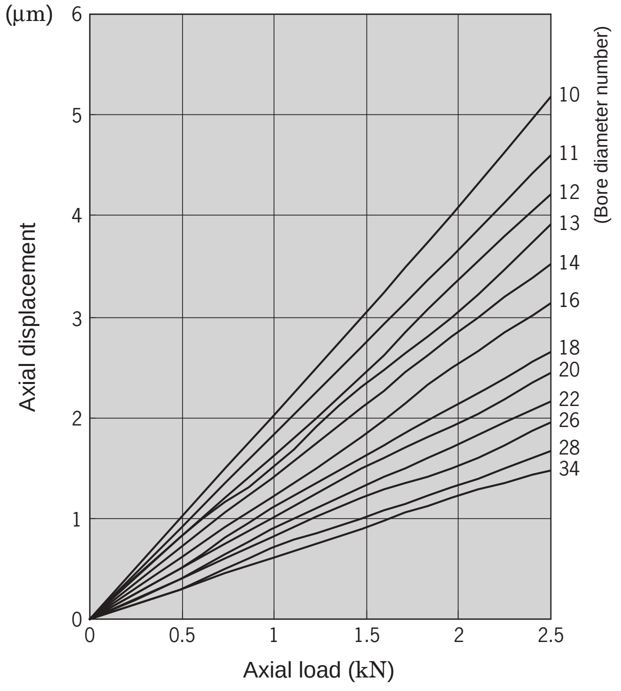


Fig. 3. 1(2) Relationships between axial load and displacement (high-speed matched pair angular contact ball bearings)

[Notes] 1) The small bore diameter type bearing is placed next to the small tapered-bore diameter side of the NN30K, or used in tandem with NN30.
The large bore diameter type bearing is placed next to the large tapered-bore diameter side of NN30K.
2) The dimension E_w is used as a reference for the ball set outside diameter.

[Note] 1) The blue bearing numbers indicate recommended products.

[Remark] 1) This bearing is interchangeable with 234400B as their bore and outside diameters are the same.

4. Tapered Roller Bearings

Contents

4. Tapered roller bearings

The tapered roller bearing is a bearing in which tapered rollers (truncated conical rollers) are inserted between the outer ring and inner ring. The rollers are guided by the inner ring back face rib (see **Fig. 4. 1**).

A radial load and an axial load can be simultaneously applied to the tapered roller bearing. This bearing has high rigidity.

In addition, tapered roller bearings allow easy adjustments of preload.

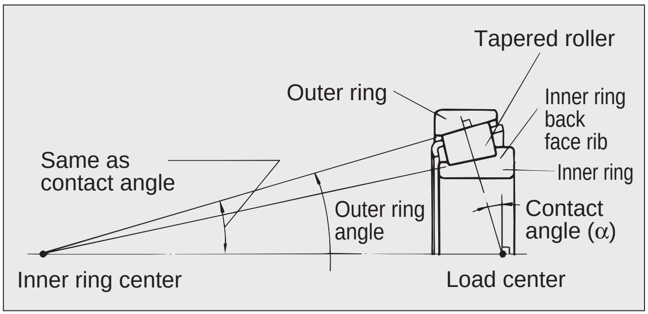

Fig. 4. 1 Structure of tapered roller bearing

Since the single row tapered roller bearing can receive only a unidirectional axial load, a pair of single row bearings are mounted apart and facing each other, or they are often used in a face-to-face or back-to-back arrangement.

4. 1 Types and features of tapered roller bearings

Two types of tapered roller bearings are available for machine tools: the single row tapered roller bearing (auxiliary symbol: JR) and the tapered roller bearing with flanged outer ring (auxiliary symbol: B) (see **Table 4. 1**).

Table 4. 1 Types and features of tapered roller bearings for machine tools

Types	Features
Tapered roller bearing with J designation  ISO sub-unit specifications	Bearings whose basic numbers are followed by "J" are made to the ISO sub-unit specifications. Consequently, inner ring assembles and outer rings, if given the same bearing number, are interchangeable on an international level. Reference: The symbol R denotes high load capacity bearings.
Tapered roller bearing with flanged outer ring 	This bearing allows easy positioning in axial direction using a simple housing structure.

4. 2 Composition of bearing numbers (metric series tapered roller bearings)

30215JRBP5

Tapered roller bearing — 3

Dimension series symbols — 02
29 : dimension series 29
20 : dimension series 20
02 : dimension series 02
22 : dimension series 22

Bore diameter number — 15
15 : nominal bore diameter 75 mm
(Bore diameter number × 5 equals nominal bore diameter.)

Designed to ISO sub-unit — J

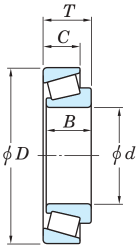
High load capacity bearing — R

Outer ring shape symbols — B
B : flanged outer ring
No specified : standard type

Tolerance class symbols — P5
P5 : JIS class 5
P4 : JIS class 4

4. 3　Tolerance of tapered roller bearings

The tolerance of the tapered roller bearing is compliant with permissible dimensional deviations and limits of classes 5 and 4 as specified in JIS B 1514 for tapered roller bearings.
Permissible dimensional deviations and limits to tapered roller bearings are shown in **Table 4. 2**.



d : nominal bore diameter
D : nominal outside diameter
B : nominal inner ring width
C : nominal outer ring width
T : nominal bearing width

Table 4. 2　Permissible dimensional deviations and limits to metric tapered roller bearings

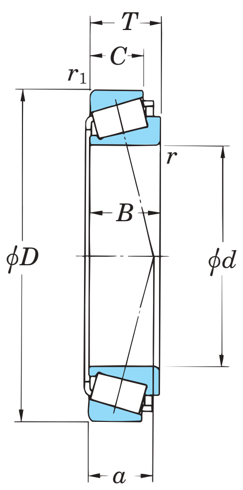
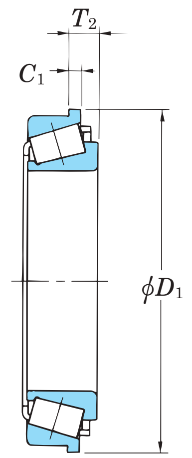
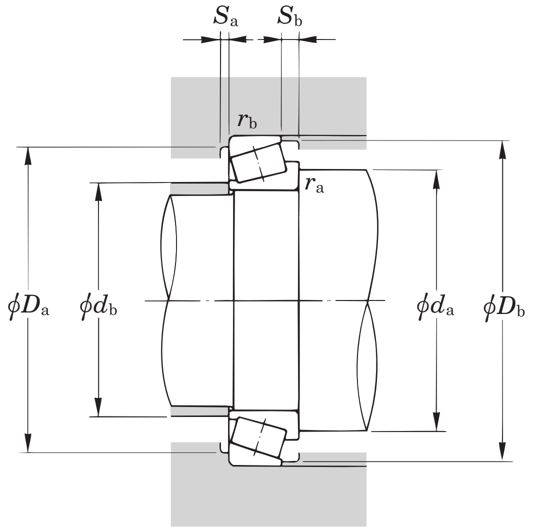
[Note] 1) The bearing number of a tapered roller bearing with a flanged outer ring contains the auxiliary symbol B.
Example 30203JRB

32000JR



32000JRB





Dynamic equivalent load $P=XF_r+YF_a$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	Y_1

Static equivalent load $P_0=0.5F_r+Y_0F_a$

Note that if $P_0<F_r$, it is assumed that $P_0=F_r$.

For e, Y_1, and Y_0, use values given in the table.

5. Support Bearings and Support Bearing Units for Precision Ball Screws

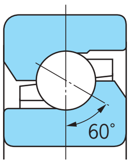
Contents

5. Support bearings and support bearing units for precision ball screws

5. 1 Structure and features

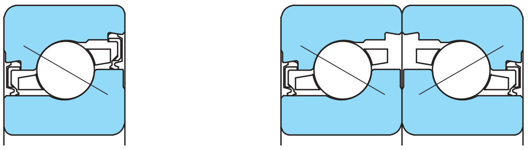
Support bearings for precision ball screws

The SAC type support bearings are angular contact thrust ball bearings specifically for supporting the screw shafts of precision ball screws (see **Fig. 5. 1**).



The bearings supporting the precision ball screws correspond to the type with contact seal.

Consult **JTEKT** for details about the type with contact seal and the pair patterns.



Both-side sealed type

Matching example of one-side sealed type

Fig. 5. 1 Structure of support bearings for precision ball screws

These bearings have many, small-diameter balls and thick section inner and outer rings.

The contact angle of these bearings is 60° enabling a high axial load and a certain degree of radial load to be applied simultaneously.

1) Features of support bearings for precision ball screws

· High rigidity
Has higher rigidity against axial load than conventional standard bearings (see **Fig. 5. 2**).

· Compact and lightweight
Since this bearing eliminates the need for an additional radial bearing or thrust bearing, it allows a compact surrounding design, thereby contributing to a reduction in the weight of the total system.

· High precision
A high-precision bearing suitable for precision ball screws.

· Preload adjustments not required
Preload is preadjusted to ensure an adequate preload after mounting. As a result, complicated adjustments are not required during mounting.

· Low torque
Requires lower friction torque than the tapered roller bearing or thrust roller bearing.

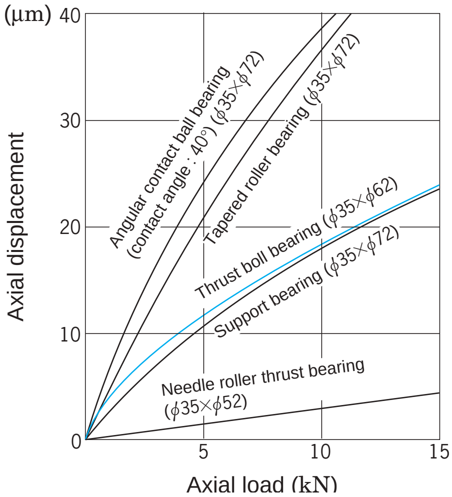


Fig. 5. 2 Relationship between axial load and displacement (comparison between support bearings and other bearings)

*The axial displacements shown above are values of the single-row bearings not preloaded.

2) Matched pair or stack support bearings

Table 5. 1 Types and suffixes of support bearings

	Type and suffix of support bearing	
Combination of two	 Suffix DB	 Suffix DF
Combination of three	 Suffix DFD	
Combination of four	 Suffix DFF	

[Remarks] 1. A "V" mark is put on the outside surfaces of the outer rings of matched pair and stack bearings to indicate their combination type. For handling precautions of the type G bearing, refer to the bearing dimension table "**1. 2 Matched pair angular contact ball bearings.**"
2. Type G bearings are also manufactured, which enable any desired combinations. For descriptions of the type G bearing, refer to the bearing dimension table "**1. 2 Matched pair angular contact ball bearings.**"

Support bearing units for precision ball screws

The support bearing unit for precision ball screws is a unit product combining the SAC type support bearing and a housing machined to a high precision.

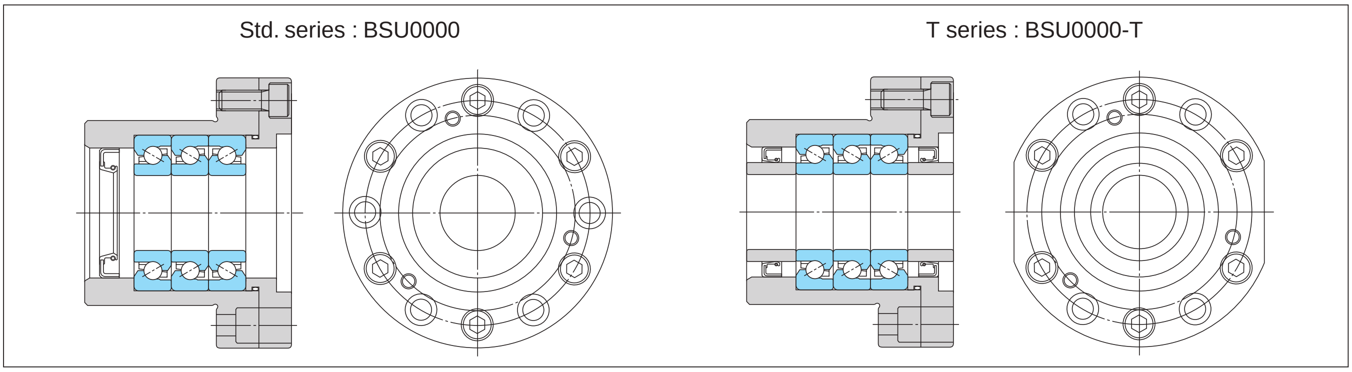

Fig. 5. 3 Series and structures of support bearing units for precision ball screws

1) Types of matched pair or stack bearing

Table 5. 2 Types of matched pair or stack bearing

	Type and symbol
Combination of two bearings	 (Suffix : DF)
Combination of three bearings	 (Suffix : DFD)
Combination of four bearings	 (Suffix : DFF)

2) Features of support bearing units for precision ball screws

- Simple mounting work

This is a unit product consisting of a bearing where the preload is adjusted and an adequate quantity of grease is sealed within the bearing, and is mounted in a compact housing.

Thus the support bearing unit can be easily mounted on a machine.

- Excellent dust-proof performance

Having a high-performance built in oil seal the support bearing unit, with low torque operation, is excellent in dust-proof performance.

- Capability of coping with any desired design

In addition to the standard products listed in the dimension tables, **JTEKT** manufactures support bearing units to meet the support structures of various ball screws.

Consult **JTEKT** for more information.

5. 2 Composition of identification numbers (support bearings and support bearing units for precision ball screws)

Support bearings for precision ball screws

SAC 20 47 B DB MG 4Z

Support bearing for precision ball screws

Nominal bore diameter
20 : 20 mm

Nominal outside diameter
47 : 47 mm

Internal design code

Matched pair or stack symbols
DB : back-to-back
DF : face-to-face
DFD : three bearings making up face-to-face + tandem
DFF : four bearings making up face-to-face + tandem

Cage symbols
MG : molded cage made of polyamide resin

Tolerance class symbols
4Z : **JTEKT** standards class 4 (Equivalent of JIS class 4)
5Z : **JTEKT** standards class 5 (Equivalent of JIS class 5)

[Remark]
Amount of preload is standardized for each matched pair type.

Support bearing units for precision ball screws

BSU 30 62 B DFD –T

Support bearing unit for precision ball screws

Nominal bore diameter
30 : 30 mm

Nominal outside diameter
62 : 62 mm

Internal design code

Matched pair or stack symbols
DF : face-to-face
DFD : three bearings making up face-to-face + tandem
DFF : four bearings making up face-to-face + tandem

Series code
no code : std. series
–T : T series

5. 3 Tolerance of support bearings for precision ball screws

The support bearings for precision ball screws are manufactured to specific **JTEKT** standards suitable for the requirements of precision ball screws (see **Table 5. 3**).

Table 5. 3 Permissible dimensional deviations and limits of support bearings for precision ball screws

(1) Inner ring

Unit : μm

Nominal bore diameter d (mm)		Single plane mean bore diameter deviation Δ_{dmp}				Single bore diameter deviation Δ_{ds}				Single inner ring width deviation Δ_{Bs}		Inner ring width variation V_{Bs}		K_{ia}		Perpendicularity of inner ring face with respect to the bore S_d		S_{ia}

[Notes] 1) The value of the basic dynamic load rating of a single bearing is shown. For those of matched pair and stack bearings, see table below.

2) The identification of a matched bearing is composed of the bearing number of a single row bearing followed by the suffix (DB, DF, etc.).

[Remarks] 1. We recommend a nut axial tension of two to three times the bearing preload.

2. We recommend a retaining plate holding allowance of 0.01 to 0.03 mm.

Ⅱ. Oil / Air Lubrication System

Contents Page

1. Oil / air lubricator

1. 1 Oil / air lubrication

Oil / air is a new method of lubrication, which was developed to prevent atmospheric contamination caused by oil mist leakage, a phenomenon caused by the high speed of the spindles of machine tools combined with oil mist lubrication.

In oil / air lubrication, an extremely small quantity of oil is supplied and sprayed by air pressure directly into the bearings.

JTEKT has produced an oil / air lubricator and an air cleaning unit, for use as a lubrication system.

1) Features of oil / air lubrication

① Ensures a low level of temperature increase and power loss of bearing and enables a high rotation speed.

Supplies the necessary quantity of oil to each bearing in a reliable manner.

② High reliability.

Since new oil is constantly supplied to bearings, the user does not need to be concerned about the service life of the lubrication oil.

Furthermore, compressed air, which increases the internal pressure of the spindle, is effective in preventing dust or cutting fluid from entering from outside.

③ No atmospheric contamination.

A small quantity of oil flows on the surfaces of piping walls controlled by compressed air. This mechanism eliminates atmospheric contamination caused by oil mist leakage from oil mist lubrication.

3) Example of connections of oil / air lubrication system

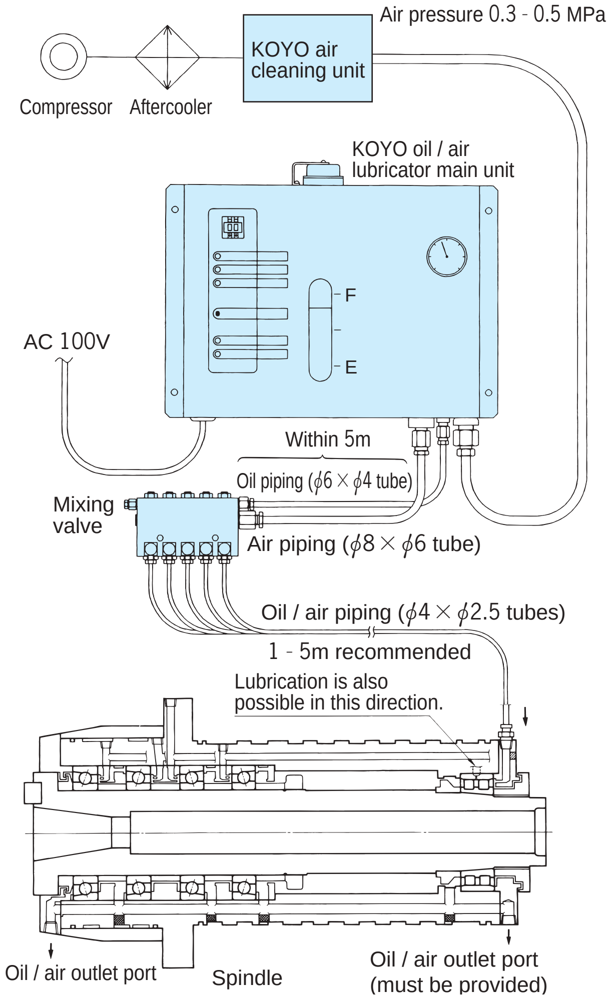

Fig. 1. 2 Example of connections of oil / air lubrication systems

2) System diagram of oil / air lubrication

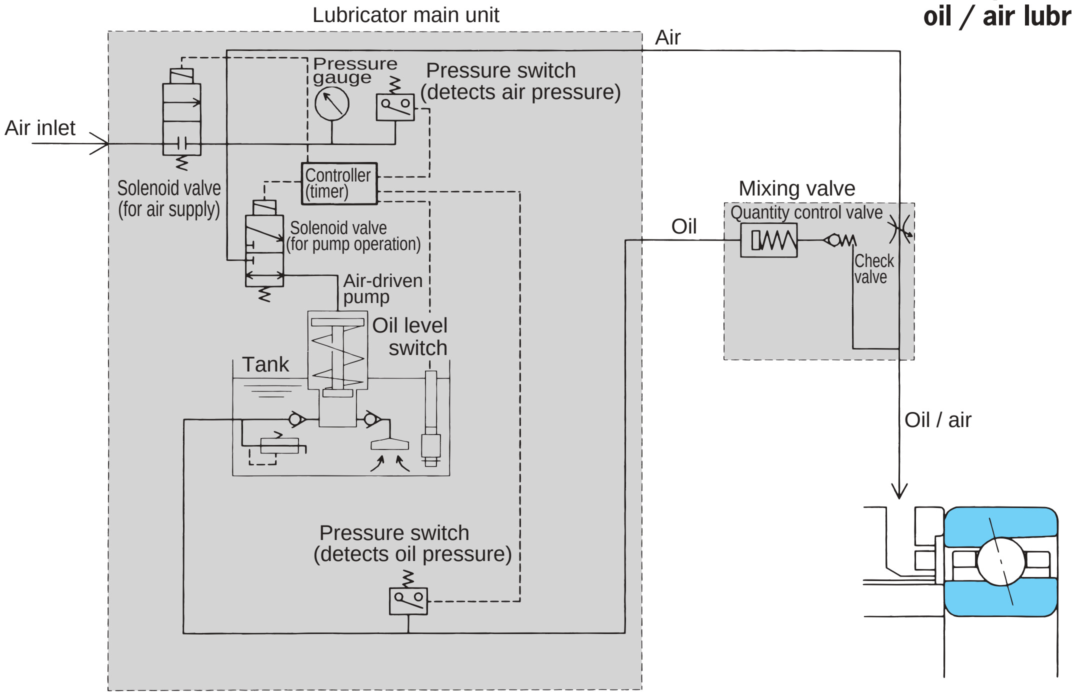

Fig. 1. 1 System diagram of oil / air lubrication

1. 2 Oil / air lubricator

1) Features of KOYO oil / air lubricator

① Lubrication (discharge) intervals can be set to desired values.

The lubricator allows adjustment of lubrication (discharge) intervals from 1 to 99 minutes so that optimum settings for lubrication (discharge) intervals can be selected.

A lock mechanism is provided.

② A solenoid valve used to stop air flow is fitted.

It is included with the standard accessories. The valve stops air flow when the machine body stops. This eliminates the need for valve operation when shutting down the machine when not in use.

③ Oil can be discharged continuously by manual operation.

Before starting oil / air lubricator, the air in the piping must be discharged (air bleed).

The lubricator has a circuit built in that allows a single or a successive 11 round oil discharge by manual operation.

④ A unique safety device is built in.

A level switch is attached to the oil tank, and pressure switches are attached to main oil and air pipes.

In the event of failure of the lubricator, the location of the failure is indicated by a lamp. In addition, an abnormality signal can be output from the abnormality signal contact points (EMG NO-EMGCOM and EMG NC-EMGCOM terminals on the side of the controller).

Mixing valve model number — 1

4B

- Oil discharge quantity symbol (see **Table 1. 1**)
- Number of discharge ports*1) 4 : four B ports

1A

- Oil discharge quantity symbol (see **Table 1. 1**)
- Number of discharge ports*1) 1 : one A port

*1) The standard number of oil discharge ports is 5. As it is changeable, specify according to need. The number of maximum available ports is 8 per block.

Table 1. 1 Symbols of mixing valves and oil discharge quantity

Symbol of mixing valve	Oil discharge quantity (mL/stroke)
A	0.01
B	0.03
C	0.05
D	0.10

For the discharge intervals of the oil / air, refer to **Supplementary table 6** on page 203.

3) Outline drawing and specifications of oil / air lubricator

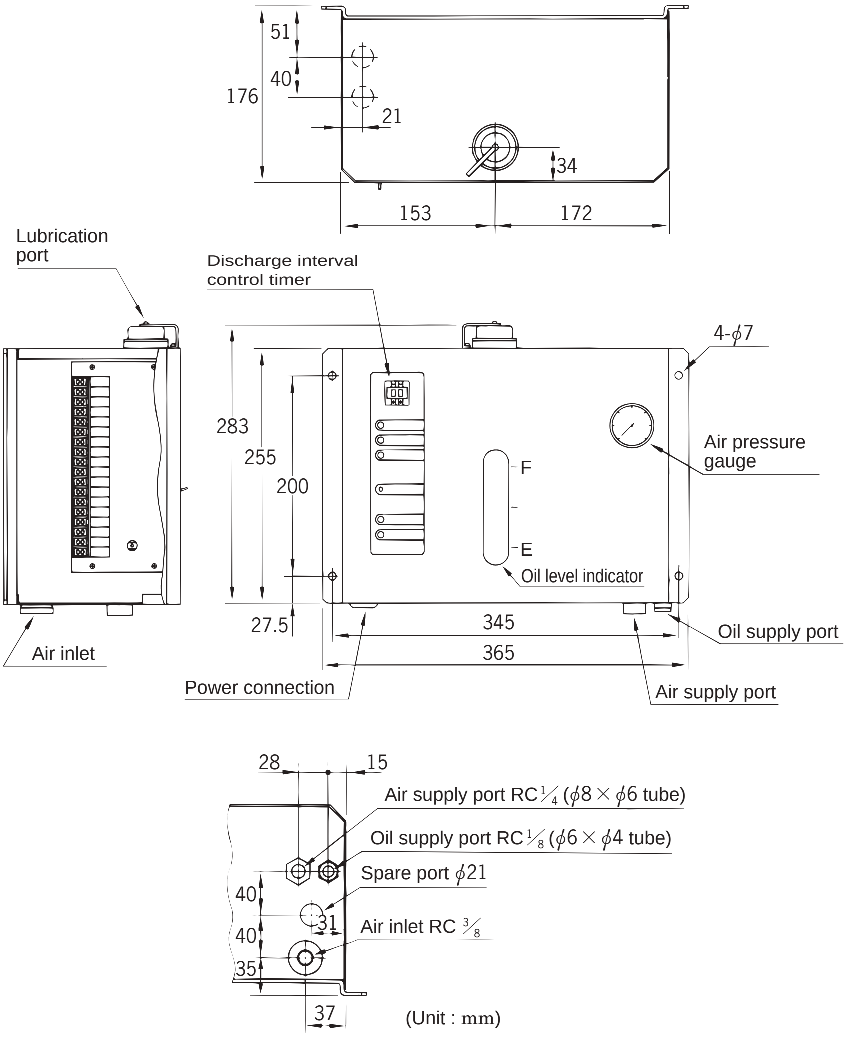

Fig. 1. 3 Outline drawing and specifications of oil / air lubricator

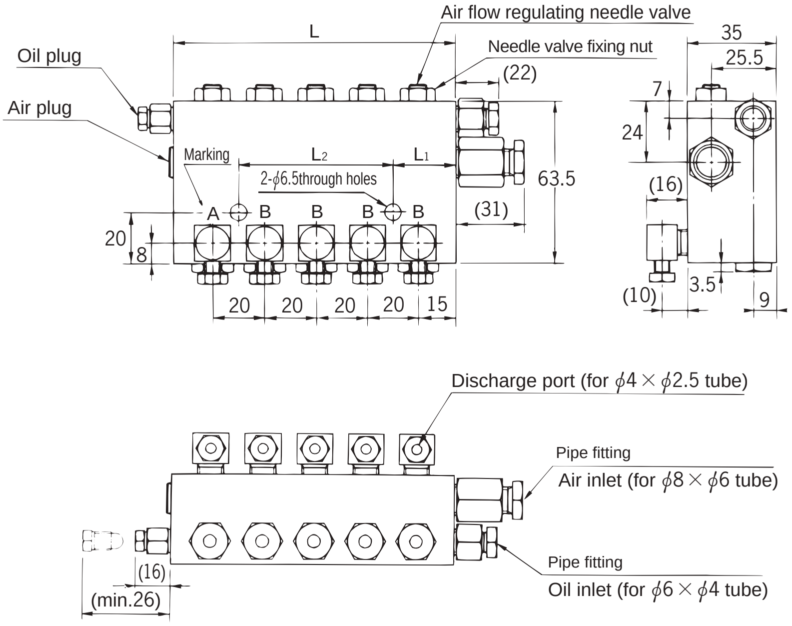
Table 1. 2 Specifications

Item	Specification
Supply voltage	AC100V, 50 / 60Hz
Power consumption	With pump in operation : approx. 20W Pump not in operation : approx. 12W
Service air pressure	0.3-0.5 MPa
Viscosity of oil used	10-100mm^2/s
Lubrication (discharge) intervals	Any desired value between 1 and 99 minutes in one-minute intervals
Tank capacity	1.8L (effective oil quantity : 1.4L)
Capacity of abnormality signal contact points	Contact point a : (EMG NO) 250V AC, 5A 30V DC, 5A Contact point b : (EMG NC) 250V AC, 2A 30V DC, 3A
Mass (refer.)	15 kg

[Note] AC200V is also available. Consult JTEKT.

4) Outline drawing and specifications of mixing valve



(Unit : mm)

Specifications

- The standard number of oil discharge ports is 5. As it is changeable, specify according to need (8 ports per block at maximum).

No. of ports	2	3	4	5	6	7	8
L	50	70	90	110	130	150	170

L_2	40	60	40	60	80	100	120

Fig. 1. 4 Outline drawing of KOYO mixing valve (example of 1A4B-1)

2. Air cleaning unit

Clean, dry air is required for oil / air lubrication, pneumatic bearings, etc.

JTEKT has developed and commercialized the air cleaning unit KAU05, a compact unit consisting of filters, an air dryer, mist separators, and other parts.

This unit efficiently and effectively removes moisture, oil, dust, etc. contained in compressed air.

(Front) (Rear)

■ **KOYO** air cleaning unit KAU05

1) Features of KOYO air cleaning units

① Removes moisture efficiently by refrigerated air dryer.

② Its micro-mist separator removes oil content 99.999 9% and solid foreign matter 0.01μm or greater in particle size.

③ Contains a differential pressure detection switch, which indicates clogging of filter.

In addition, an output signal is obtained from terminals attached on the differential pressure detection switch.

2) Piping system diagram

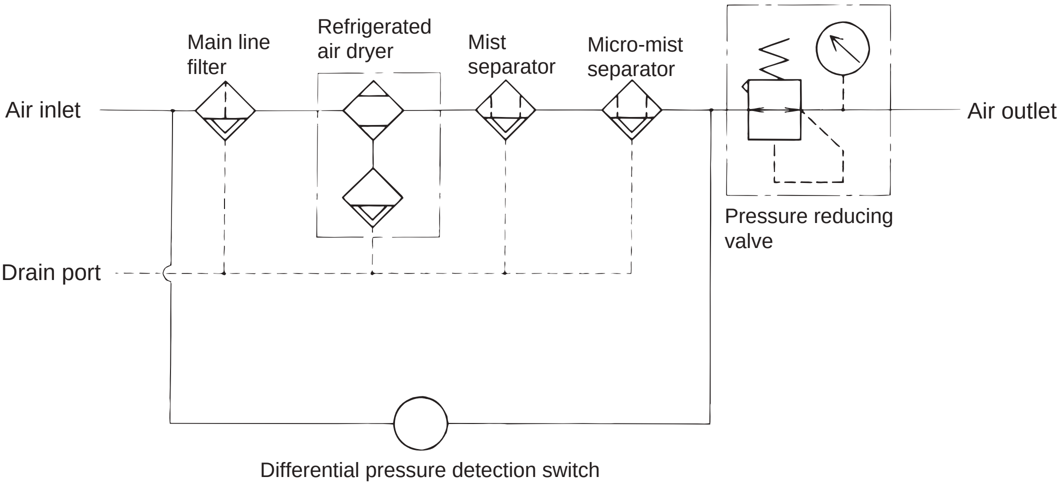

Fig. 2. 1 Piping system diagram of air cleaning unit

3) Outline drawing and specifications of air cleaning unit

Table 2. 1 Specifications of KOYO air cleaning unit KAU05

Item	Specification
Treatment air flow rate	0.52/0.57 m^3/min
Inlet air pressure	0.7 MPa
Maximum temperature of inlet air	50 ℃
Main line filter	3 to 50 μm (95%-arresting particle size)
Mist separator	0.3 μm (95%-arresting particle size)
Micro-mist separator	0.01 μm (95%-arresting particle size)
Oil content separation efficiency	99.999 9%
Solid substance separation efficiency	100% if 0.01 μm or greater
Supply voltage	Single-phase 100 V AC (50/60 Hz)*
Power consumption	180/202 W (50/60 Hz) (at 100 V)
Mass (refer.)	26 kg

*AC 200V is also avilable.

Ⅲ. Handling of Bearings

Contents

Page

1. Handling and mounting of bearings

1. 1 Handling precautions of bearings

1. 1. 1 Handling of bearings

Since ball & roller bearings are made to a higher precision than general mechanical parts, they should be handled carefully.

① Maintain bearings and their surroundings in a clean condition.
② Handle with care.
A severe shock to a bearing by rough handling may result in damage such as flaws, nicks and chipping.
③ Use correct handling tools.
④ Exercise care for rust prevention of bearings.
Avoid handling and storing them in a highly humid atmosphere.
⑤ Bearing should be handled by an experienced person.
⑥ Standard operating procedure for handling bearings should be established.
- Storage of bearings
- Cleaning of bearings and their peripheral parts
- Inspection of dimensions and finish of peripheral parts of bearings
- Mounting
- Dismounting
- Inspection after mounting
- Maintenance and inspection
- Replenishment of lubricant

1. 1. 2 Storage of bearings

Bearings are shipped after a high-quality anticorrosive oil is applied to them followed by a suitable wrapping and packing.

Their quality is guaranteed as long as the wrapping and packing are not damaged.

Bearing, if they are to be stored for a long time, should be stored on a shelf at least 30cm from the ground at 65% or less humidity at a temperature of around 20℃. Avoid direct exposure to sunlight. Keep bearings at a distance from walls.

1. 2 Mounting of bearings

The mounting condition of the bearings affects the accuracy, performance and life of machines.

To optimize the performance of the bearings, it is necessary to strictly follow the procedure and instructions to mount them.

The procedure for mounting the bearings is shown in **Fig. 1. 1**.

In this section, a general procedure for mounting the bearings is described in accordance with the workflow shown in **Fig. 1. 1**.

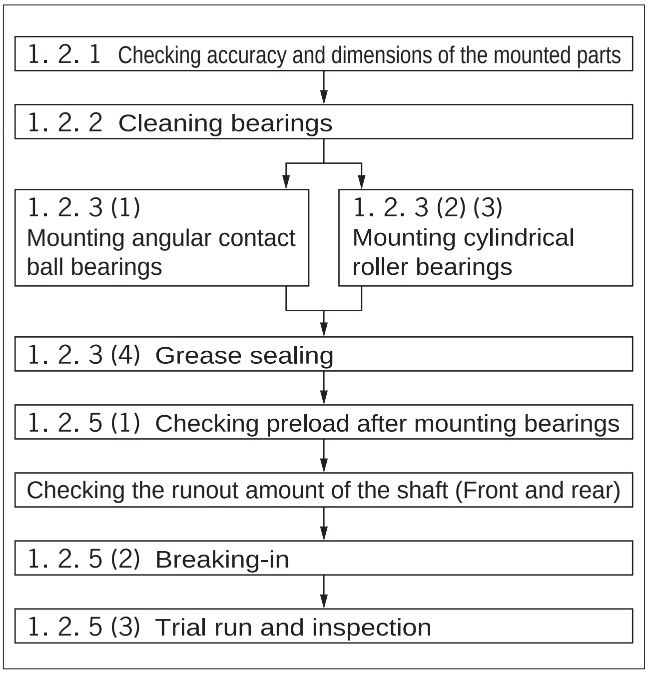

Fig. 1. 1 Mounting workflow

1. 2. 1 Checking dimensions of peripheral parts of bearings

Before mounting the bearing, clean the shaft, housing, spacer, etc. Ensure that the inside of the housing is absolutely free from any residual wrapping material (SiC, Al_2O_3, etc.), molding sand, or chips.

Next, inspect other parts. Check that the dimensions, shapes and roughness are as shown in the drawing, and there is no flaw, burr or barb. Measure the bearing diameter and the bore diameter of the housing at several positions as shown in **Figs. 1. 2** and **1. 3**, and confirm that the fitting is made correctly.

Record the measured values of these parts along with the inspection number of the bearing to be mounted.

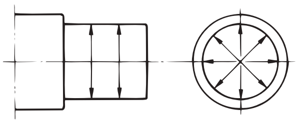

Fig. 1. 2 Measuring positions of shaft diameter

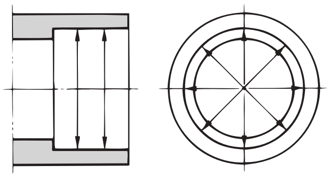

Fig. 1. 3 Measuring positions of housing bore diameter

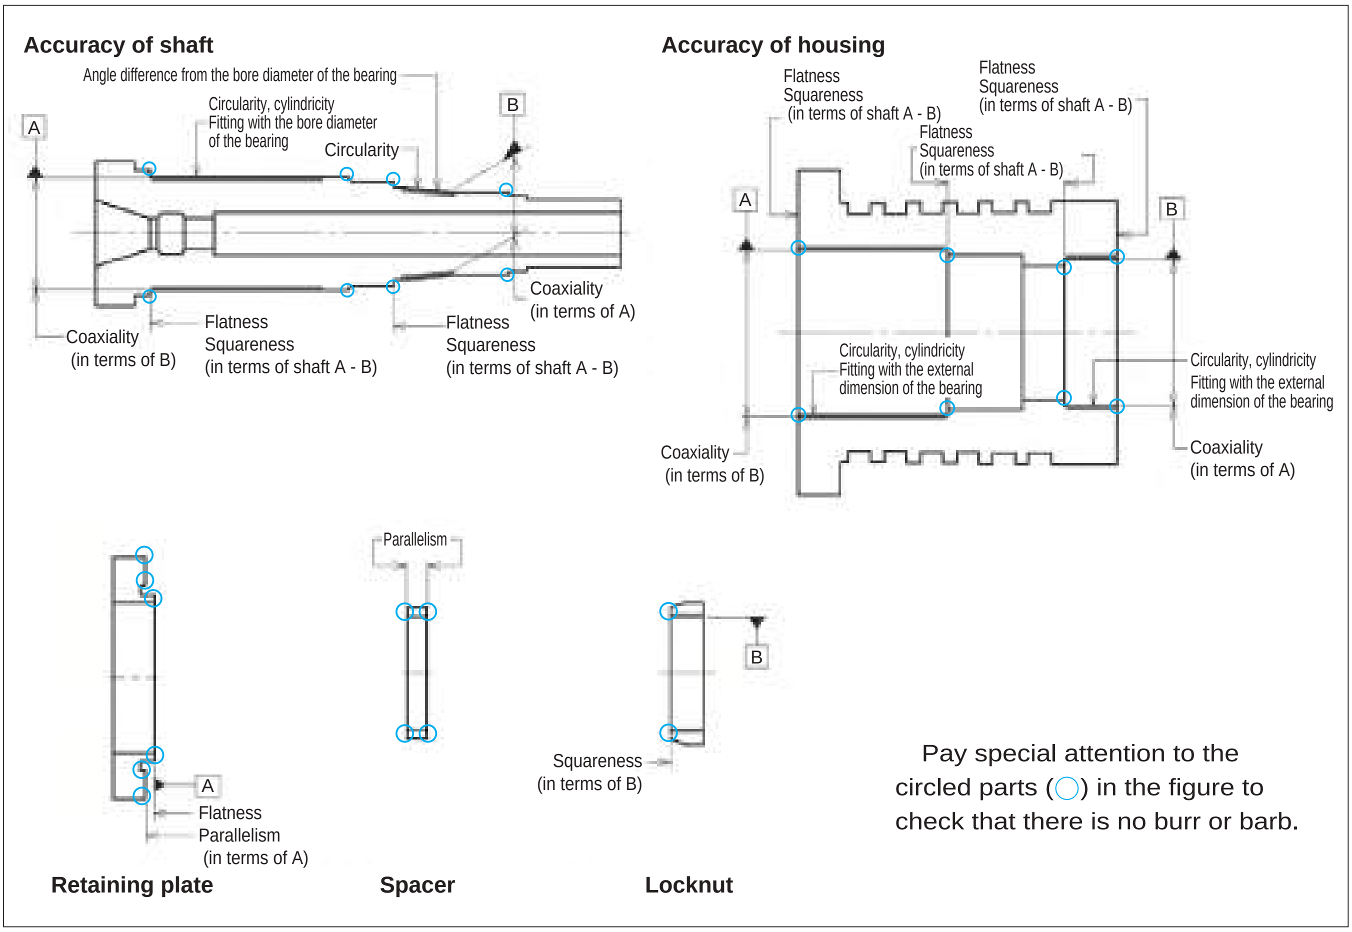
Besides, pay attention to the fillet radii and the squareness of the shoulders of the shaft and housing. (See **Fig. 1. 4**.)

For the tolerances for the shaft diameters and the bore diameters of the housing, refer to **Tables 6. 2** and **6. 3** (on pages 32 and 33) of "**6. Rigidity and preload of bearings**".

Also, for the accuracy of the shaft and housing as well as the fillet radii, refer to "**9. Designing peripheral parts of bearings**" (on page 39).



Pay special attention to the circled parts (○) in the figure to check that there is no burr or barb.

Fig. 1. 4 Points for checking the accuracy

1. 2. 2 Cleaning bearings

After preparing the parts necessary for mounting the bearings, unwrap the bearings just before starting to mount them.

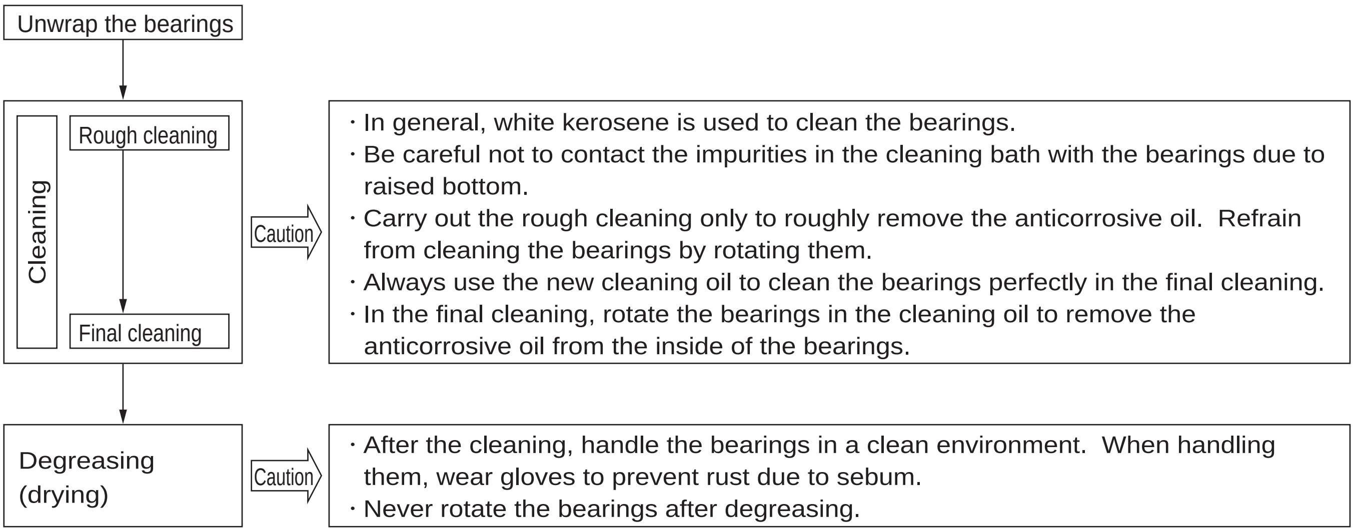
Anticorrosive oil is applied to the bearings to prevent corrosion. After unwrapping the bearings, clean them to remove the anticorrosive oil following the procedure shown in **Fig. 1. 5**.

After cleaning, degrease and dry the bearings. Then, seal grease (in case of grease lubrication) and mount the bearings.

Point

- Be especially careful when cleaning the oil / air lubrication supply and discharge piping, air purge piping, and similar piping.
- After cleaning, ensure that no foreign matter adheres to the piping and store the piping in a clean environment.

<Workflow>



- In general, white kerosene is used to clean the bearings.
- Be careful not to contact the impurities in the cleaning bath with the bearings due to raised bottom.
- Carry out the rough cleaning only to roughly remove the anticorrosive oil. Refrain from cleaning the bearings by rotating them.
- Always use the new cleaning oil to clean the bearings perfectly in the final cleaning.
- In the final cleaning, rotate the bearings in the cleaning oil to remove the anticorrosive oil from the inside of the bearings.

- After the cleaning, handle the bearings in a clean environment. When handling them, wear gloves to prevent rust due to sebum.
- Never rotate the bearings after degreasing.

Point

- Ensure that the bearings are cleaned directly before assembly.
- Never rotate bearings that have been degreased (dried).
- After cleaning, to prevent foreign matter from getting into the bearings, ensure that the bearings are handled in a clean environment.

Fig. 1. 5 Cleaning workflow

1. 2. 3　Mounting bearings

The preparation before mounting the bearings varies depending on the bearing types and lubrication as shown in **Fig. 1. 6**.

For details, see **Fig. 1. 6** to mount the bearings.

In case of the angular contact ball bearings, the fitting mark is indicated on the outside surface of the bearing (see page 59). Mount the bearing in the correct direction referring to the fitting mark.

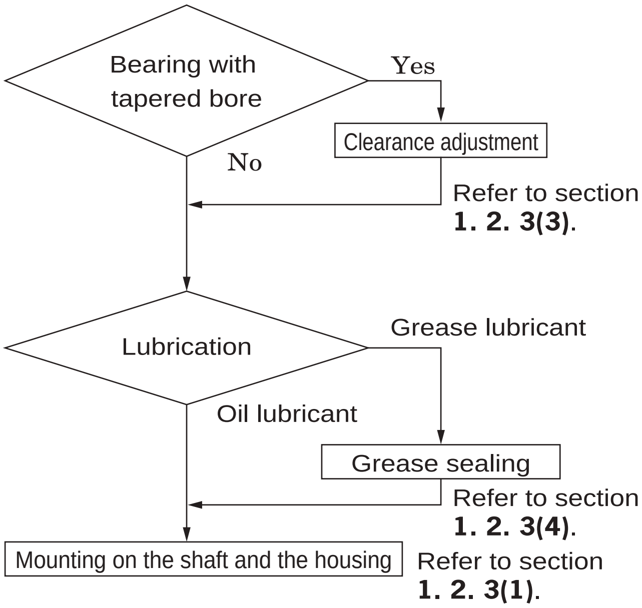


Fig. 1. 6　Preparation before mounting

1. 2. 3(1)　Mounting on shaft and housing

① Bearing mounting

Mounting method of the bearings differs depending on types and fitting conditions.

In case of the bearings for machine tool spindles, the inner ring is usually rotated. Therefore, the interference fit is applied for the inner rings, and the clearance fit is applied for the outer rings.

As a method of interference fit, the shrinkage fit is usually applied for the cylindrical bore bearings. In case of the bearings with tapered bore, the inner ring is press fitted in the taper shaft. In this case, the bearing internal clearance needs to be adjusted as described in section **1.2.3(3)** beforehand, because it is necessary to control the radial internal clearance after fitting.

The clearance fit is used to fit the outer ring in the housing. To facilitate the mounting, the housing is heated to expand the bore diameter before mounting the bearing.

The bearing before mounting, which is used for oil lubrication, is very susceptible to flaws, because it is cleaned and degreased and is in metallic contact with a rolling element and raceway. To protect the raceway during the mounting, it is recommended to apply a small quantity of oil used for the machine to be mounted inside the bearing.

●Shrinkage fit

Heat the bearing assembly or inner ring on an induction heater or hot plate to induce expansion before mounting it onto a shaft.

If this method is used, no force is applied to the bearing and operation is carried out in a short time.

When a hot plate is used to heat up a bearing assembly, the use of a jig as shown in **Fig. 1. 7** enables efficient heating of the inner ring.

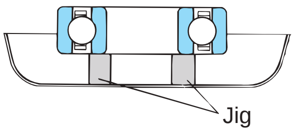

Fig. 1. 7　Inner ring heating jig

Specify the heating temperature of the bearing in accordance with the size and the required expansion, referring to **Fig. 1. 8**. Specify the temperature about 20 to 30℃ higher than the required temperature, taking into consideration the temperature to be reduced during the operation.

However, never heat the bearing up to 120℃ or more.

After mounting the bearing, shrinkage will occur in the width as the bearing cools off. Therefore, fit the inner ring and the shoulder firmly using a locknut to prevent clearance between them.

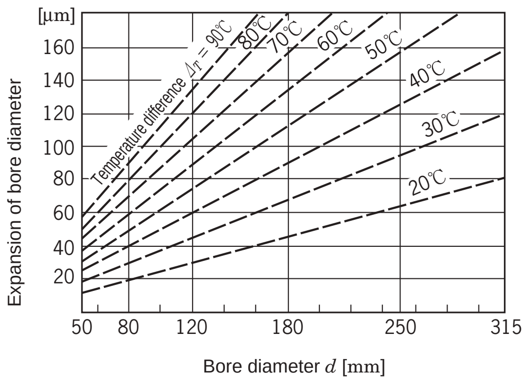

Fig. 1. 8　Heating temperature and expansion of inner rings

●Press fit

Be sure to use the specific jig to mount the inner ring to the shaft and the outer ring to the housing. When press fitting the inner ring and the outer ring, hold only the inner ring and the outer ring, respectively, and apply gently uniform pressure to the whole circumference surface.

Never mount the rings using hammer.

To facilitate the mounting, it is recommended to apply a small quantity of lubricant to the shaft or housing before press fitting.

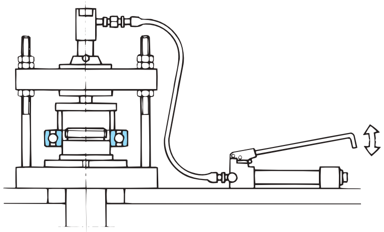

Fig. 1. 9 Press fitting by pressing machine

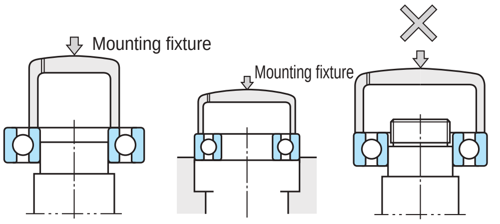
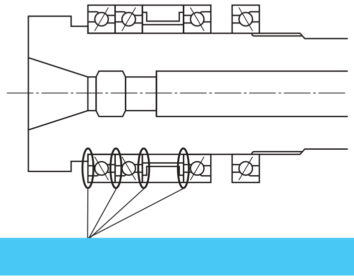


(Inner ring press fit) (Outer ring press fit) (Inner ring press fit)

Fig. 1. 10 Example of press fitting jig



Point

- Ensure that contact is made for each mating surface.
- Take special care to ensure that no foreign matter or the like has been introduced.

Fig. 1. 11 Cautions for bearing assembly

[Reference] Force is necessary to press fit or remove bearings

The force necessary to press fit or remove inner rings of bearings differs depending on the finish of shafts and how much interference the bearings allow. The standard values can be obtained by using the following equations.

(In the case of solid shafts)

$$K_a = 9.8\, f_k \cdot \varDelta_{deff} \cdot B \left(1 - \frac{d^2}{D_i^2}\right) \times 10^3 \quad \cdots\cdots\cdots\cdots (1.\ 1)$$

(In the case of hollow shafts)

$$K_a = 9.8\, f_k \cdot \varDelta_{deff} \cdot B \frac{\left(1 - \frac{d^2}{D_i^2}\right)\left(1 - \frac{d_0^2}{d^2}\right)}{\left(1 - \frac{d_0^2}{D_i^2}\right)} \times 10^3 \quad \cdots\cdots\cdots\cdots (1.\ 2)$$

Where:

K_a : force necessary for press fit or removal N
$\varDelta_{deff}$: effective interference mm
f_k : resistance coefficient
(Coefficient taking into consideration friction between shafts and inner rings ... refer to the table below.)
B : nominal inner ring width mm
d : nominal inner ring bore diameter mm
D_i : average outside diameter of inner ring mm
d_0 : hollow shaft bore diameter mm

Value of resistance coefficient f_k

Conditions	f_k
· Press fitting bearings on to cylindrical shafts	4
· Removing bearings from cylindrical shafts	6
· Press fitting bearings on to tapered shafts or tapered sleeves	5.5
· Removing bearings from tapered shafts or tapered sleeves	4.5
· Press fitting tapered sleeves between shafts and bearings	10
· Removing tapered sleeves from the space between shafts and bearings	11

② Tightening of bearings

●Tightening of inner ring

As a way of fixing the inner ring to a shaft, a locknut is usually used. **Fig. 1. 12** shows an example of fixing an inner ring using a locknut.

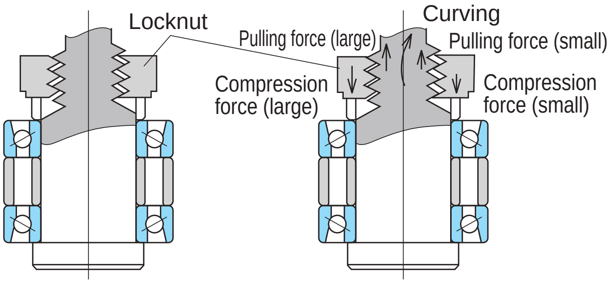


Fig. 1. 12 Example of fixing on inner ring using a locknut

As a clearance is present between thread of the locknut and that of the shaft, fixing the inner ring by using a locknut results in the center of the locknut deviating from the center of the shaft. This deviation in turn causes inclination of the inner ring or bending of the shaft.

As a result, the running accuracy of the shaft is decreased or an abnomal temperature increase is experienced due to the high load applied to the bearing (see **Fig. 1. 13**).

To settle this problem, positioning (centering) of the locknut is necessary after tightening.

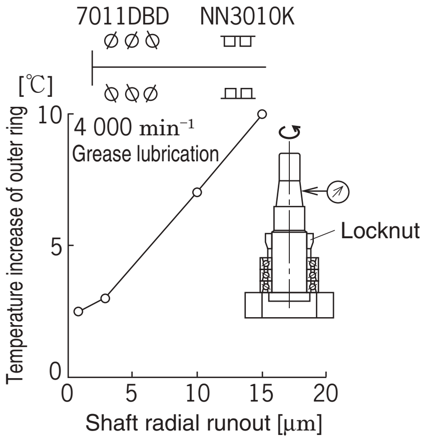

Fig. 1. 13 Relationship between shaft radial runout and temperature increase of the outer ring caused by the faulty positioning of the inner ring

Furthermore, the axial force generated by tightening the locknut leads to compressive strain of the inner ring and inner ring spacer, which in the case of position preloading, influence the amount of preload applied to the bearing.

For those applications which are considerably affected by preload, such as a high-speed spindle, this compressive strain should be taken into consideration. Consideration to other types of bearing supports are the inclination of inner rings, bending of shafts, and axial forces. In cases where a interference fit sleeve is used to fix a bearing, the tolerance of the sleeve is of vital importance since positioning becomes difficult once the bearing is fitted.

Tightening forces (shaft forces) of the locknuts or sleeves used to fix the inner rings are indicated as standard values in the bearing dimension table.

Note that if the interference of inner ring is large and the number of bearing rows is large, the press fitting force also becomes large.

●Tightening of outer rings

Outer rings are fixed to the housing usually by means of a retaining plate.

The retaining plate is fastened to the housing with several bolts. Inadvertent fastening of the retaining plate, however, may result in an inclination and / or deformation of the outer ring.

If inclination and / or deformation occurs in the outer ring, the rolling elements and the cage cannot rotate properly, possibly causing unusual noise generation.

In order to prevent this, it is necessary to tighten the retaining plate fastening bolts with an even torque in diagonal sequence. The fastening bolts should not be fastened individually to the final torque, but in a step-by-step sequence (see **Fig. 1. 14**).

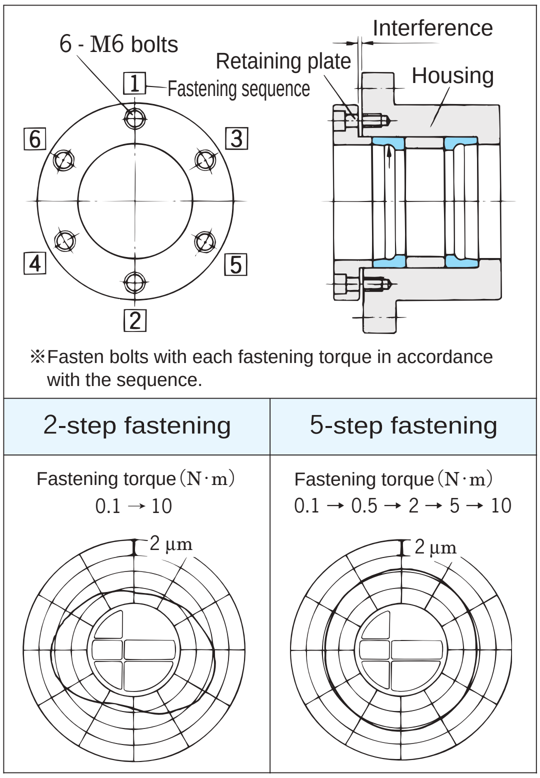

Fig. 1. 14 Raceway roundness variations with respect to the various fastening method

A slight interference is provided between the housing and retaining plate to hold the outer ring firmly.

If variations on the interference exist on the circumference due to poor tolerance of the retaining plate or housing, fastening the retaining plate may cause inclination of the outer ring.

When securing the outer ring using the retaining plate, if the interference is excessive, the preload will become less than the set value, increasing the likelihood of the pressing force becoming uneven. In addition, if the interference is insufficient, the preload will become more than the set value, causing the pressing force to be insufficient, thus leading to creeping of the outer ring.

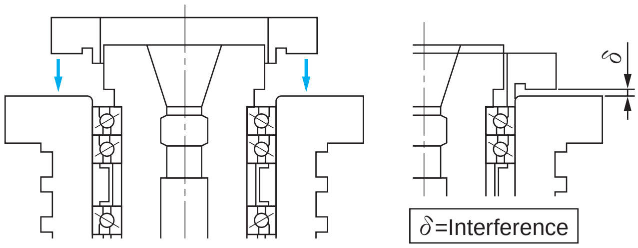

Fig. 1. 15 Interference of retaining plate

Therefore, sufficient care should be taken to ensure tolerance of the retaining plate and housing.

For the interference between the housing and retaining plate, refer to the dimension table for each bearing.

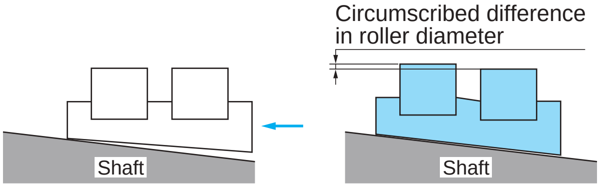
1. 2. 3(2) Management of spindle taper angle

When using cylindrical roller bearings with a tapered bore, the angle of the spindle taper and the angle of the bearing taper must be managed. Managing the taper angles ensures the high precision of the spindle.

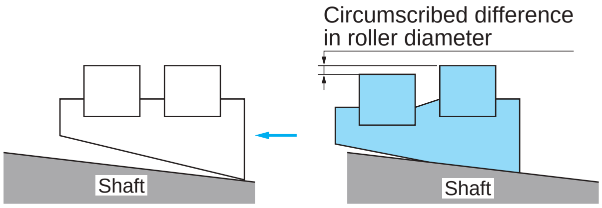
To manage the taper angle, apply a thin coating of blue paste to the bearing bore and check the contact locations with the spindle.

A large difference in the angle between the spindle and the bearing bore will result in an increased difference in the circumscribed roller diameter between two rollers. This may lead to a failure.

☆ If bore taper angle of inner ring is less than shaft taper



☆ If shaft taper is less than bore taper angle of inner ring



Problem details: Increased difference between
circumscribed diameter of rollers

Fig. 1. 16 Example of poor accuracy for tapered hole

1. 2. 3(3) Adjusting of clearance

In case of the cylindrical roller bearing with tapered bore, it is necessary to adjust the dimension of the spacer to adjust the radial clearance of the bearing.

The adjustment is made as follows.

(1) Lightly apply low-viscosity oil (kerosene, etc.) to the taper part of the shaft and fit slightly the inner ring of the cylindrical roller bearing into the shaft (**Fig. 1. 17**).

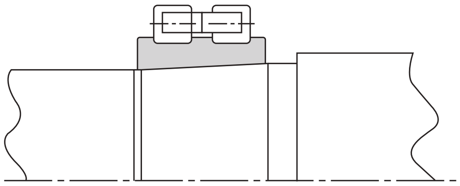


Fig. 1. 17 Temporary mounting of inner ring

(2) Using a block gauge, measure the distance between the end face of the inner ring and that of the shoulder (**Fig. 1. 18**).

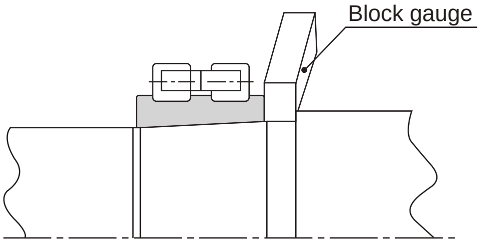

Fig. 1. 18 Width of spacer

(3) Temporarily adjust the width of the spacer.

Adjust the width of the spacer to the distance between the end face of the inner ring and that of the shoulder as measured in step (2). It is recommendable to make the outside diameter of the spacer larger than the diameter of the shaft shoulder to facilitate the pulling-out (Useful when pulling out the inner ring).

Point

- After machining, the parallelism of the lateral spacer sides must be 0.001 mm or less.
- Designing a spacer outer diameter larger than the diameter of the shaft shoulder will facilitate later work.

(4) After degreasing the outside surface and the bore, fit the temporarily adjusted spacer and mount the inner ring onto the shaft.

Be careful not to make clearance between the end face of the spacer and that of the inner ring and clearance between the end face of the spacer and that of the shaft shoulder (**Fig. 1. 19**).

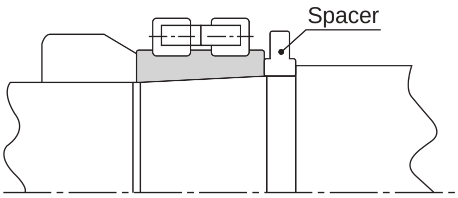

Fig. 1. 19 Mounting of spacer

(5) Place the dial gauge on the outside surface of the outer ring, and move the outer ring upward and downward on the axial line of the dial gauge needle to measure the residual radial internal clearance (**Fig. 1. 20**).

(6) After measurement, pull the bearing and the spacer out of the shaft.

Never hit the bearing to pull it out (Hit gently the end face of the spacer of large outside diameter).

(7) Based on the radial internal clearance measured in step (5), use the equation shown below to calculate the adjustment value of the inner ring to obtain the desired residual radial internal clearance.

In case of taper 1/12,

Adjustment value $\varDelta_A = (R_{sa} - R_{sb} - R_{sc}) \times 12/K$

Where:

R_{sa}: measured radial internal clearance ...... the value measured in step (5)
R_{sb}: desired radial internal clearance
R_{sc}: contraction of the outer ring raceway due to fitting (0 in case of clearance fit)
K : expansion coefficient of the inner ring raceway due to press fitting

Formula to calculate R_{sc}

$$R_{sc} = \varDelta_{Deff}\frac{D_e}{D} \cdot \frac{\left(1 - \dfrac{D^2}{D_h^2}\right)}{\left(1 - \dfrac{D_e^2}{D_h^2}\right)}$$

Formula to calculate K

$$K = \frac{d}{D_i}\frac{\left(1 - \dfrac{d_0^2}{d^2}\right)}{\left(1 - \dfrac{d_0^2}{D_i^2}\right)}$$

Where:

$\varDelta_{Deff}$: effective interference of outer ring
D_h : outside diameter of housing
D_e : outer ring raceway contact diameter
  ball bearing······$D_e \fallingdotseq 0.2\ (4D+d)$
  roller bearing ···$D_e \fallingdotseq 0.25\ (3D+d)$
D : nominal outer ring outside diameter
d : nominal inner ring bore diameter (shaft diameter)
d_0 : bore diameter of hollow shaft
D_i : inner ring raceway contact diameter
  ball bearing······$D_i \fallingdotseq 0.2\ (D+4d)$
  roller bearing ···$D_i \fallingdotseq 0.25\ (D+3d)$

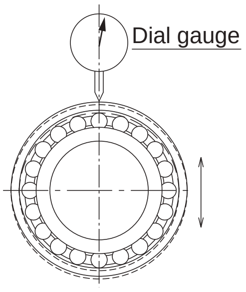

Fig. 1. 20 Measurement of residual radial clearance

Point

- Gently tap the spacer when pulling out the inner ring. Never tap the bearing under any circumstances!

(8) Adjust the width of the spacer.

The width of the spacer must be the value temporarily adjusted minus the adjustment value calculated in step (7).

Point

- After machining, the parallelism of the lateral spacer sides must be 0.001 mm or less.
- After machining, be sure to clean the spacer sufficiently.

(9) After cleaning, mount the bearing and the spacer onto the shaft.

Push inner ring sufficiently so that the end face of the spacer and that of the inner ring as well as the end face of the spacer and that of the shaft shoulder contact each other completely (**Fig. 1. 21**).

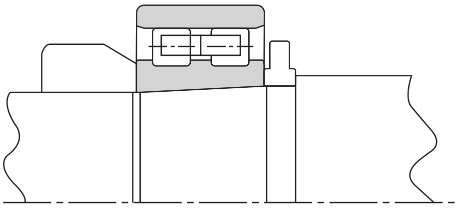

Fig. 1. 21 Mounting of bearing

(10) As in step (5), check the residual radial internal clearance of the bearing.

If the desired value of the radial internal clearance is not obtained, return to step (7) and make adjustment again.

(11) After checking that the desired value of the radial internal clearance in obtained in step (10), pull the bearing and spacer out of the shaft temporarily to clean and degrease them. In case of grease lubrication, seal them with the specified amount of grease, and then reassemble them.

Point

- Make sure that no temperature differences exist between components.
- Ensure proper fitting between the shaft and the bearing bore and between the housing and the bearing outer diameter.
- When using cylindrical roller bearings with a tapered bore, take note of the difference in taper angles of the shaft and the bearing bore.
- Be cautious of burrs and barbs on surfaces in contact with the bearing.

✻Pay special attention to accuracy upon reinstallation following a seizure.

1. 2. 3(4) Grease sealing

If the sealed amount of grease or the sealing method is not appropriate, overheating or instability (**Fig. 1. 22**) may result during breaking-in, and an extended time of breaking-in may become necessary.

Therefore, be sure to seal the bearing with an appropriate amount of grease in correct manner.

Sealing method of grease is described below.

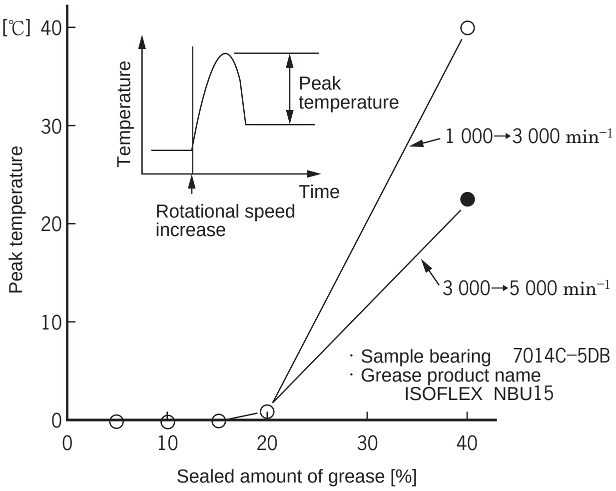

Fig. 1. 22 Relationship between sealed amount of grease and peak temperature

① Preparation before sealing

- Clean and degrease the bearing. And check that there is no stain of anticorrosive oil or foreign matter on the interspace and outer surfaces of the bearing.
- An appropriate amount of grease must be applied uniformly to the specified locations in the bearing. To apply grease, it is recommended to use a specific tool with measuring gauge, which has a nozzle tip.
- The tool used to apply grease also has to be cleaned off and degreased.
- Before applying grease, check the amount of grease to be sealed. The amount should be 10 to 15% of the space capacity of the bearing. (The space capacity of each bearing and the sealed amount of grease are shown in the bearing dimension table.)

② Method for grease sealing

Grease must be applied uniformly to the bearing raceway surface and the retainer guide as shown in **Fig. 1. 23**.

After applying grease, manually rotate the bearing to let the grease spread all over the inside of the bearing.

Also, after applying grease, be careful to prevent foreign matter and dust from adhering to the bearing.

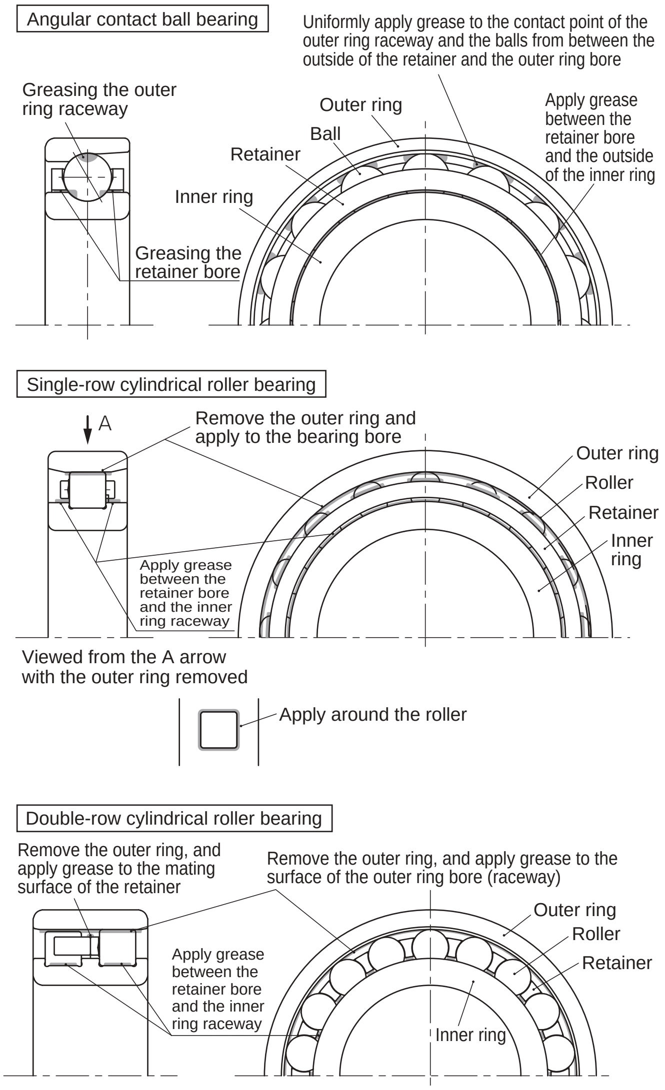

Fig. 1. 23 Grease sealing points

Point

- To apply grease, a tool with a nozzle-like tip similar to a syringe will facilitate work.
- Clean and dry the grease application tool before performing the work.
- Control the amount of grease according to capacity or amount.
- After applying grease, handle the bearing carefully as foreign matter will easily adhere to the bearing.
- Apply the grease evenly and little by little.

1. 2. 4 Mounting of ball screw support bearings

The methods for cleaning parts and applying grease are the same as for spindle bearings. Refer to sections **1. 2. 1 Checking dimensions of peripheral parts of bearings**, **1. 2. 2 Cleaning bearings**, and **1. 2. 3(4) Grease sealing** in **1. Handling and mounting of bearings**.

To use the ball screw support bearings, first create a housing assembly (unit) with the bearings already mounted in the housing.

Refer to “Tightening of outer rings” under **1. 2. 3(1) Mounting on shaft and housing** for how to mount the support bearing to the housing.

Be sure to wash the support bearing assembly part of the ball screw shaft.

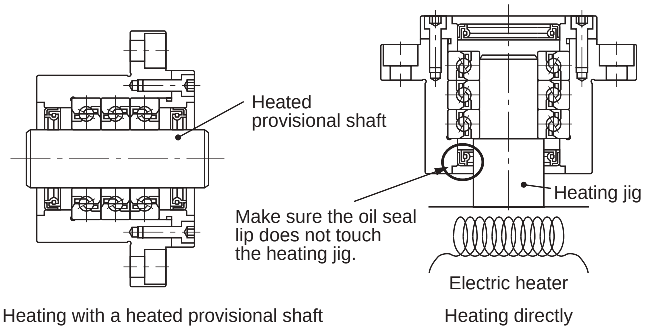
The following section describes the procedure using a unit component as an example.

1. 2. 4(1) Mounting on shaft

The fitting of the inner ring of the ball screw support bearing is what’s referred to as a “transition fit.” Begin by heating the inner ring beforehand (**Fig. 1. 24**).

The inner ring can be heated by inserting a provisional shaft that has been heated into the bore of the inner ring or by directly heating the inner ring using a jig heated using a heater or the like.

When heating the inner ring directly, make sure the unit’s oil seal lip does not touch the heating jig.



Heating with a heated provisional shaft

Heating directly

Fig. 1. 24 Heating the inner ring

1. 2. 4(2) Mounting on the machine body

Once the inner ring has been heated, mount the unit on the ball screw shaft as shown in **Fig. 1. 25**.

Make sure the ball screw shaft has passed through the machine body beforehand.

To mount the unit, insert the inner collar onto the shaft with a clearance fit, and then insert the unit with a heated inner ring onto the shaft.

After inserting the unit onto the shaft, insert the other inner collar onto the shaft with a clearance fit.

Next, tighten the inner ring and the shaft with the shaft nut, and tighten the housing onto the machine body with the bolt.

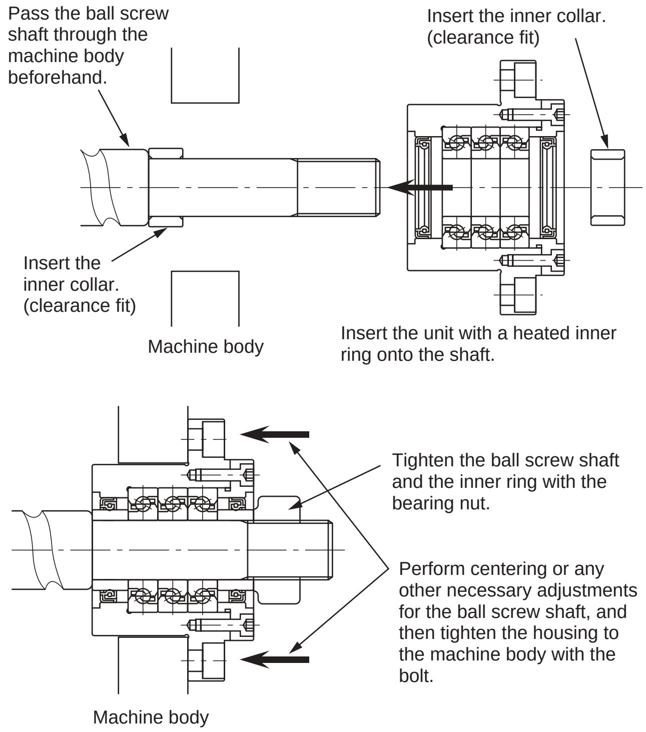


Fig. 1. 25 Mounting of the ball screw support unit

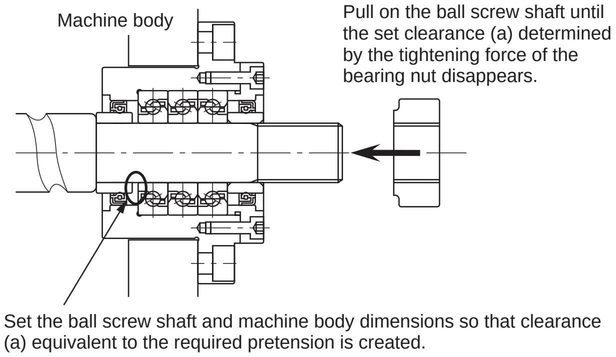
1. 2. 4(3) Applying pretension

The ball screw shaft can be used with pretension applied beforehand.

Fig. 1. 26 shows an example of this method.

After tightening one end of the ball screw, insert the unit at the other end onto the shaft. Set the dimensions of the ball screw and machine body in advance so that an axial clearance equivalent to the necessary pretension is created. When the inner ring and ball screw shaft are tightened using the shaft nut, the set clearance will disappear. The required pretension can be applied to the ball screw shaft by eliminating the clearance.



Point

- After tightening, make sure no residual clearance exists between the shaft shoulder and the inner collar and between the inner collar and the inner ring.

Fig. 1. 26 Applying pretension

1. 2. 5 Check after mounting bearings

1. 2. 5(1) Checking of preload

Preload of the bearing affects its rigidity and heat generation. If the preload is inadequate, not only the standard performance is not obtained, but also the life span is shortened and seizure results.

Therefore, it is important to check that the specified preload is applied to the bearing after completing the mounting of the bearing.

In this section, the following methods for checking the preload, which are generally used, are described.

① Check using the starting torque

If the preload of the bearing becomes large, the starting torque also tends to increases. Therefore, the preload can be checked by measuring the starting torque value.

Wind the thread on the shaft or the outer ring and fix it. By pulling the thread tangentially, measure the tension of the thread when the bearing starts to rotate using a tension gauge, etc. After obtaining the starting torque, the preload can be presumed referring to the correlation between the starting torque and the preload (**Fig. 1.27**).

The starting torque can be measured easily. However, in case of the bearings used with low preload (e.g. angular contact ball bearing used as a spindle), the measurement error can be large because the starting torque is small. This method is recommendable when using the ball screw support bearings by applying heavy preload to them.

Note that it is necessary to standardize the sampling and measurement conditions because the condition of the lubricant and pulling speed affect the measurement result.

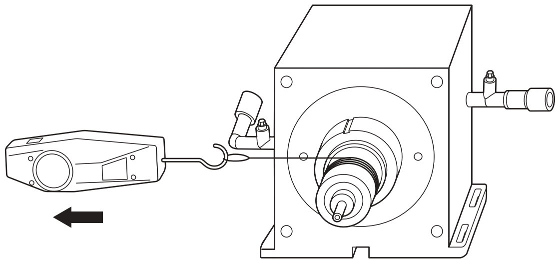


Fig. 1. 27 Measuring starting torque

② Check using the axial rigidity

The preload is confirmed referring to the correlation between the shaft end axial deviation measured by applying the axial load to the shaft end, and the axial rigidity and the preload (**Fig. 1.28**).

This method is not recommendable when using a main shaft of high rigidity because the deviation is very small.

To use this method, a large-sized facility such as a load applying device is necessary. Also, it is necessary to standardize the sampling and measurement conditions because the parts other than the bearing have elastic deformability.

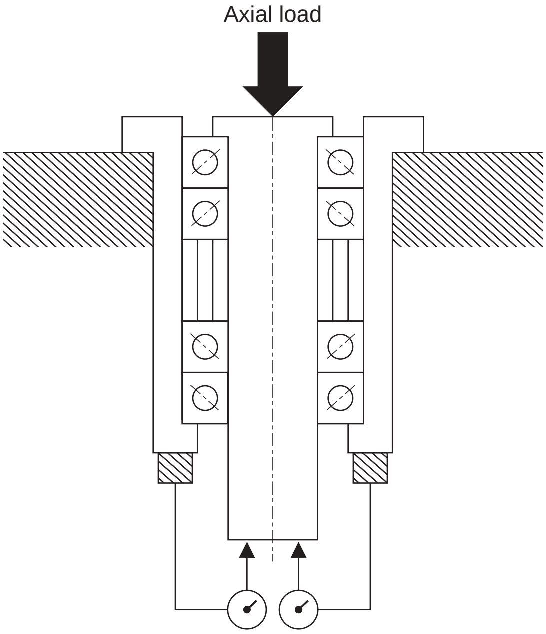

Fig. 1. 28 Measuring axial rigidity

③ Check using the proper vibrations

The preload is confirmed referring to the correlation between the spring constant of the bearing and the preload (**Fig. 1.29**).

This method guarantees accuracy and repeatability of measured values.

However, the fixing method has to be meticulously inspected and standardized because the results are affected by the fixing method.

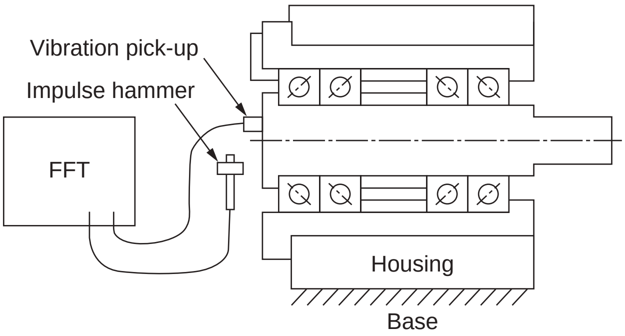

Fig. 1. 29 Measuring eigenfrequency

1. 2. 5(2) Breaking-in

In case of the bearings for grease lubrication, after installation of a bearing, problems are likely to occur due to rapid temperature rise caused by the immediate application of the maximum specified rotational speed. Therefore, breaking-in of the bearing is recommended, in which rotational speed is increased gradually.

Specifically, roller bearings require adequate breaking-in.

Fig. 1. 30 shows an example of breaking-in.

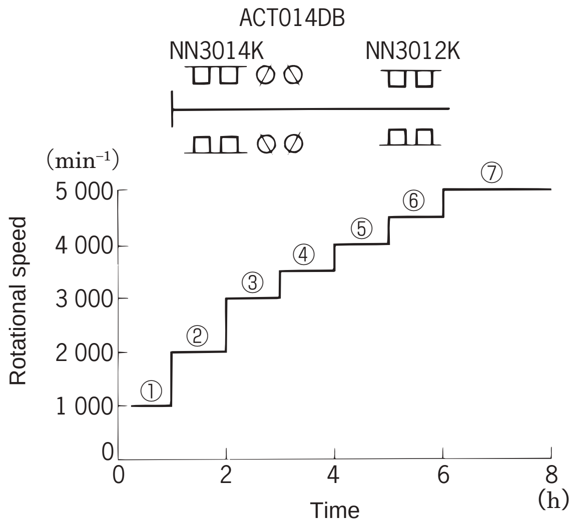

Fig. 1. 30 Example of breaking-in (In case of 5 000 min^{-1} max. speed)

If carrying out the break-in, after increasing the rotational speed, wait until the temperature of the bearing stops to increase or starts to decrease. Then, increase the rotational speed further. (Refer to **Fig.1.31**.)

Never increase the rotational speed when the temperature of the bearing is increasing.

The higher the temperature of the bearing becomes, the faster the grease deteriorates. Therefore, it is important to monitor the temperature during the breaking-in. When the temperature reaches a certain level, stop the operation temporarily. After the bearing cools off, resume the break-in starting from the rotational speed at which the operation was stopped or lower.

If the temperature is measured on the outside surface of the housing or retaining plate, the temperature at which the operation should be stopped is the room temperature plus 30 to 40℃ (Supposing that the room temperature is 15 to 25℃).

The break-in is not required for the bearings lubricated with oil. However, if the bearings are used for the first time or after stored for an extended period of time, it is recommended to carry out the break-in because an abrupt increase of temperature may be expected due to the oil remaining in the lubrication duct and the inside of the bearing (excessive oil quantity).

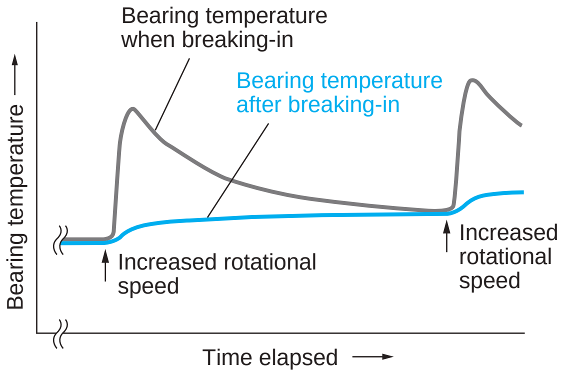

Fig. 1. 31 Bearing temperature increase before and after breaking-in

Point

- · The breaking-in pattern should be based on a pattern of increased rotational speed ⇒ temperature equilibration ⇒ increased rotational speed.
- · Set the amount of the rotational speed increase to be smaller than the maximum rotational speed of the vicinity.
- · Even oil lubrication is affected by initial lubrication. Therefore, we recommend that you perform breaking-in.

1. 2. 5(3) Trial run and inspection

A trial run and inspection are carried out when bearings have been mounted, in order to check whether the mounting is adequate.

In the case of a small spindle, the rotation condition is examined initially by rotating it manually. After confirming that the below conditions do not exist, a further inspection is carried out by a powered run.

· Unsmoothness	Possible causes include the inserfion of foreign matter and flaws on the rolling surfaces. Grease used in grease lubrication may cause a phenomenon of unsmoothness at the initial stage. In such cases, unsmoothness disappears after breaking-in.
· Excessive torque (heavy)	Possible causes are friction in the sealing device, insufficient clearance, etc.
· Uneven rotational torque	Possible causes are difective mounting, and / or errors in mounting dimensions.

In the case of a large spindle that cannot be rotated manually, start it under unloaded condition and immediately after starting, turn the power off and allow to coast.

After verifying that the shaft is free of abnormal vibration or noise and rotates smoothly, proceed to powered run.

Powered run should be started with no load applied and at a low speed, before being increased gradually to a given condition.

Noise, temperature increase, and vibration are principal judging factors in powered run and inspection. If a faulty condition such as shown in **Tables 1. 1** and **1. 2** occurs, conduct a further inspection immediately.

In some cases, it is necessary to remove the bearing for inspection.

Table 1. 1 Bearing noises, causes, and countermeasures

Noise types		Causes	Countermeasures
Cyclic	Flaw noise (similar to noise when punching a rivet1)) Brinelling noise (unclear siren-line noise1))	Flaw on raceway Brinelling on raceway	Improve mounting procedure, cleaning method and rust preventive method. Replace bearing.
	Flaking noise (similar to a large hammering noise1))	Flaking on raceway	Replace bearing.
Not cyclic	Dirt noise (an irregular sandy noise1))	Insertion of foreign matter	Improve cleaning method, sealing device. Use clean lubricant. Replace bearing.
	Flaw noise, flaking noise	Flaws and flaking on rolling elements	Replace bearing.
	Squeak noise (often heard in cylindrical roller bearing with grease lubrication, especially in winter or at low temperature)	If noise is caused by improper lubrication, a proper lubricant should be selected. In general, however, serious damage will not be caused by an improper lubricant if used continuously.	
Others	Abnormally large metallic sound	Abnormal load Incorrect mounting Insufficient amount of or improper lubricant	Review fitting, clearance. Adjust preload. Improve accuracy in processing and mounting shafts and housings. Improve sealing device. Refill lubricant. Select proper lubricant.

[Note] 1) In case of slow or medium rotation.

Table 1. 2 Causes and countermeasures for abnormal temperature rise

Causes	Countermeasures
Too much lubricant	Reduce lubricant amount
Insufficient lubricant	Refill lubricant
Improper lubricant	Select proper lubricant
Abnormal load	Review fitting and clearance conditions and adjust preload
Improper mounting (excessive friction)	Improve accuracy in processing and mounting shaft and housing. Review fitting. Improve sealing device.

Normally, listening rods are employed for bearing noise inspections. The device, which detects abnormalities through sound vibration, and the system, which utilizes acoustic emission for abnormality detection, are useful for more precise inspection.

In general, bearing temperature can be estimated from housing temperature, but the most accurate method is to measure the temperature of outer rings directly via lubrication holes.

Normally, bearing temperature begins to rise gradually when operation is just starting; and, unless the bearing has some abnormality, the temperature stabilizes within one or two hours.

Therefore, a rapid rise in temperature or unusually high temperature indicates some abnormality.

1. 2. 6 Dismounting of bearings

Dismounting a bearing for reuse or identification of causes of failure should be carried out in a careful manner similar to that of when mounted. Care should be taken to avoid damage to the bearing and other parts.

Specifically, when dismounting a bearing involving an interference, the dismounting process of the bearing should be taken into consideration at the designing stage of the shaft and housing.

It is recommended to make a jig for dismounting where appropriate.

Ⅳ. Examples of Bearing Failures

Contents

Page

1. Bearing failures, causes and countermeasures

It is necessary to carry out the maintenance and inspection to use the machine equipment always in stable conditions.

The bearing is an important part of the machine installation. If the bearing is damaged, the machine may become nonoperating and other inadvertent effects may occur.

Rotation noise, vibrations, temperature and torque are important phenomena to determine the status of the bearing. If any abnormality is perceived in such phenomena, it is necessary to immediately find the cause of the problem and take appropriate measures.

In **Table 1. 1**, bearing failures, possible causes and countermeasures are shown.

Table 1. 1 Bearing failures, causes and countermeasures

Phenomena		Causes	Countermeasures	Notes
Temperature rise	Excessive	Excessively small quantity of lubricant	Check the quantity of the enclosed grease and the oil / air blow. Check that there is no leakage in the oil / air pipe.	Usually this phenomenon is accompanied by metallic noise. Grease may be deteriorated or leaking if this phenomenon occurs during normal operation in case of grease lubrication.
		Excessively large quantity of lubricant	Check the quantity of the enclosed grease and the oil / air blow.	In case of grease lubrication, the breaking-in may be insufficient.
		Angular contact ball bearing: excessive preload Cylindrical roller bearing: excessive negative clearance	Check the bearing axial clearance and mounting conditions.	Refer to case ① (page 189).
		Inadequate mounting precision	Check that there is no misalignment.	If reinstalling the bearing, it is necessary to check the precision of the parts after dismounting it.
		Insufficient cooling	Check the availability of the cooling capacity required.	
		External factors	Check that the belt tension is not excessive, the built-in motor is not heated excessively, and the coupling core is precisely placed.	
		Deterioration of bearing	Replace the bearing.	Usually this phenomenon is accompanied by torque rise.
	Instable	Oil / air lubrication: bad exhaust Grease lubrication: insufficient breaking-in	Check the oil / air exhaust route.	In case of oil / air lubrication, if the oil blows intermittently (irregularly) from the exhaust port, the exhaust (oil drainage) is not carried out correctly.
Noise	Metallic noise	Excessively small quantity of lubricant	Check the quantity of the enclosed grease and the oil / air blow. Check that there is no leakage in the oil / air pipe.	This phenomenon is accompanied by excessive temperature rise. Grease may be deteriorated or leaking if this phenomenon occurs during normal operation in case of grease lubrication.
	Continuous noise	Contact and interference between all rotating parts and all non-rotating parts	Check the conditions of the mounted parts, including the labyrinth.	If this phenomenon occurs during normal operation, it may be the secondary phenomenon of a temporal failure.
		Unbalanced shaft and imprecise rotation	Adjust the shaft balance. Readjust the rotational accuracy.	This phenomenon is accompanied by buzzing noise. If this phenomenon occurs during normal operation, it may be the secondary phenomenon of a temporal failure.
		Rough surface and brinelling of raceway	Replace the bearing in the case of entry of foreign matter, flaking, or excessive load.	Refer to cases ② and ③ (page 189 and 190). If there is no measure taken, this phenomenon may occur repeatedly.
	Intermittent noise	Noise of cages, and slippage because of preload leakage	If the preload is excessively small, check the axial clearance and mounting conditions of the bearing.	
Vibrations		Unbalanced shaft	Adjust the shaft balance. Readjust the rotational accuracy.	
		Excessive radial clearance of cylindrical roller bearing	Check the radial clearance of the bearing. Check the mounting conditions.	In case of the bearing with tapered bore, the shaft nut may be loose. Also, the wear may have worsened.
		Rough surface and brinelling of raceway	Replace the bearing in the case of entry of foreign matter, flaking, or excessive load.	Refer to cases ② and ③ (page 189 and 190).

Case ① Excessive bearing preload

Causes

1) Inadequate fitting

- Excessively large interference fitting of the inner ring
  ⇒Due to the increase of interference of the inner ring and the shaft, the diameter of the raceway expands and the preload increases.
- Excessively small clearance fitting of the outer ring
  ⇒If a temperature difference is generated between the outer ring and the housing, the outer ring is compressed and the diameter of the raceway shrinks, resulting in an increase in preload.

2) Inadequate tightening force of the bearing

- If the tightening force of the inner ring (nut shaft force etc.) is excessively large, the inner ring is deformed in axial direction and the preload increases.

3) Excessive cooling of the housing

- If the outer surface of the housing is excessively cooled, the phenomenon described in item **1)** is generated and the preload increases.

4) Failure in constant-pressure preloading and variable preloading system

- If the outer ring cannot be moved smoothly by the constant-pressure preloading and the preload variable spindle, the same phenomenon as in the case of the position preloading is generated, and an excessive preload is applied to the bearing.

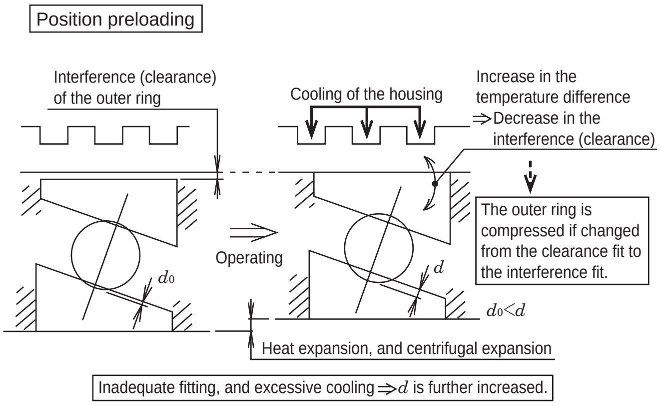

Fig. 1. 1 Cause of increase in preload

Case ② Entry of foreign matter

Major types of foreign matter are as follows.

- Coolant
- Chippings
- Iron chips (housing material)

Causes

1) Poor sealing performance

If the labyrinth is not adequately configured for use conditions, the sufficient sealing effect is not obtained, and foreign matter including coolant, may be trapped in the bearing.

2) Part not cleaned sufficiently

If the parts are not cleaned sufficiently, foreign matter such as small burrs and barbs may exist. This foreign matter may fall into the inside of the bearing during the operation.

3) Dirty lubricant

If the oil lubricant is not completely washed out of the pipe, or if the environment for the enclosing grease is not adequate, foreign matter may be trapped in the lubricant and the bearing may be damaged.

Fig. 1. 2 Example of biting flaws formed in raceway because of entry of foreign matter

Case ③ Damage on the raceway surface (nick and flaking)

Causes

1) Nick

Nick may be produced on the raceway surface if the main shaft is hit, any excessive load is applied to the bearing because of the clamping and unclamping of the tool, or the bearing is not properly handled.

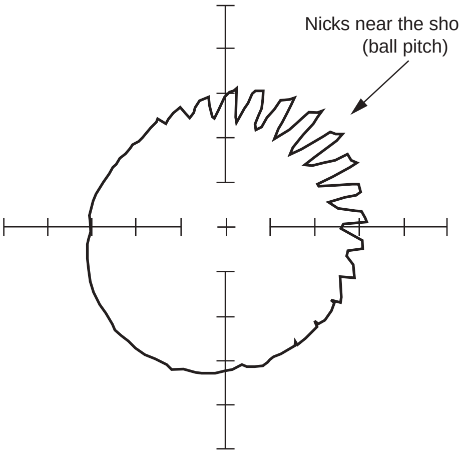

Fig. 1. 3 Example of nicks

2) Flaking

As the bearing becomes old, the flaking occurs if the load is applied repeatedly to the raceway surface.

However, even in case of a new bearing, the flaking may occur if an excessive load is applied to the bearing or the oil film is formed insufficiently.

Also, the flaking may be generated by the brinelling (nicks).

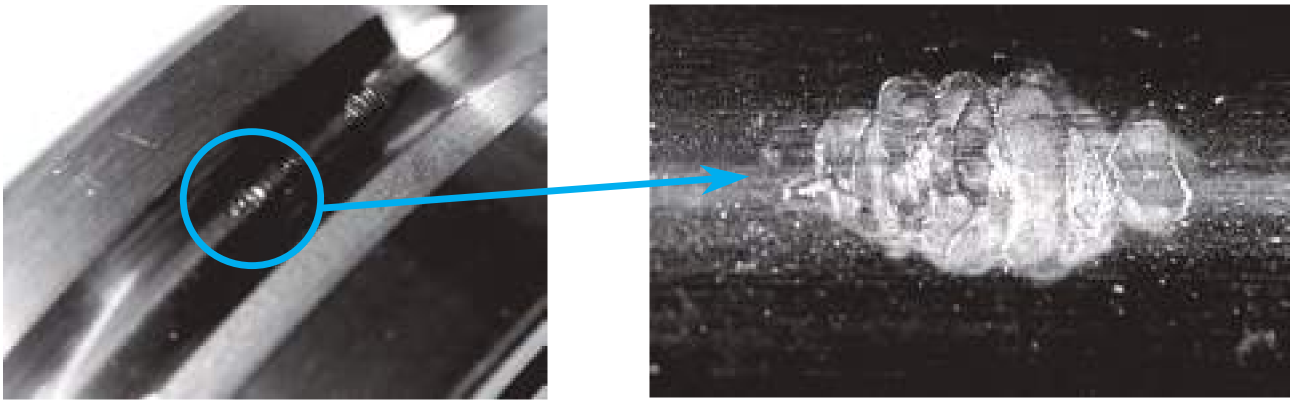

Fig. 1. 4 Example of flaking

</table>

[Remarks]
1. The discharge intervals indicated are reference values supposing that the oil quantity of one discharge is 0.03ml in case of the angular contact ball bearing.
2. If the cylindrical roller bearing is used, suppose that the discharge interval is the same, and the oil quantity of one discharge is 0.01ml.
3. Select the optimal value of the required oil quantity by carrying out the test on the machine referring to the table above, because the optimal value varies depending on the type of the bearing, environment and use conditions.
4. ISO VG22 or VG32 is recommended in case of the main shaft driven by the built-in motor.

Supplementary table 7 Specification report of bearing for main shaft of machine tool

Examination certificate No.

Please fill in the space provided ▭.

＊Please attach the drawings, which show the configuration of the main shaft, dimensions, external load and loading position and direction.

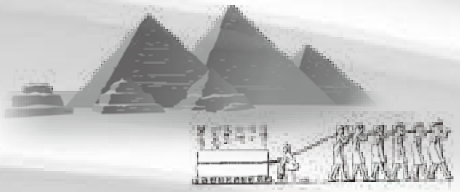
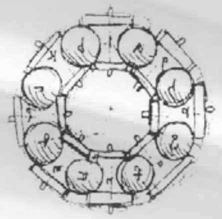
Low-Friction Torque Bearing

LFT-Series

CAT.NO.B1023E





The Evolution of Rolling Bearings

The technology of “moving” and “rolling”
with as little resistance as possible
has evolved since ancient times as an eternal theme,
blossomed as bearing technology and continued to evolve.

Bearings are essential to all industries.
Therefore, reduction of energy loss (torque loss) in bearings through size / weight reduction,
efficiency enhancement, etc. helps reduce CO_2 emissions
across all industries and ultimately
contributes to the prevention of global warming,
which is a reflection of the ancient Japanese saying
“Constant dripping wears away a stone”.

For the future of our planet environment

LFT-Series

Low-Friction Torque

LFT-Series

JTEKT, since its time as Koyo Seiko, has constantly focused on friction and lubrication in efforts to reduce bearing torque and, in the 1980s, successfully developed the world’s first low-torque tapered roller bearing, the LFT. New generations emerged as the product evolved - LFT-II, III and IV, and these have helped to improve the fuel efficiency of automobiles.

Currently, JTEKT applies low-torque technology to other bearing types such as ball bearings and hub units, and offers an extensive LFT bearing lineup.

JTEKT’s LFT-Series of low-torque bearings will continue evolving hereon into the future.

* LFT is an abbreviation for Low-Friction Torque and JTEKT’s registered trademark.

LFT-Series incorporated technologies	TRB-LFT 	BB-LFT 	HUB-LFT 	NRB-LFT 
Lubricant Reduced agitating resistance	○	○	○	○
Reduced in viscous rolling resistance (Bearing ring-rolling element)	○	○	○	○

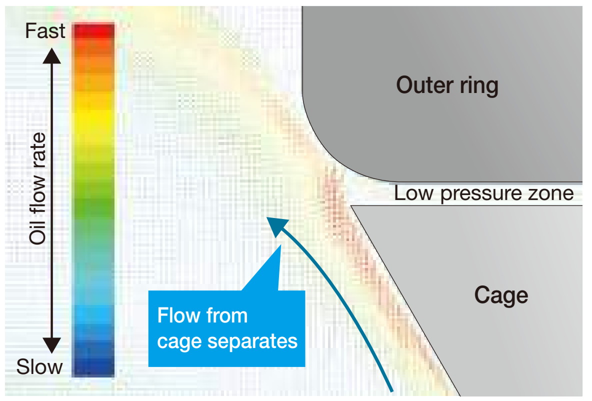
Reduced sliding friction resistance (Roller-cage)	—	—	—	○
Seal Reduced friction resistance	╲	╲	○	╲

Super-Low Friction Torque Tapered Roller Bearing (LFT-IV)

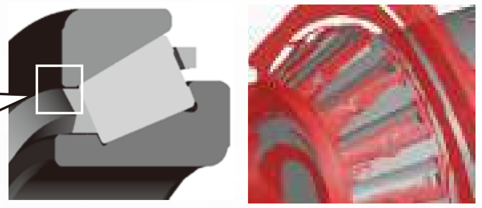
TRB-LFT

Features

In order to optimally control the amount of lubricant that flows through the bearing, this bearing uses resin with a high degree of design freedom for its cage material and has reduced lubricant mixing resistance. Bearing life in contaminated oil has also been improved



Speed vector diagram



<Mechanisms for reducing oil inflow>

- Flow of lubricant in proximity of cage end face separates from cage
- A low pressure zone is generated at lubricant entry point, reducing flow

	LFT-Ⅰ	LFT-Ⅱ	LFT-Ⅲ	LFT-Ⅳ
Evolution of TRB-LFT				
Features	Optimization of shape and roughness at contact portion of rib and roller	Special crowning of inner / outer ring raceways	Controlled volume of oil flow / Optimized internal	Optimal control of oil inflow with a resin cage
Friction torque reduction effect (compared to standard models)	-10% →	-20% →	-50% →	-65%

Major Fields of Application and Effects

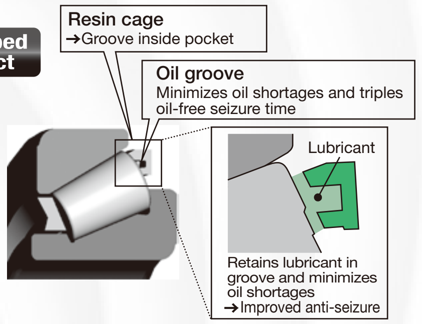
- Used on the pinion support of differential units to improve vehicle fuel efficiency by **2.5**%

Next-generation high performance product

High performance tapered roller bearing with resin cage (improved anti-seizure)

In addition to low-loss through high degree of design freedom using a resin cage and longer life in contaminated oil (LFT-IV), this bearing offers extended oil-free seizure time

Developed product



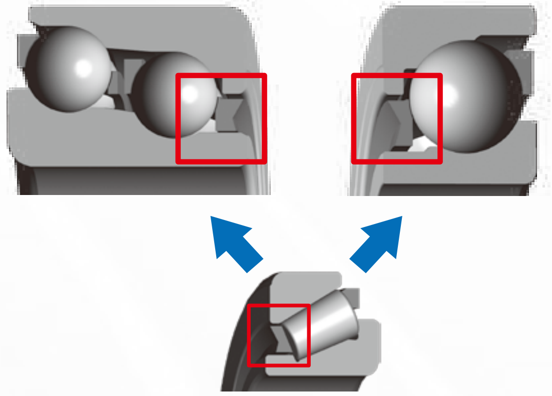
Low-Friction Torque Ball Bearing

BB-LFT

Features

- Horizontal deployment of structure used on super-low friction torque tapered roller bearing to control oil inflow
- By optimizing cage and inner / outer ring shape, oil flow to bearing is restricted and mixing loss is reduced by up to 30% compared to conventional angular contact ball bearings
- Reduced amount of contaminants infiltrating the bearing and improved durability in contaminated oil by 1.5 times

Double row low-friction torque ball bearing for differential pinions



Structure of ultra-low torque tapered roller bearing (LFT-IV) to control oil inflow

Single row low-friction torque ball bearing for differential pinions

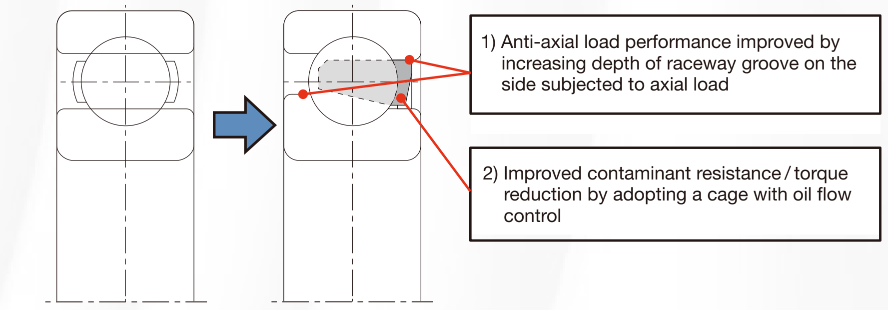
Major Fields of Application and Effects

- Used on the pinion support of differential units to improve vehicle fuel efficiency by **1**%

Next-generation high performance product

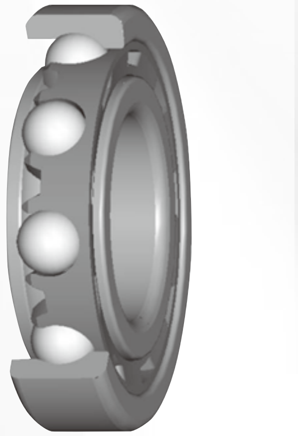
Low-Friction Torque Deep Groove Ball Bearing Supporting High Axial Loads

- 10% smaller outer diameter than conventional deep groove ball bearings and improved anti-axial load
- Compared to tapered roller bearings with equivalent load allowance (JTEKT's LFT-II), torque loss reduced by up to 50%



Current product (standard deep groove ball bearing)

Developed product

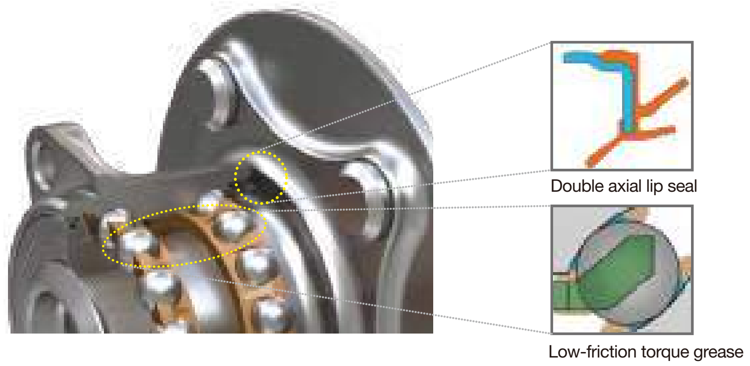


Low-Friction Torque Hub Unit

HUB-LFT

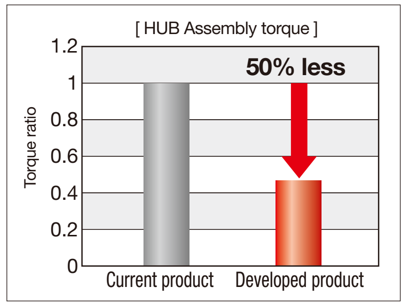
Features

- Optimization of thickener, base oil and additive for hub operating environment, developed new grease achieving the trade-off features of improved bearing life and reduced friction torque
- Adopted a double axial lip seal achieving low-friction torque without adversely affecting sealing performance



Double axial lip seal

Low-friction torque grease



Major Fields of Application and Effects

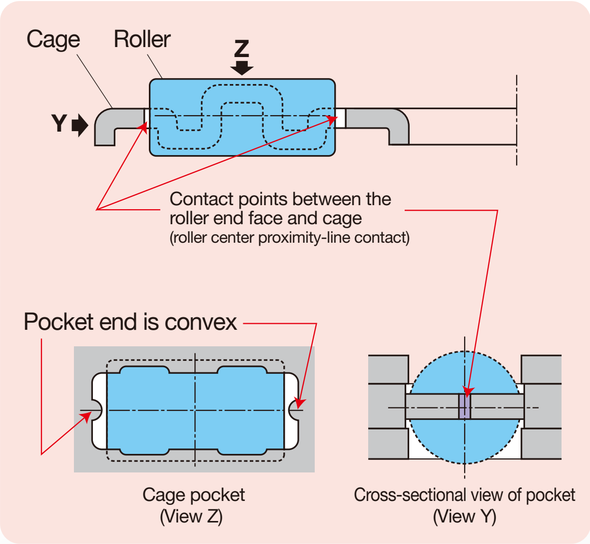
- Used on 4W of vehicles to improve vehicle fuel efficiency by **0.5**%

Low-Friction Torque Needle Roller Thrust Bearing

NRB-LFT

Features

- Reduced sliding resistance between roller end face and cage by optimizing cage shape

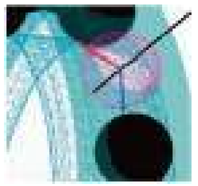


Major Fields of Application and Effects

- Improved vehicle fuel efficiency through adoption on transmission unit (independent friction torque reduction of 50 to 60% depending on conditions)

Base Technology Supporting the LFT-Series

Mechanism analysis

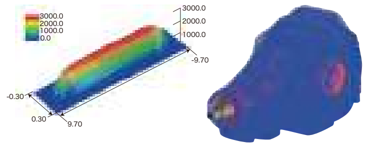


Calculates precise torque by dynamic analysis utilizing a program developed by JTEKT and accounting for ball sliding behavior

Fluid analysis

Analyzes lubricant flow, reduce agitating resistance and reflects results in optimal design

Analysis of axle system



Investigates axis support rigidity, bearing life, surface pressure, etc. for the overall unit then proposes optimal bearings

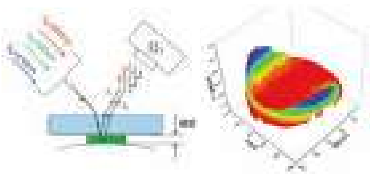
Visualization of oil flow

Simulates lubricant flow under actual operating conditions then proposes low-friction torque bearings

Measuring loss on an actual unit

Evaluation technology that enables accurate detection of torque loss

Oil membrane measurement



Ensure required oil membrane by visualizing oil-membrane state at time of low-friction torque grease and poor lubrication

Actual vehicle evaluation technology

Proving Ground Enables Testing / Evaluations Simulating Roads Worldwide

Fully utilizing our knowledge as a world-leading systems supplier, JTEKT conducts driving evaluations and analyses of products installed in vehicles. We exhaustively pursue the highest standards in product safety and operation on a test course capable of simulating various road and weather conditions of regions around the world. As a total systems supplier, our highest value is to provide our customers with products that deliver outstanding performance and the best quality that help to make automobiles that are more than just fun to drive.

High Wing Series Drive Shafts

JTEKT

JTEKT CORPORATION

JTEKT
Koyo TOYODA

CAT.NO.B2022E

High wing series drive shafts that handle all kinds of environment with proven results, technology, research and development

In order to improve the reliability of our drive shafts under severe conditions, JTEKT has been continuously committed to research and development of technologies, built upon a wealth of results and experiences achieved with our customers over many years.
Our products also have high compatibility through adoption of standard mounting dimensions.
This catalogue includes dimension tables for respective model numbers, technical data, handling and failure cases, which we believe will surely help with design of construction machinery and railway rolling stocks.
We thank you in advance for your support.

CONTENTS

- Introduction to drive shaft

- Efforts to improve reliability

- Technical data

JTEKT products supporting construction machinery and railway rolling stocks

JTEKT deals with severe conditions with its No.1 & Only One technologies.

Our drive shafts for construction machinery and railway rolling stocks to meet your needs

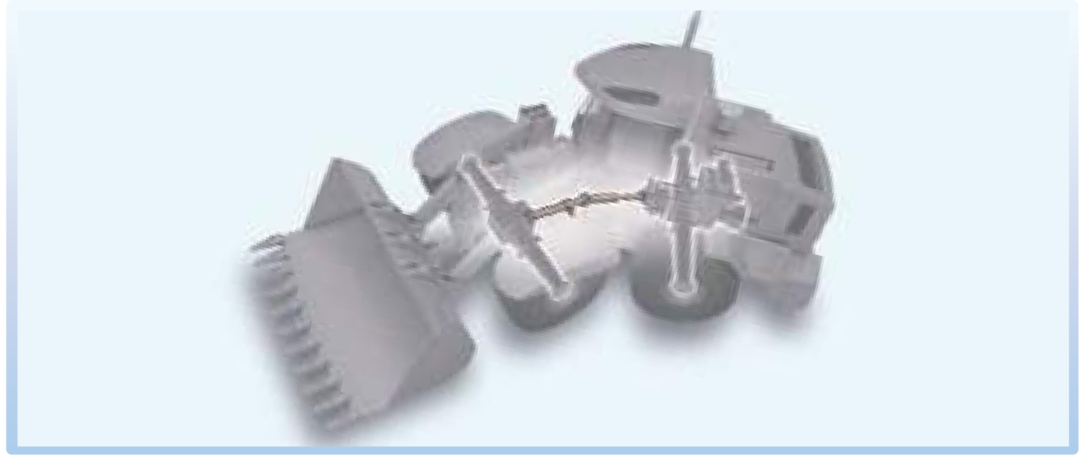
Introduction to drive shafts

Functions

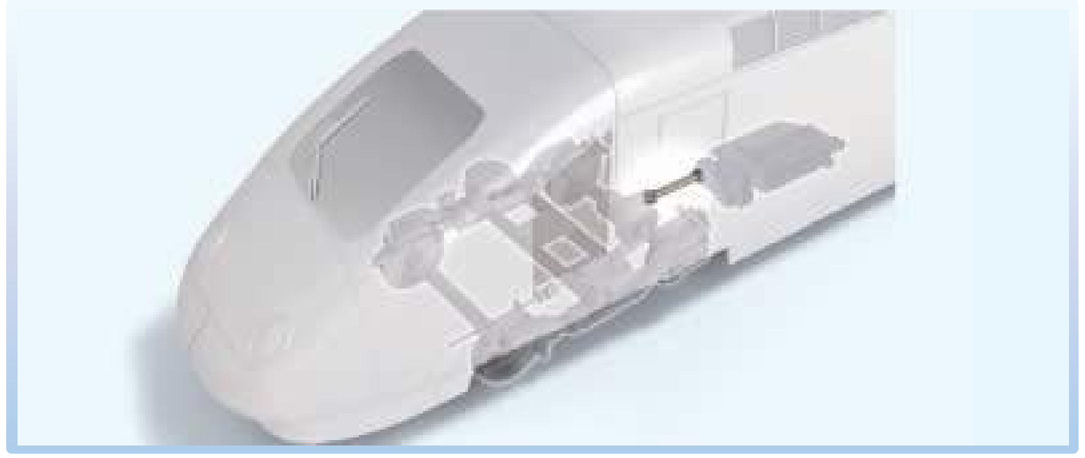
A drive shaft is a device to smoothly transmit rotation torque by connecting a driving shaft and a driven shaft that are not aligned on the same axis. Since it has two universal joints on one shaft, it can connect the driving shaft and the driven shaft flexibly.
In addition, one universal joint has four rolling bearings (cross & bearing) that can minimize torque loss with low friction.

Representative applications of drive shaft

●For wheel loaders

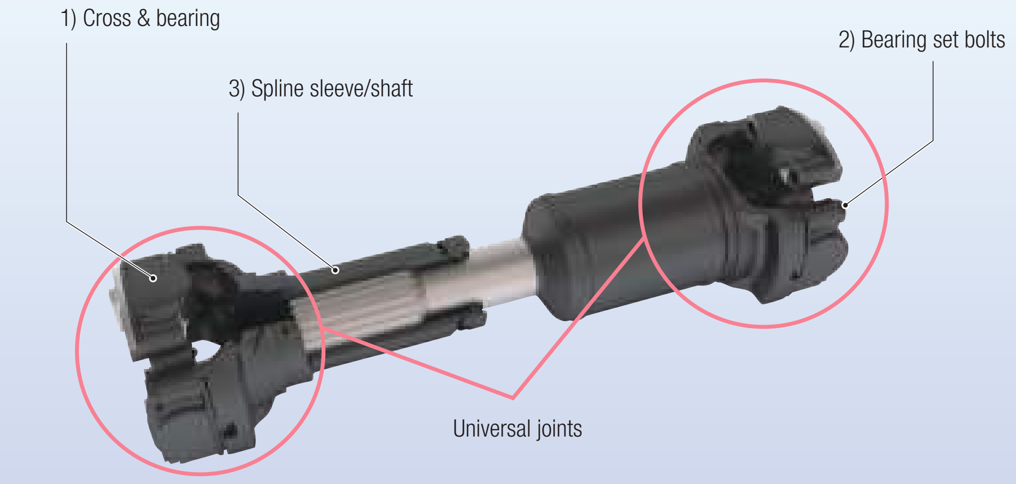


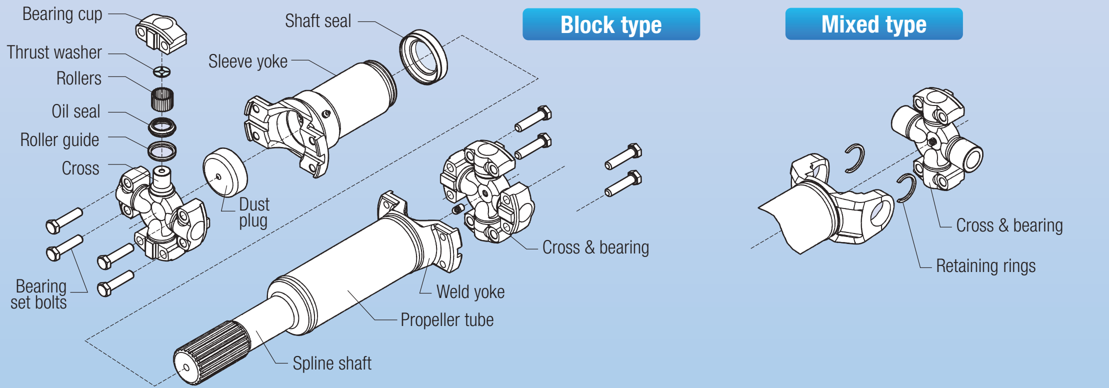
●For diesel locomotives



Appearance and configuration of drive shafts

【The appearance and component configuration of a representative drive shaft】





1) Cross & bearing

The cross & bearings are the most critical components of a drive shaft.
A cross & bearing has a cross-shaped shaft and four rolling bearings that individually support each end of the shaft.

2) Bearing set bolt

The bearing set bolt is used to connect the cross & bearing and its mating part (a retaining ring is used for mixed type).

3) Spline sleeve/shaft

The spline sleeve has a spline bore and shaft, which realize a variable drive shaft installing length.

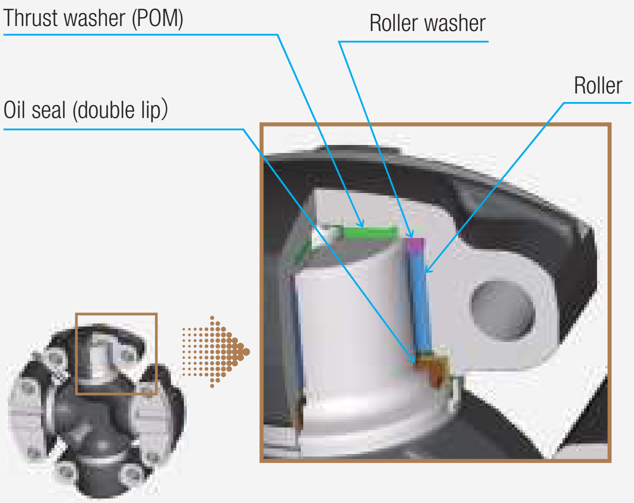
Efforts to improve reliability

1. Long-interval greasing cross & bearing

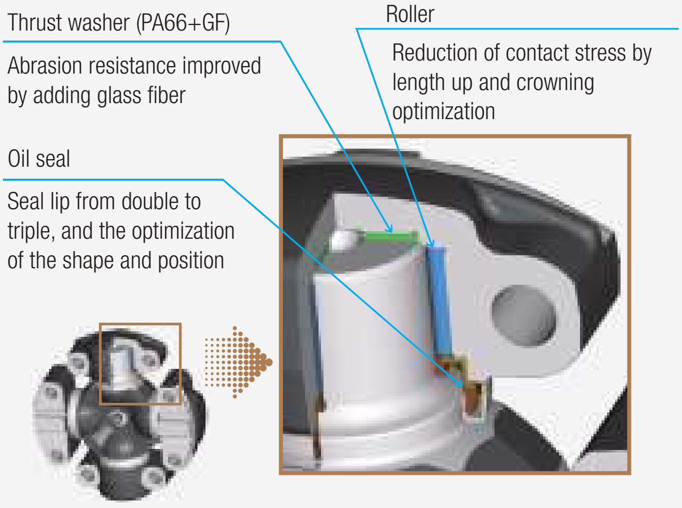
Features

(1) Oil seal lip from double to triple, and the optimization of shape and position.
(2) Reduction of roller contact stress with torque load by length up and crowning optimization
(3) Abrasion resistance improved by adding glass fiber to thrust washer
(4) Bearing cup shape reviewed and cost reduced by abolishing the roller washer

Cross & bearing structure



Conventional product: Greasing interval of 250 hours

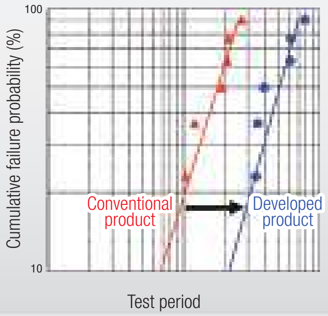


Product with long-interval greasing:
Greasing interval of 2000 - 4000 hours

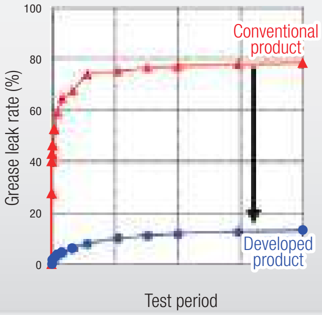
Evaluation results

Greasing interval extended 10 times or more

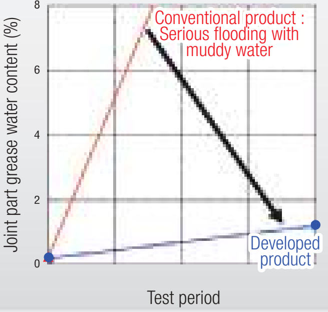
■ Cross & bearing life test result



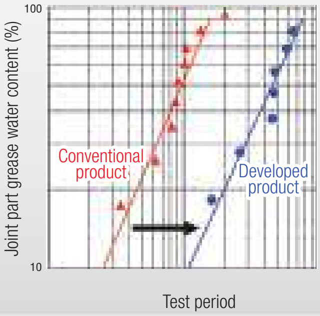
■ Grease leakage test result



■ Cross & bearing muddy water resistance test result



■ Dust resistance test result



2. Spline seal structure of muddy water resistance improvement

Features

Since the cover tube type spline seal has a structure that seals the sleeve (female spline) outer diameter part,

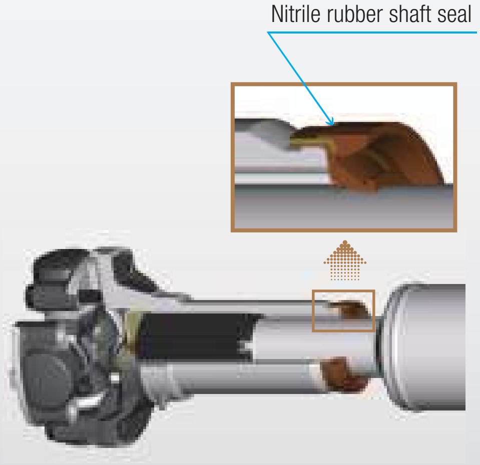
(1) It is not necessary to surpass the male spline major diameter by deforming the seal lip at the time of assembly, so a urethane rubber seal with high rigidity can be used.

(2) The distance from the seal to the spline is long, so muddy water does not reach the spline easily.

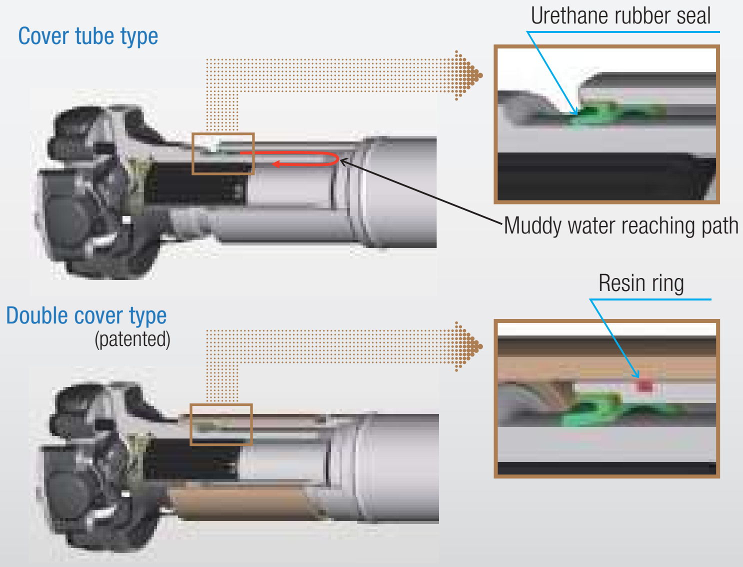
(3) A double cover has been added to protect the seal part, improving endurance further.

Spline seal configuration

【Standard product】

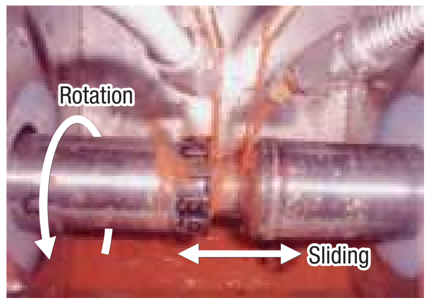


【Countermeasure product】

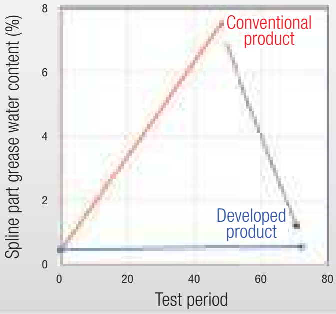


Evaluation result of spline muddy water endurance test

Muddy water resistant performance **greatly** improved



■ Spline muddy water endurance test result

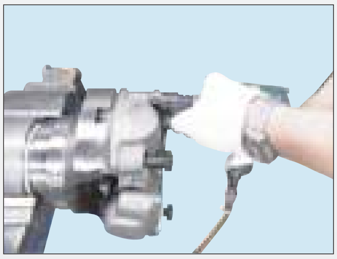


Handling explanation

High wing series features safe and secure torque transmission by a parallel key, and high torque capacity.
The following are the handling method and caution points to ensure that the drive shaft delivers its expected performance.

Handling of drive shaft

Caution points for handling



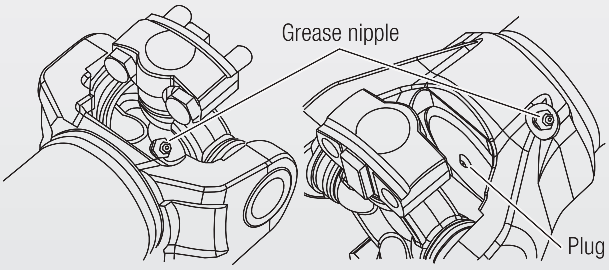
(1) Do not hit the cross & bearing part with hard metal so that a shock should be avoided. If it is necessary at the time of assembling, hit it lightly with a non-ferrous metal (copper, etc.) or plastic hammer.

(2) Tighten the fixing bolts of the bearing cups by setting the bearing cups in the proper positions in the yoke to form an X shape.
If you fit the bearing cups with the tightening force of bolts or fix only one bearing cup with the bolt and then set the other, it may cause troubles such as scars on the spigot joint part and attaching surface, and attachment of bearing cups at a slant.

(3) Never conduct welding between the bolts and the bearing cups and between the yoke and the bearing cups.

(4) Do not disassemble the cross & bearings unless absolutely necessary.

About lubrication



(1) Greasing interval
It is recommended to apply grease every 2000 - 4000 hours, though it depends on the usage environment.
(2) Grease to be used
Lithium grease with extreme-pressure additive
(3) Greasing of cross & bearings
Apply grease until it overflows from all of the four shafts of the cross. Wipe off the overflowing grease because dirt may adhere to it.

(4) Greasing of spline part
To apply grease an onboard drive shaft, move the vehicle body so that the spline should be compressed to the minimum. When grease leaks out of the center of the plug attached to the sleeve yoke, greasing is complete.
If the drive shaft is removed from the vehicle because of overhaul, etc., apply grease with the spline compressed to the minimum.

About cross & bearing attaching bolt

(1) Bolt
Use the attached bolt or part for repair specified by JTEKT.
(2) Torque wrench
Use a calibrated torque wrench.
(3) Specified tightening torque
Tighten with the specified torque.

Cases of failures

Flaking

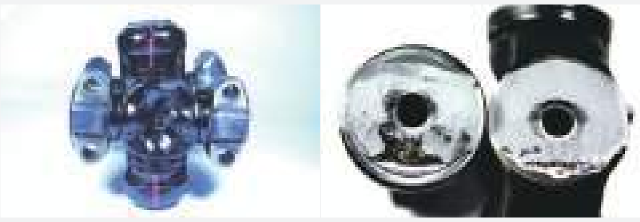
Failures example Flaking has occurred in the raceway surface of rolling contact surface of the cross and cup.

Measure Compare the calculated life and the required life and increase the size as necessary

Breakage

Failures example Breakage is caused from the fillet radius part of the neck of the cross and the fracture surface has no beach mark

Cause Brittle fracture due to excessive load



Measures Check the usage conditions
Increase the size as necessary

Failures example Breakage is caused from the fillet radius part of the neck of the cross, and the fracture surface has a beach mark

Cause Fatigue fracture caused by excessive load applied repeatedly

Measures Check the usage conditions
Increase the size as necessary

Failures example The tube has a crack near the border of the tube and weld bead

Cause Fatigue fracture caused by excessive load applied repeatedly

Measures Check the usage conditions
Increase the size as necessary

Failures example The bearing set bolts are broken near the yoke interface

Cause Bolt fatigue fracture caused by looseness of the bolts

Measure Check that the tightening torque has the specified value

Failures example Bending near the center of the drive shaft

Cause Brittle fracture caused by use around the dangerous rotational speed

Measures Decrease the maximum rotational speed. If it is impossible, reduce the length or increase the tube size

General characteristics of universal joint

Single universal joints

The driving shaft and driven shaft intermediated by a universal joint has the following relationship between their rotational angles:

$$\tan\phi_2 = \cos\theta \cdot \tan\phi_1 \quad \cdots(1)$$

where ϕ_1 : Rotational angle of driving shaft
ϕ_2 : Rotational angle of driven shaft
θ : Shaft operating angle (**Fig. 1**)

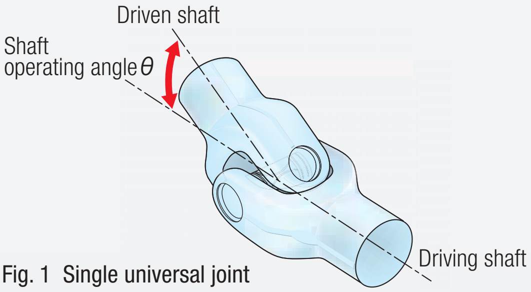


Fig. 1 Single universal joint

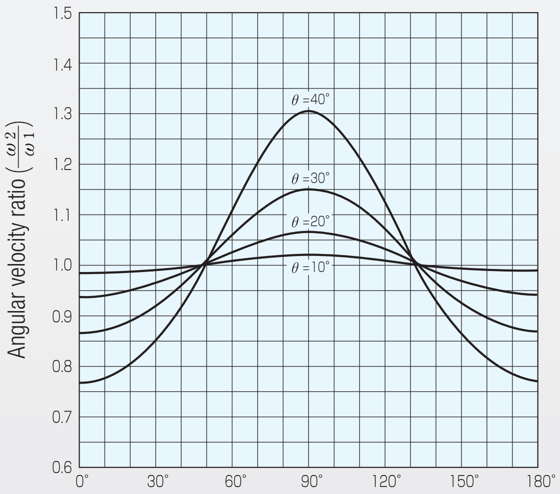
This means that, even if the rotational speed and torque of the driving shaft are constant, the driven shaft is subject to fluctuation in rotational speed and torque.
The speed ratio between the driving shaft and driven shaft can be obtained by differentiating equation (1) with respect to time (t), where ϕ_1 is by $\omega_1 \cdot t$ and ϕ_2 by $\omega_2 \cdot t$:

$$\frac{\omega_2}{\omega_1} = \frac{\cos\theta}{1-\sin^2\phi_1 \cdot \sin^2\theta} \quad \cdots(2)$$

where ω_1 : Rotational angular velocity of driving shaft (rad/s)
ω_2 : Rotational angular velocity of driven shaft (rad/s)
ω_2/ω_1 : Angular velocity ratio



Rotation angle of driving shaft ϕ_1
Fig. 2 Angular velocity fluctuation

Equation (2) can be expressed in diagram form as shown in **Fig. 2**. The maximum value and minimum value of the angular velocity ratio can be expressed as follows:

$$(\omega_2/\omega_1)\ \text{max.} = 1/\cos\theta \quad \cdots\cdots \quad \phi_1 = 90°$$
$$(\omega_2/\omega_1)\ \text{min.} = \cos\theta \quad \cdots\cdots \quad \phi_1 = 0°$$

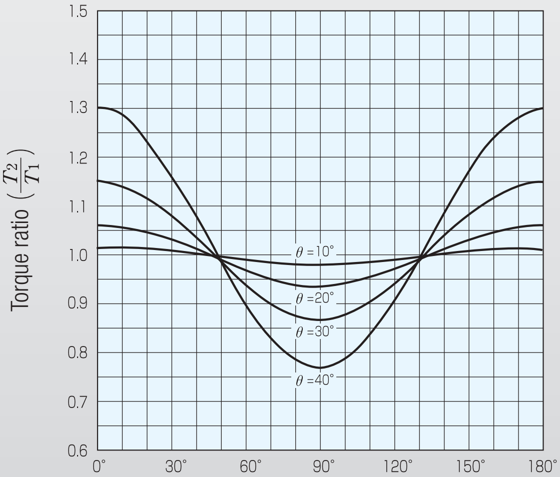
The maximum fluctuation rate of angular velocity in a universal joint can be expressed by the following equation:

$$\frac{(\omega_2\,\text{max.} - \omega_2\,\text{min.})}{\omega_1} = \frac{1}{\cos\theta} - \cos\theta$$

The torque ratio between input and output can be expressed by the diagram shown in **Fig. 3**. The maximum value and minimum value can be obtained as shown below, respectively:

$$(T_2/T_1)\ \text{max.} = 1/\cos\theta \quad \cdots\cdots \quad \phi_1 = 0°$$
$$(T_2/T_1)\ \text{min.} = \cos\theta \quad \cdots\cdots \quad \phi_1 = 90°$$

where T_1 : Input torque
T_2 : Output torque
T_2/T_1: Torque ratio



Rotation angle of driving shaft ϕ_1
Fig. 3 Torque fluctuation

Double universal joints

Universal joints are usually installed in pairs. When assembled as shown in **Fig. 4**, that is,

(1) With equal operating angles in both joints

(2) Yokes connected to the same shaft in line

(3) Central lines of all three shafts (driving shaft, intermediate shaft, and driven shaft) in the same plane, the driven shaft rotates exactly in the same way as the driving shaft.

Therefore, they should be attached as shown in the figure on the right as far as possible.

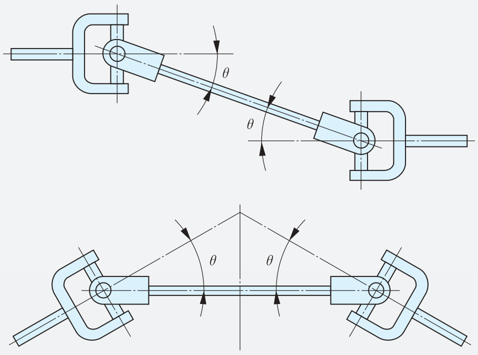


Fig. 4 Installation of double universal joints

Secondary couple

It is often necessary to consider the secondary couples imposed by universal joints operating at an angle; especially under high angle or large torque. These couples must be taken into account in designing the shafts and supporting bearings.

The secondary couples in the universal joints are in the planes of the yoke. These couples are about the intersection of the shaft axis. They impose a load on the bearings and a bending stress in the shaft connecting the joints, and they fluctuate from maximum to zero every 90° of shaft revolution. The broken lines in **Fig. 5** indicate the effect of these secondary couples on the shafts and bearings.

The equation for maximum secondary couple is as follows:

M_1 max. $= T \tan\theta$ (for driving shaft)

M_2 max. $= T \sin\theta$ (for driven shaft)

where M_1: Secondary couple on driving shaft $(\mathrm{N\cdot m})$

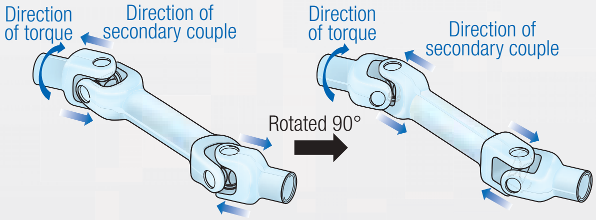
M_2: Secondary couple on driven shaft $(\mathrm{N\cdot m})$

T : Driving torque $(\mathrm{N\cdot m})$

θ : Shaft operating angle

The ratio of the secondary couple to the driving torque is shown in **Fig. 6**.

The secondary couple M_1 and M_2 can be obtained by multiplying M_1/T or M_2/T by the driving torque T.



(Maximum secondary couple is produced on the driving side yoke and the driven side yoke alternately at every rotation of 90°)

Fig. 5 Effect of secondary couple

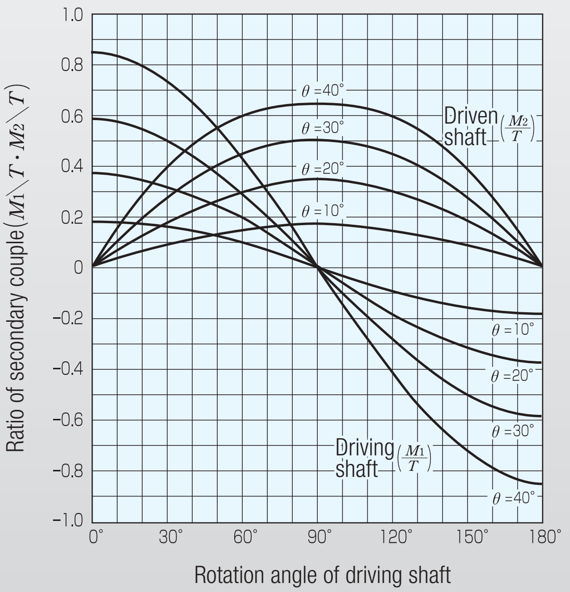


Fig. 6 Fluctuation of secondary couple to driving torque

Drive shaft selection

A drive shaft should be selected so as to satisfy the required strength, service life, operating angle and dimensions necessitated by its purpose. Especially, a drive shaft can be selected if it meets conditions of both strength and life of the universal joint, except for special cases.

Load torque of drive shaft

To decide the size of the drive shaft, it is necessary to grasp the load torque first.

A maximum torque including an impact torque and a mean torque should be known, and it is essential for selecting an appropriate drive shaft to understand the correct maximum torque and mean torque.

Maximum torque:
Value to determine if the strength of each part is sufficient.
Mean torque:
Value necessary to calculate the service life

Mean torque

It is apparent that all kinds of machines are not operating thoroughly by their maximum torque. Therefore, if a drive shaft is selected according to a service life calculated from the maximum torque, it results in being uneconomically larger than necessary.

So, it is reasonable to set up a longer expected service life, if the application condition are severe; and shorter, if the conditions are easy.

If, for instance, a job is expressed as in the table below,

Drive stage	1	2	3 · · · · · Z
Torque $(\mathrm{N \cdot m})$	T_1	T_2	$T_3 \cdot\cdot\cdot\cdot\cdot T_Z$
Rotational speed $(\mathrm{min^{-1}})$	n_1	n_2	$n_3 \cdot\cdot\cdot\cdot\cdot n_Z$
Time ratio $(\%)$	t_1	t_2	$t_3 \cdot\cdot\cdot\cdot\cdot t_Z$

the cube root of mean torque (T_m) and the arithmetical mean of rotational speed (n_m) are yielded from the following equations.

$$T_m = \sqrt[3]{\frac{(T_1^3 \cdot n_1 \cdot t_1 + \cdots\cdots\cdots T_Z^3 \cdot n_Z \cdot t_Z)}{(n_1 \cdot t_1 + \cdots\cdots\cdots + n_Z \cdot t_Z)}}$$

$$n_m = \frac{(n_1 \cdot t_1 + \cdots\cdots\cdots + n_Z \cdot t_Z)}{(t_1 + \cdots\cdots\cdots + t_Z)}$$

Strength of drive shaft

A drive shaft should be selected so that the normal maximum torque shall not exceed the “T_D torque." However, it is difficult to determine the true maximum torque, and the engine capacity or motor capacity is used as the maximum torque in many cases, so the safety factor (f_S) of no less than 1.0 should be considered as the most desirable.

$f_S = T_D$ /maximum torque under normal operating conditions > 1.0

The maximum torque that may occur in an emergency should be determined using "T_S torque." The safety factor (f_S) of no less than 1.5 should be considered as desirable in this case as well.

$f_S = T_S$ /breaking torque under emergency conditions > 1.5

To select a drive shaft based on a safety factor of 1.5 or less, consult JTEKT as close examination is required in consideration of previous performance records.

Life of drive shaft

There is no worldwide standard for service life calculation of universal joint bearings (cross & bearings) and the service life is calculated according to the unique method developed by each manufacturer.

JTEKT employs the following empirical equation based on extensive experimentation (conforming to SAE).

The service life L_h is defined as the expected number of operating hours before a flaking occurs on the rolling contact surface of the bearing. The use of the bearings over the service life L_h may be practical on a low speed machine.

$$L_h = 3000\ K_e \left(\frac{T_R \cdot K_n \cdot K_\theta}{T_m} \right)^{2.907}$$

Where, L_h: Average calculated bearing life (h)
K_e : Experimental correction coefficient (=2)
T_R: Rated torque $(\mathrm{N \cdot m})$
T_m: Mean torque $(\mathrm{N \cdot m})$
K_n: Speed factor = $10.2/n^{0.336}$
K_θ: Angle factor = $1.46/\theta^{0.344}$
n : Rotational speed = $(\mathrm{min^{-1}})$
θ : Shaft operating angle (°)

Note) A drive shaft should be selected by considering the type of the machine, peripheral equipment, particular operating conditions, and other factors. The method outlined in this catalog is a common rough guide. It is recommended to consult JTEKT for details.

Balance quality of drive shaft

If a rotating drive shaft is unbalanced, it may adversely influence the equipment and ambient conditions, thus posing a problem. JTEKT designs and manufactures drive shafts to satisfy the balance quality requirements specified in JIS B 0905.

Expression of balance quality

The balance quality is expressed by the following equation:

Balance quality $= e\omega$

or

Balance quality $= en/9.55$

where e: Amount of specific unbalance (mm)

This amount is the quotient of the static unbalance of a rigid rotor by the rotor mass. The amount is equal to the deviation of the center of the rotor mass from the center line of the shaft.

ω : Maximum service angular velocity of the rotor (rad/s)

n : Rotational speed (min^{-1})

Balance quality grades

The JIS specifies the balance quality grades from G0.4 to G4000. Generally, the three grades described in Table 1 below are commonly used.

Correction of the unbalance of drive shafts

JTEKT corrects the unbalance of drive shafts to the optimal value by the two plane balancing method, using the latest balance system.
To correct the balance of a drive shaft, it is critical to correct the balance between two planes each near the two individual universal joints, instead of by the one plane balancing as used to balance car wheels.
Especially in the case of a long drive shaft, this two plane balancing method is the only way to acquire good results.

Table 1 Recommended balance quality grades (excerpt from JIS B 0905)

Balance quality grade	Upper limit value of balance quality ($e\omega$)	Recommended applicable machines
G40	40	Car wheels, wheel rims, wheel sets and drive shafts Crankshaft systems of elastically mounted high speed four stroke engines (gasoline or diesel) with six or more cylinders Crankshaft systems of the engines of automobiles, trucks and rolling stock
G16	16	Drive shafts with special requirements (propeller shafts and diesel shafts) Components of crushing machines Components of agricultural machines Components of the engines of automobiles, trucks and rolling stock (gasoline or diesel) Crankshaft systems with six or more cylinders with special requirements
G 6.3	6.3	Devices of processing plants Ship engine turbine gears (for merchant ships) Centrifugal drums Papermaking rolls and printing rolls Fans Assembled aerial gas turbine rollers Flywheels Pump impellers Components of machine tools and general industrial machines Medium or large electric armatures (of electric motors having at least 80 mm in the shaft center height) without special requirements Small electric armatures used in vibration insensitive applications and/or provided with vibration insulation (mainly mass produced models) Components of engines with special requirements

Composition of identification numbers

Drive shaft

2 A 70 Z 000 065 1 ☐

Identification code: Given in alphabetic order if design is changed
Configuration code: Refer to pages 15 - 27.
Length code: The distance between centers of the cross & bearings is rounded off to cm (Example) 652 mm→ 065, 657 mm→ 066
Serial number: Given by JTEKT
Z is given to the mixed types of #5 and #6, and no code is given for others
Size code: Represented in two digits

Model No.	Size code
#4 - #9	Size x 10
#10, #12	The size is used as it is

Type code

Type code	Type
A	Block (smaller than #10)
Z	Block (#10 or larger)
M	Mixed

Quantity of cross & bearings

Drive shaft service parts

*Confirm with JTEKT about correspondence to each drive shaft.

(1) Cross & bearing

BA M 070 0 5 1 B W

Thrust washer code: Given if a washer is used
Grease nipple code: Given by JTEKT according to the type of grease nipple
Bearing cup mounting hole shape: Given by JTEKT
Cross female screw code: Given by JTEKT
Identification code: Given in alphanumeric characters
Size code: Represented in three digits Size x 10
Bolt code

M	For metric screw thread
U	For unified screw thread

Type code

Type code	Type
BA	Block
BM	Mixed

(2) Sleeve shaft assembly

SPA 070 000 ☐

Identification code: Given in alphabetical order if design is changed
Serial number: The number same as that of the parent drive shaft is given
Size code: Represented in three digits Size x 10

Type code

Type code	Type
SPA	Block
SPR	Mixed

(3) Bearing fixing bolt

MM 12 X 53 X 1.25 ☐

Identification code: Given in alphabetical order if design is changed
Pitch
Shank length
Nominal diameter
Screw type

MM	For metric screw thread
NF	For unified screw thread

The model numbers of standard bolts are as follows.

Size	Screw type	Nominal No.
#4	Metric screw thread	MM8 X 38 X 1.25
	Unified screw thread	NF5/16 X 38 X 24
#5, #6	Metric screw thread	MM10 X 45 X 1.25Z
	Unified screw thread	NF3/8 X 044 X 24
#7, #8	Metric screw thread	MM12 X 53 X 1.25
	Unified screw thread	NF1/2 X 51 X 20
#8.5, #9	Metric screw thread	MM12 X 60 X 1.25
	Unified screw thread	NF1/2 X 60 X 20
#10, #12	Metric screw thread	MM14 X 080 X 1.5
	Unified screw thread	—

Product Information for Agricultural and Construction Equipment

JTEKT

JTEKT CORPORATION

For superior strength and durability in all environments

Heavy machinery in the agriculture and construction supports economic growth and infrastructure, and is indispensable in daily life. JTEKT's highly functional products contribute to ensuring long service life in severe conditions and improving reliability.

JTEKT products supporting heavy machinery in agriculture and construction

Under such severe conditions, JTEKT responds with No.1 & Only One technologies.

Responding to Needs with
No.1 & Only One Technologies

With a manufacturing history of more than 90 years,
JTEKT clearly understands the needs of its customers,
promptly delivers the reliability and product competitiveness required,
and backs it up with a global support system.

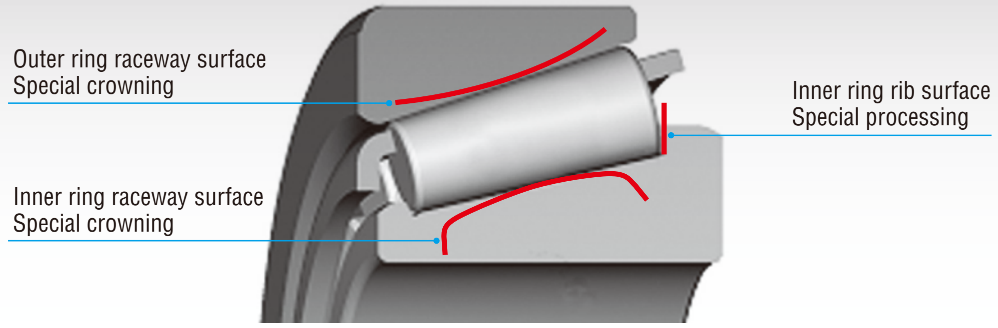
Needs to Agriculture/Construction Heavy Machinery	Bearing Feature	
Improved Durability	Improved load performance Better misalignment endurance	1
	Improved life in contaminated oil	2
	Improved lubricating technologies	3
Global Environmental Preservation	Low friction torque	4
	Lightweight	5
	Extending maintenance cycle Reusable	6

JTEKT Technology Responding to Needs		
Optimum design technologies	1 4 3	・Inner specification optimization ・Crowning optimization ・Low temperature rise design
Material/heat treatment technologies	1 5 2 6	・KE heat treatment: case-hardened steel ・SH heat treatment: bearing steel
Analysis technologies	1 3 2	・Shaft System Analysis Program (SSAP) ・CAE analysis (static analysis/dynamic analysis) ・Benchmark evaluation tests ・X-ray/ultrasound analysis
Surface reforming technologies	3 6	・Special coating process ・Surface roughness optimization

JTEKT products responding to agricultural / construction machinery needs ❶

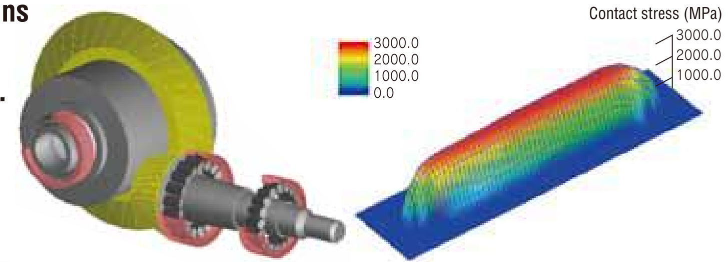
Optimum design technologies

High performance tapered roller bearing

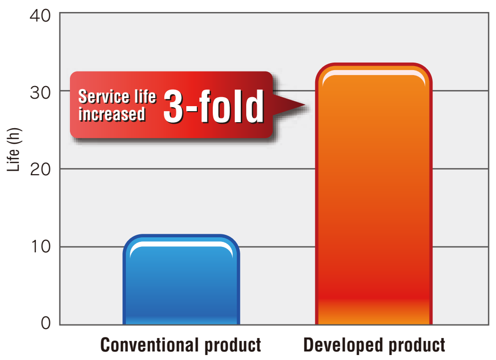


Improved durability (edge stress mitigated by misalignment shaft and low temperature rise)

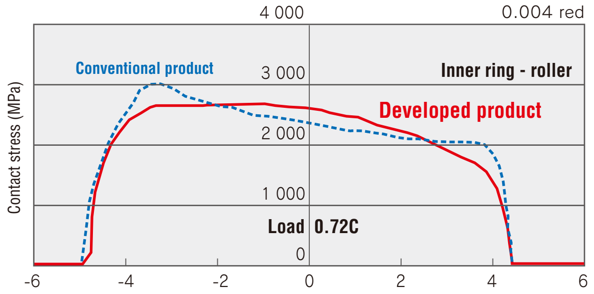
- **Due to optimization of inner specifications and special crowning of bearing ring, bearing force improved by misalignment.**



■ Misalignment durability life evaluation results

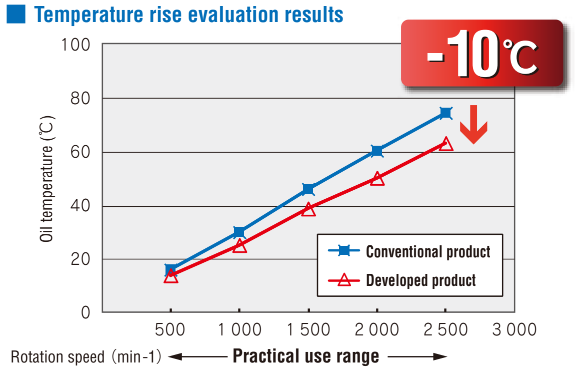


■ Contact stress calculation results



- **Due to special processing of inner ring rib and special crowning of bearing ring, low temperature rise is achieved. Bearing endurance also improved by oil film formation**

■ Temperature rise evaluation results



Material/heat treatment technologies

KE heat treatment

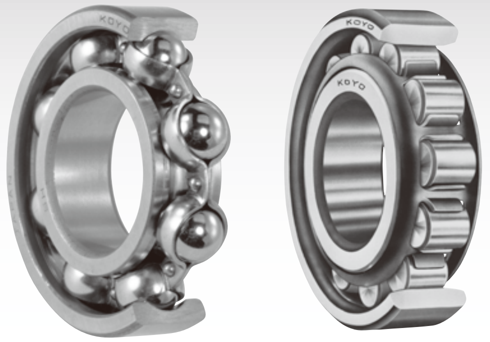
(KE:Koyo Extra-life Bearing)

- **Apply to case-hardened steel**

SH heat treatment

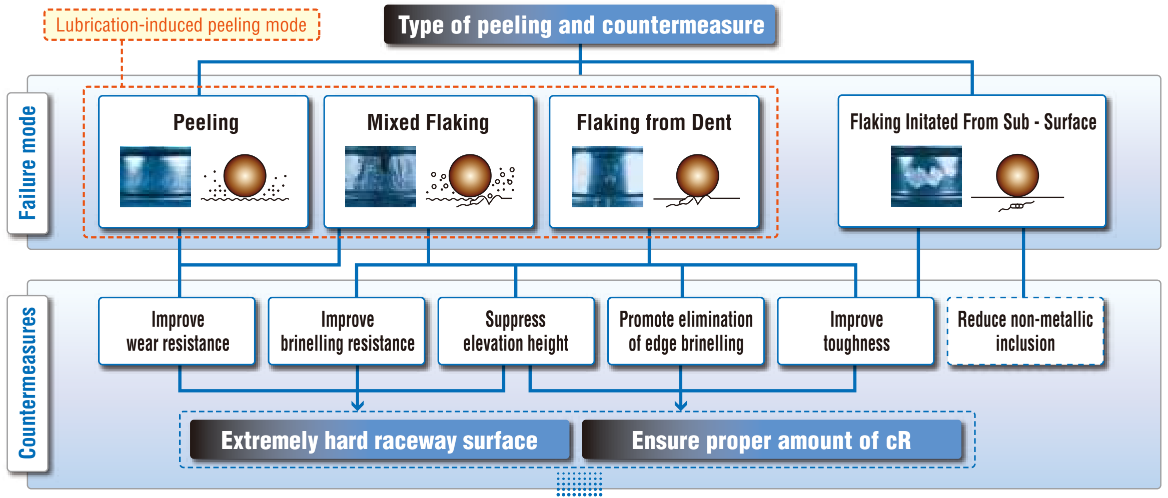
(SH:Special Heat Bearing)

- **Apply to bearing steel**



KE heat treatment/SH heat treatment

- **Special heat treatment realizes extremely hard raceway surface and optimization of residual austenite achieves long life. Especially, superior performance in contaminated oil.**



Lubrication-induced peeling mode

Type of peeling and countermeasure

Failure mode

- Peeling
- Mixed Flaking
- Flaking from Dent
- Flaking Initated From Sub - Surface

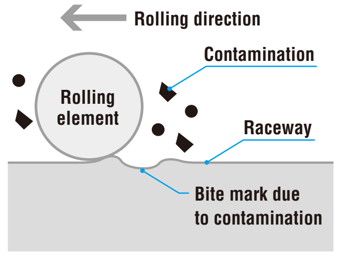
Countermeasures

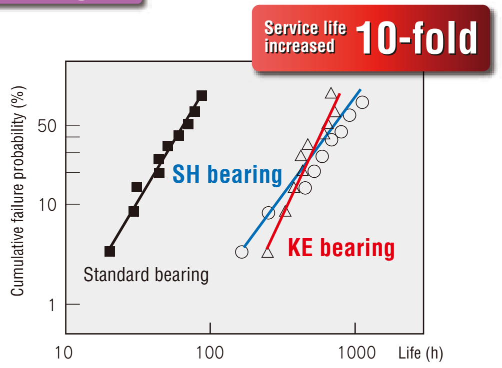
- Improve wear resistance
- Improve brinelling resistance
- Suppress elevation height
- Promote elimination of edge brinelling
- Improve toughness
- Reduce non-metallic inclusion

Extremely hard raceway surface

Ensure proper amount of cR

KE bearing / SH bearing





KE:Koyo Extra-life Bearing SH:Special Heat Bearing

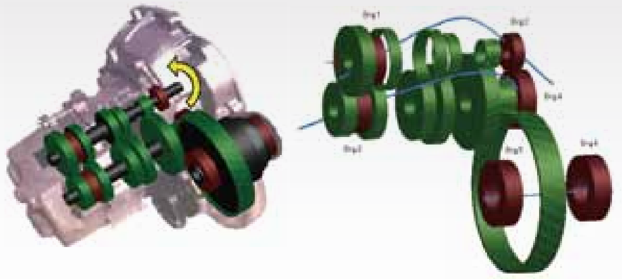
JTEKT products responding to agricultural/ construction machinery needs ❷

Analysis technologies

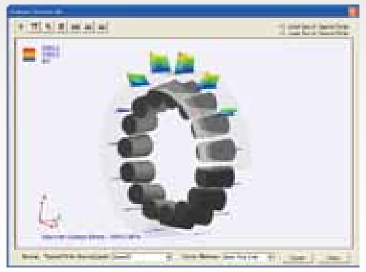
Verify validity of optimum design

- Fully utilizing the Shaft System Analysis Program (SSAP) developed by JTEKT and CAE analysis, an optimum design that gives peripheral components additional rigidity has been achieved. Validity is verified through benchmark evaluation tests (including simulation), and X-ray and ultrasound analysis.

【Shaft system rigidity analysis】

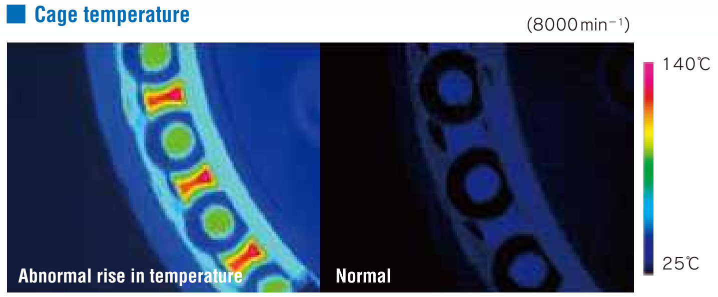


【Contact stress analysis】



【Inner temperature measurement results】

■ Cage temperature



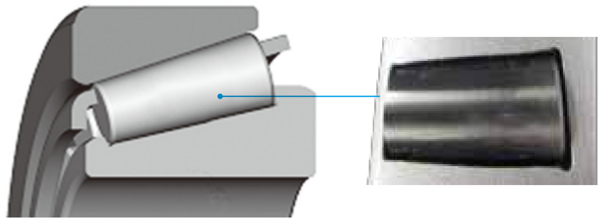
Large-sized Bearing Technology Development Center

- JTEKT has established and started operation of the Large-size Bearing Technology Development Center, where large-sized bearings used in industrial machinery are evaluated and analyzed. Until now, large bearings were manually inspected and then put into the actual machinery for basic evaluations. However, the newly established development center enables more detailed evaluation by reproducing environments close to those of actual use inside the company.

Surface reforming technology

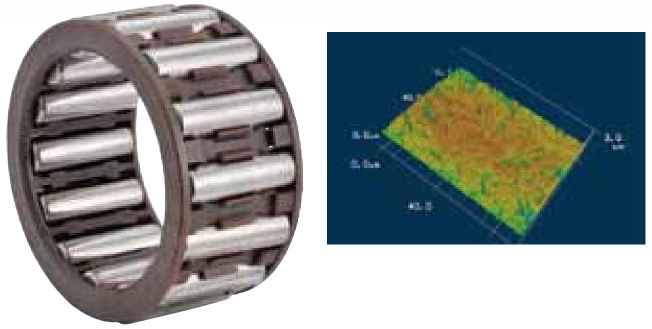
Special coating process

- Durability 3-fold that of non-coated product



Cage and roller (C&R) in response to poor lubrication

- Roller surface roughness optimized for improved oil film retention



JHS Series Spherical Roller Bearings

（JHS : JTEKT Hyper Strong）

JHS Series Spherical Roller Bearings are satisfy the demanding needs of our customers. Manufactured using innovative materials, an optimal internal design and a standardized dimension stabilizing treatment, these bearings have a longer service life, faster rotation speed, enhanced axial load performance and can be used in high-temperature applications.

Innovative materials/Optimal internal design/High-temperature applications supported

Outer ring

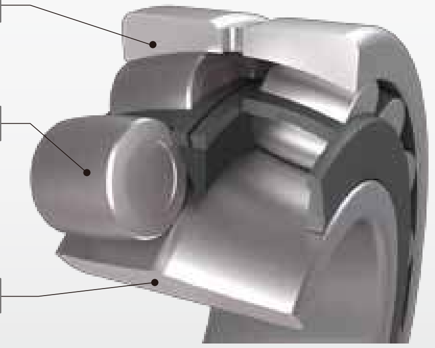
・JTEKT specification steel

Roller

・Roller maximized
・Number of rollers increased
・Roller position stabilized

Inner ring

・JTEKT specification steel



Bearing composition diagram

Longer service life
Max. 4-fold
compared to our existing products

Axial load performance
Max. 20%UP
compared to our existing products

Speed increased
Permissible rotation speed
Max. 25%UP
compared to our existing products

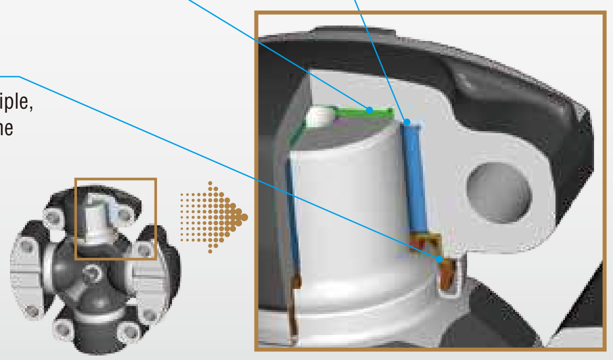
High-temp use
up to 200°C

Propeller shaft for construction machinery

Maintenance hours reduced by
improving cross bearing life and seal performance.

Long-interval greasing cross bearing

Greasing interval increased 10-fold



Thrust washer (PA66+GF)

Abrasion resistance improved by adding glass fiber

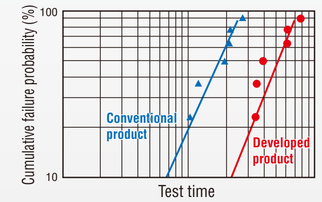
Oil seal

Seal lip from double to triple, and the optimization of the shape and position

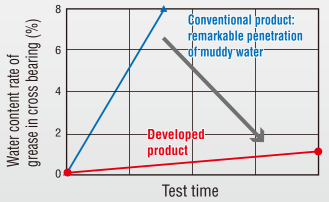
Roller

Reduction of contact stress by length up and crowning optimization

■ Cross bearing life test results

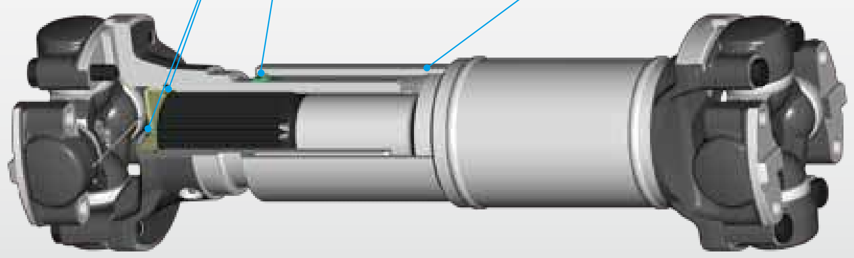


■ Cross bearing muddy water resistance test results



Spline seal structure of muddy water resistance improvement

Muddy water resistance improved 5-fold



Vent (dedicated to exhaust)/O ring

Prevent suction of muddy water when spline sliding

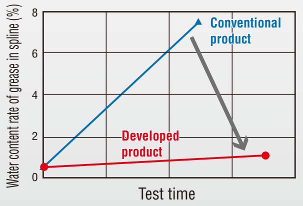
Oil seal

Rigidity of seal lip increased by changing material, from NBR to polyurethane rubber

Cover tube

Function of labyrinth achieved by extending the distance between seal and spline

■ Spline muddy water resistance test results



Oil seal

Seal technologies responding customers' needs for a variety of applications.

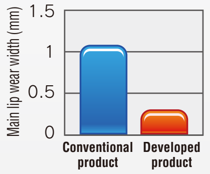
Muddy water resistance technology

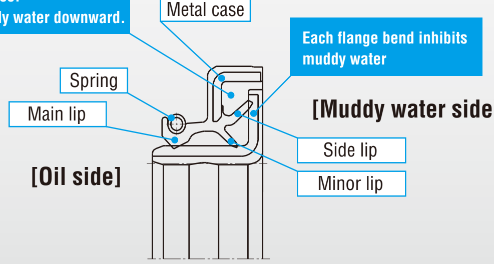
Lip wear width reduced 60%

Features

Side lip added to axle oil seal, creating multi-structured lip that prevents muddy water inclusion/oil leakage when traveling.

■ Muddy water resistance performance results using actual car





Tub formed using side lip and metal case. Directs muddy water downward.

Metal case

Each flange bend inhibits muddy water

Spring

Main lip

[Muddy water side]

[Oil side]

Side lip

Minor lip

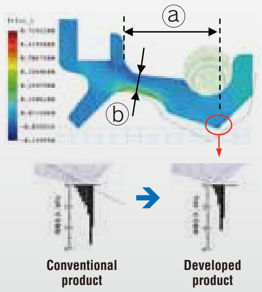
Low-torque technology

Rotating torque reduced 30%

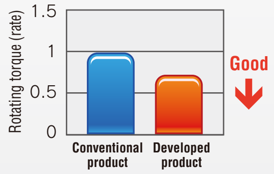
Features

Low-torque oil seal for engine/transmission contributes to reducing fuel consumption

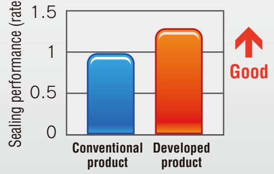
Lip length ⓐ and hip thickness ⓑ optimized, lowering strain force and abrasiveness



Reduced 30%



Lowering torque reduced abrasive effect 1.3-fold



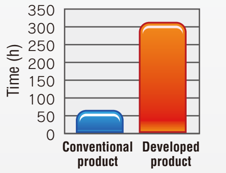
Sealing performance improvement technology

Service life increased 5-fold

Features

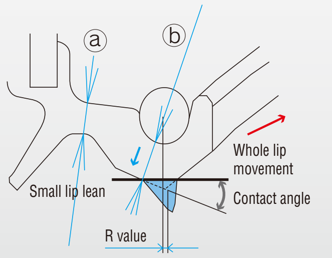
Stable sealing performance maintained by optimizing design optimized and changing the rubber material that inhibits lip torsion caused by sudden servo motor acceleration/deceleration.

Service life increased



Design optimization

Composition ratio (b/a): Large
Contact angle, R value: Standard



Low temperature technology

Low temperature performance improved 2-fold

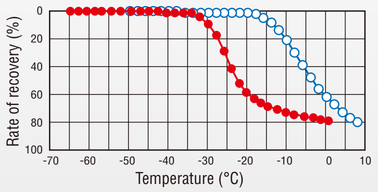
Features

Sealing performance of hydraulic pump and other parts improved by enhancing low-temperature daynamic run out followability.

Low-temperature environment

-15℃
↓
-30℃

■ 10% recovery temperature at time of 50% extension rate



■ Rubber material abrasion characteristics Lip sliding part after abrasion (dry) test

Conventional product	Developed product

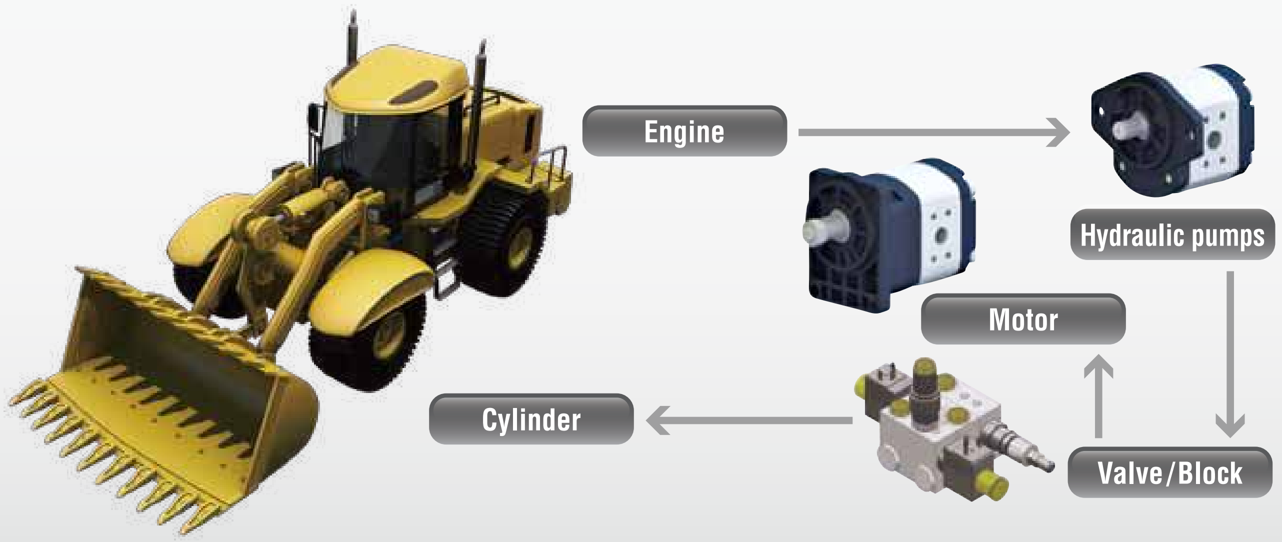
Hydraulic Components

With a standard lineup by highly efficient external gear pump technologies,
JTEKT hydraulic systems are built to respond to customer's requirements and specific needs.



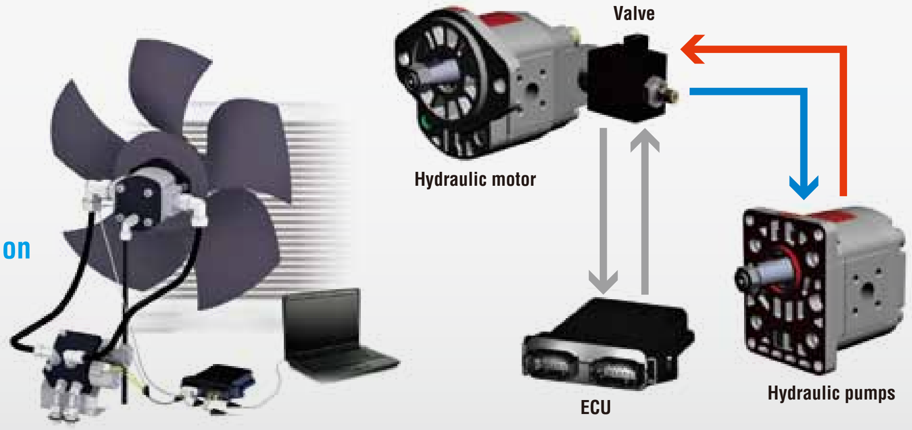
Cooling fan system with hydraulic motor control (HMC)

(HMC system)

Hydraulic control of fan speed ensures optimized cooling conditions for the engine and radiator.

Features

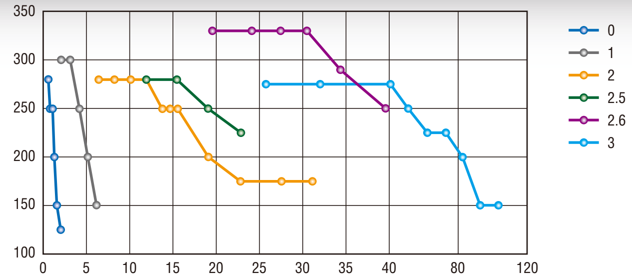
- Fuel consumption reduced
- Low noise
- On-demand cooling possible by setting various parameters
- Downsizing and Weight reduction
- Fan-stop and Reverse function



Hydraulic (external gear) pump/motor lineup

	Model	Basic Displacement	Max. Pressure	
Hydraulic (external gear) pumps	6 series 43 models	0.25-100cc/rew	33Mp	 Series 0 Series 1 Series 2 & 2,5 Series 2,6 Series 3
Hydraulic (external gear) motors	4 series 29 models	0.25-100cc/rew	25Mp	 Series 0 Series 1 Series 2 & 2,5 Series 3

With a basic displacement of 0.25-100cc/rev and maximum operating pressure of up to 33MPa, wide-range products can be provided to customer's needs.



Electric pump set/power pack lineup

	Model	Flow Rate	Output Power	
Electric pump set (Micro/Mini)	DC Type	0.4-25 L/min	400-4000 W		AC Type	1-25 L/min	550-4000 W	
Power pack (Micro/Mini)	DC Type	0.4-25 L/min	400-4000 W	
	AC Type	0.4-25 L/min	550-4000 W	
Valve/Block lineup

Valve	Pilot poppet Solenoide valves		Spool solenoide valves	
Block	**BAF** Assocative Function Blocks for in-Line mounfing		**MBS** Modular Block System	
Global Technical Support (Bearing Development Bases)

Roll neck bearings for rolling mill

JTEKT

JTEKT CORPORATION

JTEKT

Koyo TOYODA

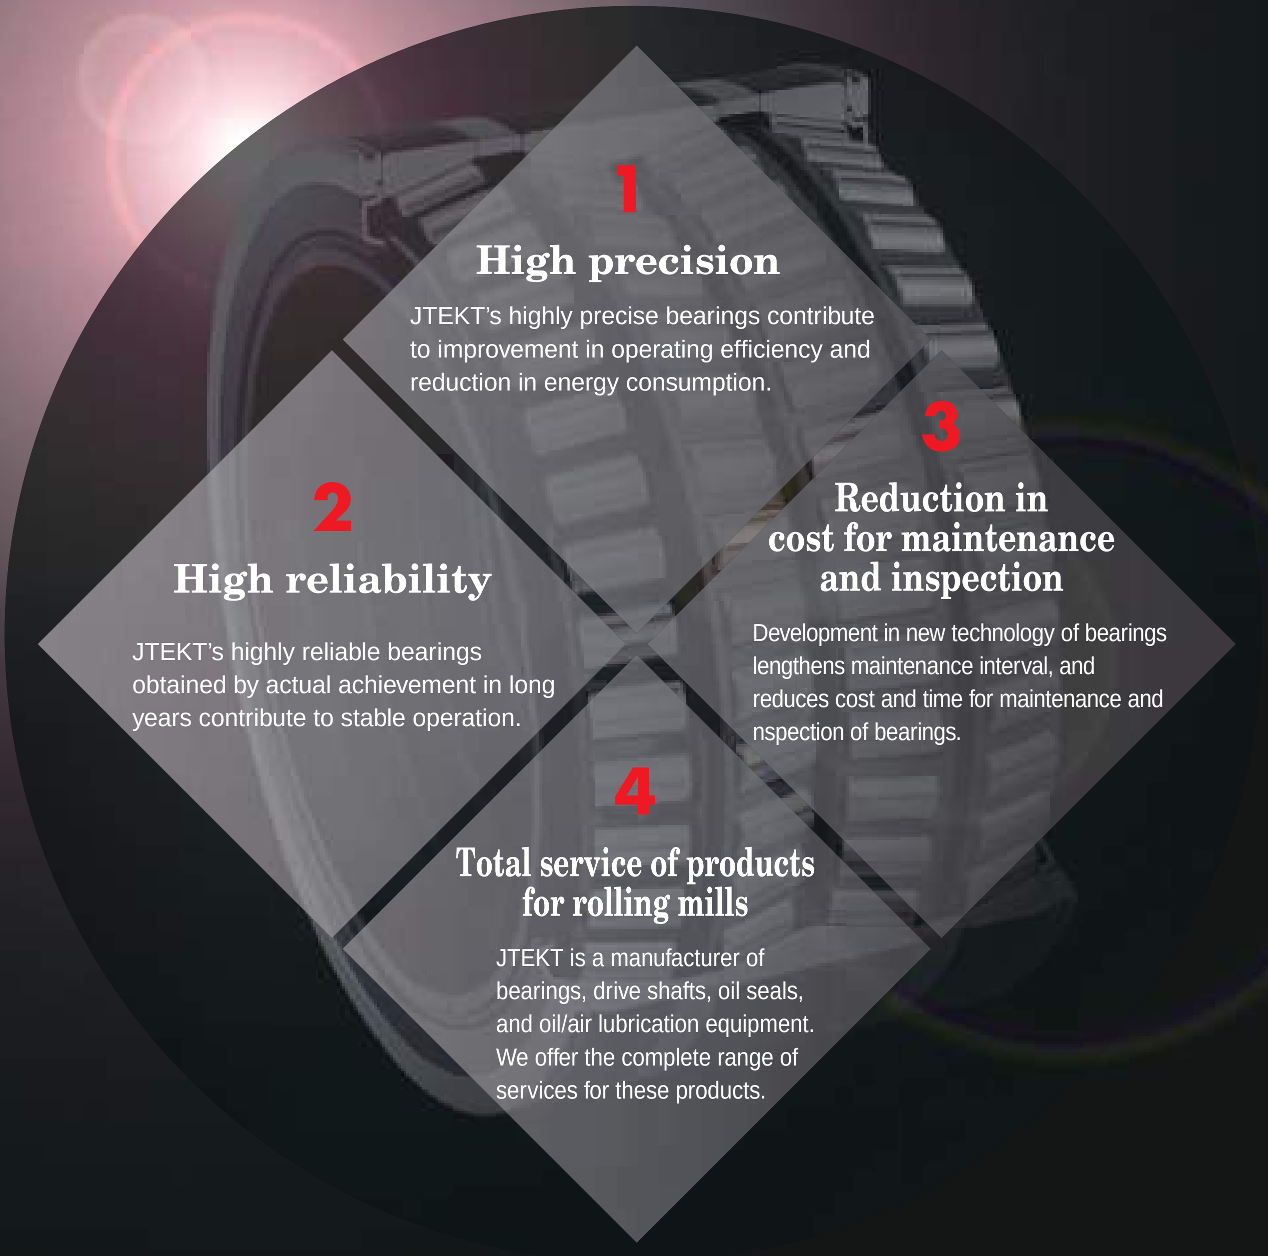
CAT. NO. B2013E-1

Preface

In 1943, JTEKT became the first successful domestic manufacturer of four-row tapered roller bearings for rolling mills in Japan. Since then, we have cultivated advanced technology and technical know-how to serve our customers. To meet with customers' requests, JTEKT strives for development of more highly precise and reliable bearings for rolling mills while using experience and actual achievement for technical development and research.

JTEKT will do a service by customer-oriented “monozukuri” (Japanese way of manufacturing) in the future.

Features of JTEKT products



1

High precision

JTEKT's highly precise bearings contribute to improvement in operating efficiency and reduction in energy consumption.

2

High reliability

JTEKT's highly reliable bearings obtained by actual achievement in long years contribute to stable operation.

3

Reduction in cost for maintenance and inspection

Development in new technology of bearings lengthens maintenance interval, and reduces cost and time for maintenance and nspection of bearings.

4

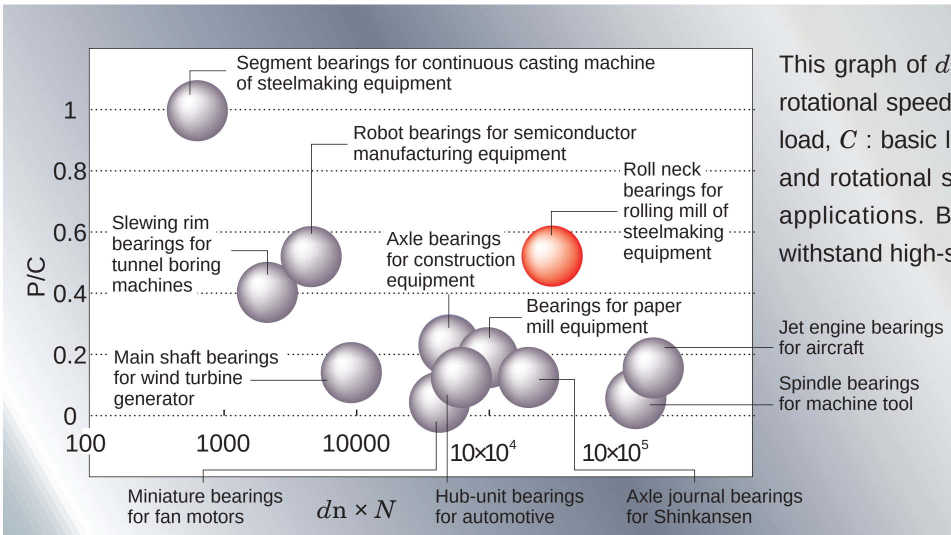
Total service of products for rolling mills

JTEKT is a manufacturer of bearings, drive shafts, oil seals, and oil/air lubrication equipment. We offer the complete range of services for these products.

Operating environment of bearings for rolling mill

Bearings in every industry are used under various kinds of severe conditions. For instance, bearings used in automobiles, railway stocks, and aircrafts are required to have ultimate reliability, as due to safety reasons, they are never allowed to fail during operation. While bearings used in machine tool spindles are required to have ultra-high rotational speed performance and high running accuracy. Bearings for rolling mills must withstand heavy loads and high-speed rotations as well as very severe operating environments. In various industries, they are used under severe conditions in every respects.

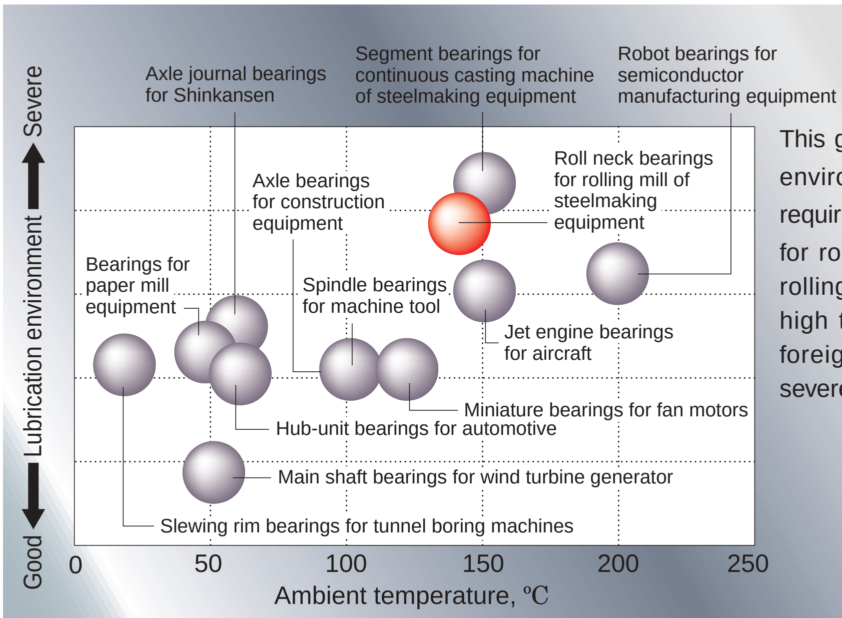
Load and rotational speed of bearings



Bearing load ratings and rotational speeds

This graph of $dn \times N$ (dn : bearing bore dia., N : rotational speed) and P/C (P : dynamic equivalent load, C : basic load rating) shows the bearing load and rotational speed required for various bearing applications. Bearings for rolling mills need to withstand high-speed rotation and heavy load.

Operating environment



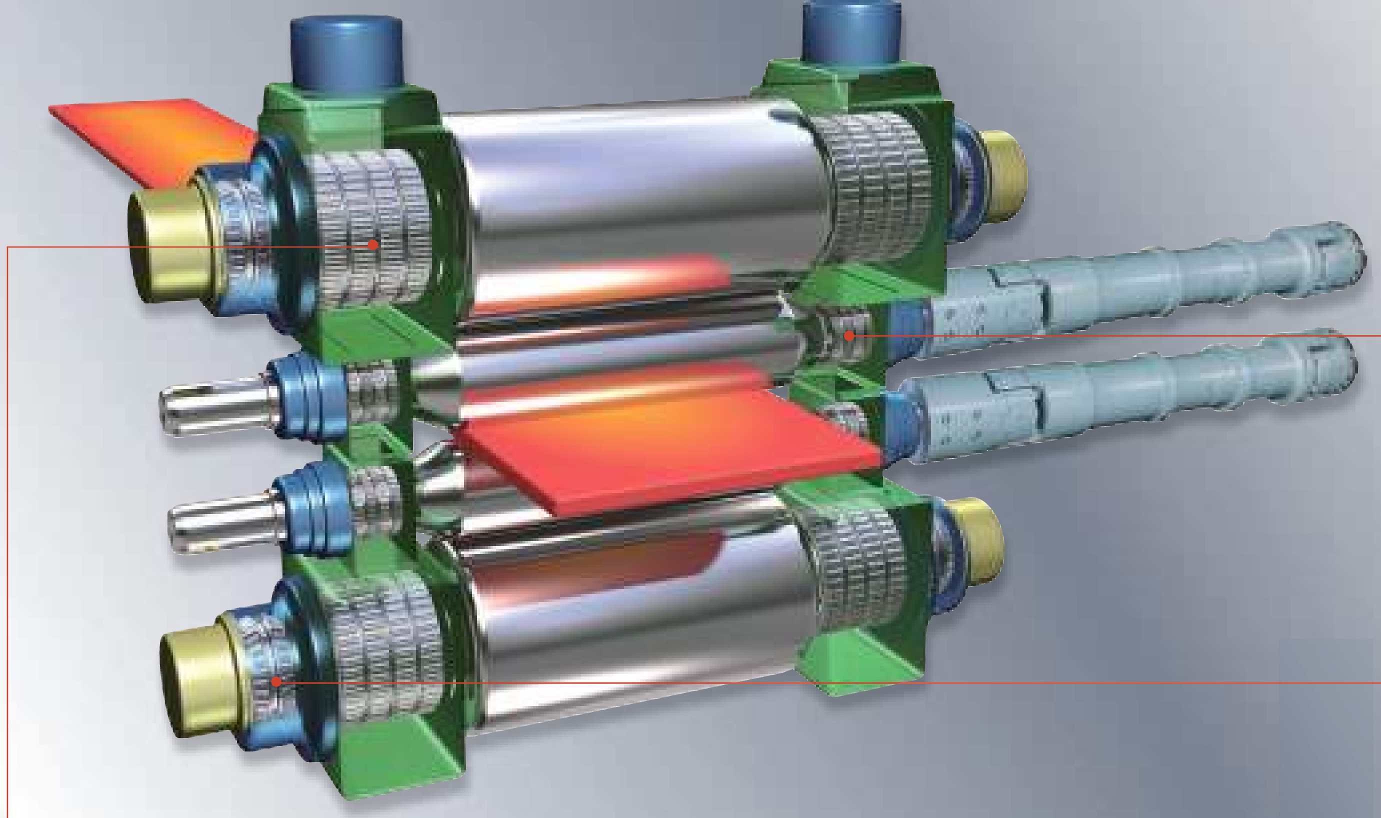
Bearing ambient temperature and lubrication conditions

This graph of ambient temperature and lubrication environment shows the operating environments required for various bearing applications. Bearings for rolling mills, especially in the process of hot rolling, are often used under severe conditions, high temperature and possibility of intrusion of foreign matters. Thus, they must endure these severe conditions.

Roll neck bearings for rolling mill

* For information on bearings not listed here, consult with JTEKT.

Hot / cold strip mill



Sealed type four-row tapered roller bearings

These bearings are mainly used for the work rolls and intermediate rolls of cold strip mills.

Boundary dimensions (mm)				Basic load ratings (kN)		Fatigue load limit (kN)	Bearing No.	Mass (kg)

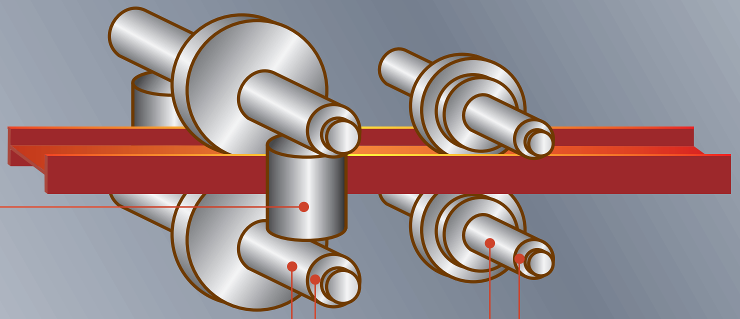
Roll neck bearings for rolling mill

* For information on bearings not listed here, consult with JTEKT.

Shaped-steel rolling mill



Double-row tapered roller bearing

These bearings are mainly used in the V rolls of shaped-steel rolling mills.

Boundary dimensions (mm) Bore diameter	Outside diameter	Cones overall width	Cups overall width	Basic load ratings (kN) C_r	C_{0r}	Fatigue load limit (kN) C_u	Bearing No.	Mass (kg)
240	440	274	224	4 210	6 850	665	46T484427	180
247.65	406	247.65	203	3 520	6 110	603	46CTR504112A	120

Roll neck bearings

These bearings are required to withstand heavy loads and high-speed rotations in severe environments.
At JTEKT, we strive every day to develop bearing materials and technology that minimizes temperature increases and to improve the sealing performance of bearing seals and other similar items in order to meet these needs.

Issues and required performance

- 🟥🟩 Improvement of durability and service life to withstand heavy loads and high-speed rotations
- 🟦 Prevention of the intrusion of water and mill scale

Improvement of durability and service life to withstand heavy loads and high-speed rotations

Long-life / high corrosion-resistant carburized steel

JHS520
JTEKT HYPER STRONG

◆ **Standard**
By using our newly developed case-hardening steel in the bearing rings, we have greatly improved the rolling life, toughness, and corrosion resistance compared to our conventional products.

◆ **Premium**
By using our newly developed case-hardening steel and by applying special heat treatment, we have provided the premium specification with further improved rolling fatigue life and corrosion resistance.

Features
① Long-life and high corrosion-resistant steel with optimized content of chromium and molybdenum
② Original carbonitriding heat treatment improves corrosion-resistance and wear-resistance qualities.

	Results of evaluations of bearings in an environment prone to rust (filled with water-mixed grease)		Results of evaluations of bearings in clean oil
	Rust resistance comparison	Life (JTEKT bench test)	
Conventional product			Developed steel, carburized product ① (JHS520 standard)		 Approx. 2.2 x	 Approx. 4 x
Developed steel, special heat treated product ①+② (JHS520 premium)		 Approx. 3.8 x	 Approx. 7 x
Test conditions	Humidity cabinet test conditions Test temperature: 49°C ± 1°C Relative humidity: 95% or more Test period: 96 hours	Sample: Tapered roller bearing Main dimensions: ø50 × ø120 ×30 Lubrication: Grease (water content ratio, 30%)	Test piece form: 20 mm dia., 32 mm length Maximum contact stress: 5 800 MPa Loading cycle frequency: 285 Hz Lubricating oil: Turbine oil (ISO #VG68) Oil supply: 2 L/min (room temperature) * Test was stopped after 50 × 10^7 times.

Examples of actual use

Cold strip mill work roll (open type) ① [JHS520 standard]

Conventional type

Used approximately 4 million tons (under DS)

Approx. 5 x

No flaking

Cold strip mill work roll (sealed type) ①+② [JHS520 premium]

Conventional type

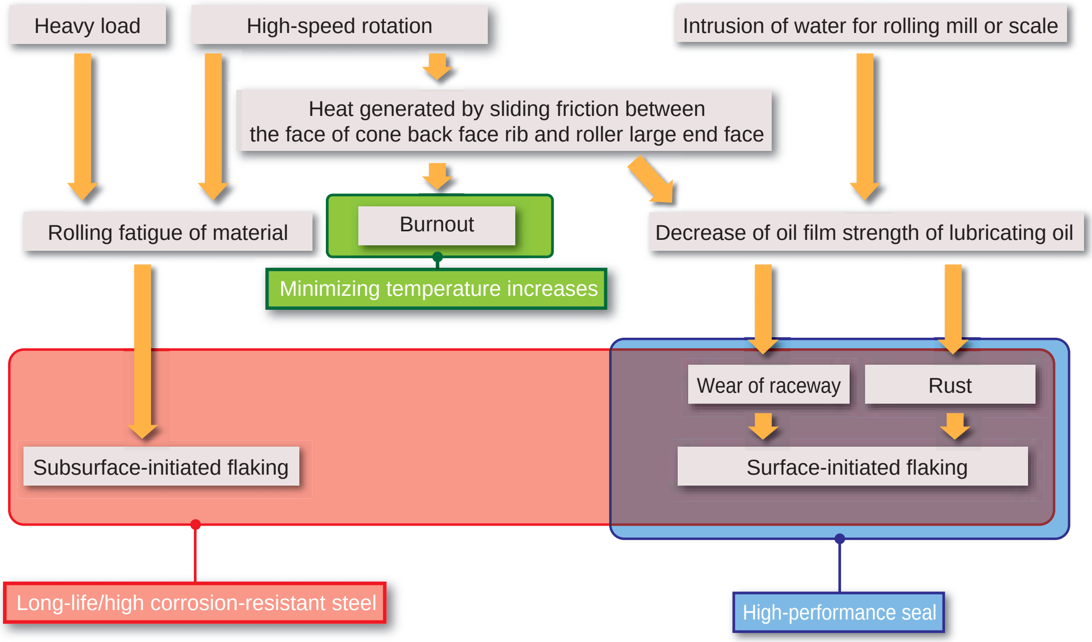
Used for approximately 24 months (under OP)

Approx. 4.8 x

Hardly any indication of rust

Long-life, highly corrosion-resistant JHS is driving innovations in steel production equipment.

Iron manufacturing and rolling mill lines must operate continuously while maintaining high reliability in severe production environments. Answering these needs through the realization of epoch-making long-life and high corrosion resistance is JTEKT Hyper Strong (JHS). By adopting newly developed materials and processes for bearing steel, seal materials and other components, we have realized a 2-to-4-fold increase in bearing service life compared to previously used bearings. Continuing on from JHS520 for rolling mill roll necks and JHS210 for Sendzimir rolling mill backup rolls, we are steadily expanding the bearing series according to each application. The JHS bearing series offers total support for achieving maximum performance and durability in the ever-evolving field of steel equipment. Please keep your expectations high. We won't let you down.



Heavy load

High-speed rotation

Intrusion of water for rolling mill or scale

Heat generated by sliding friction between the face of cone back face rib and roller large end face

Rolling fatigue of material

Burnout

Minimizing temperature increases

Decrease of oil film strength of lubricating oil

Wear of raceway

Rust

Subsurface-initiated flaking

Surface-initiated flaking

Long-life/high corrosion-resistant steel

High-performance seal

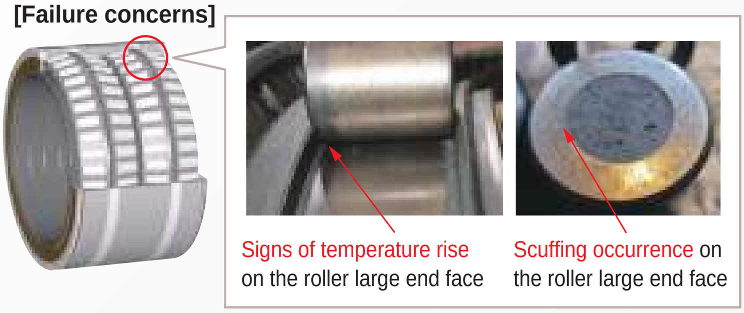
Improvement of durability and service life to withstand heavy loads and high-speed rotations

Technology for minimizing temperature increases

Features

- On the basis of the EHL theory, improvement of the lubrication of the rolling part between the roller large end face and the face of cone back face rib
- Optimization of the shapes and suppression of temperature rising for the rolling part between the roller large end face and the face of cone back face rib

[Failure concerns]

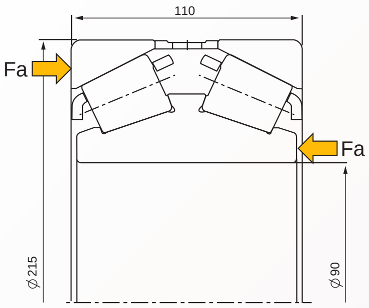


Signs of temperature rise on the roller large end face

Scuffing occurrence on the roller large end face

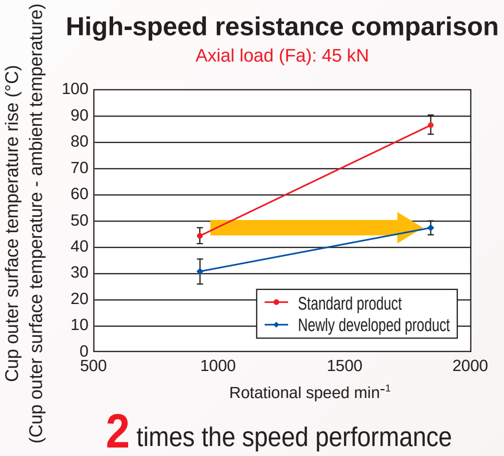
Test bearing

Bearing No.: 45T182211
Main dimensions: ø90 × ø215 ×110 mm
Ca: 228 kN
Lubrication: Grease (Palmax RBG)



High-speed resistance comparison

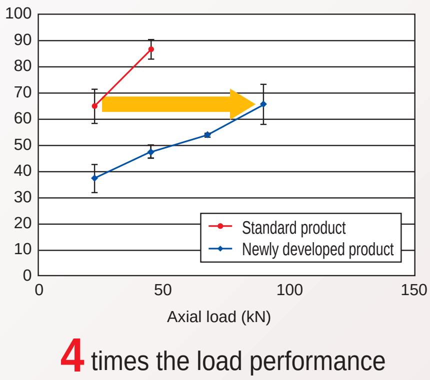
Axial load (Fa): 45 kN



2 times the speed performance
(at the same temperature rise)

Load resistance comparison

Rotational speed: 1840 min⁻¹

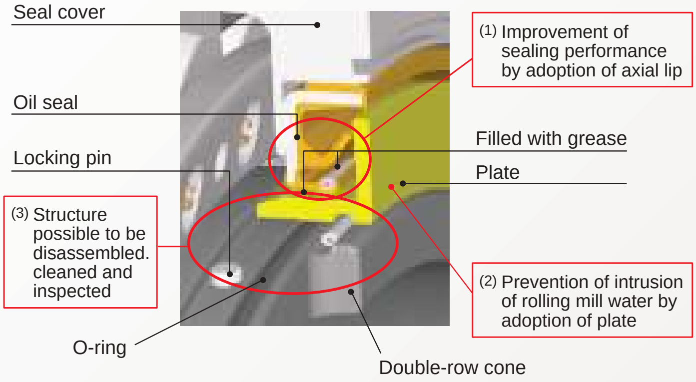


4 times the load performance
(at the same temperature rise)

Prevention of the intrusion of water and scale

High-performance seal

JTEKT dramatically extended bearing life by completely preventing the intrusion of rolling mill water and/or scale into the bearing, which is the major cause of failure through the use of enhanced seals. Moreover, maintenance interval has been also lengthened by maintaining high sealing performance. This product was developed by collaboration of JTEKT and Koyo Sealing Techno Co.,Ltd. in JTEKT group.



The tables below show the appearance status and application history of bearing with high-performance seal adopted. Low water content in the grease and little to no rust generation is proof of excellent sealing performance.

	Before cleaning of grease	After cleaning of grease
Cup		
Cone assembly		

Post-use appearance of bearing with high-performance seal

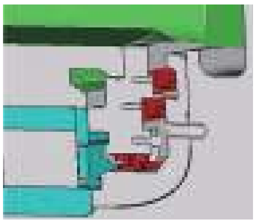
Application	Hot strip mill work roll
Service period	1 486 h (Without any maintenance or re-greasing)
Bearing appearance	Good, no flaking and slight wear
Grease penetration	About 280 (New : 300)
Water content in grease	About 1%

Application history of bearing with high-performance seal

Oil Seal

JTEKT can supply oil seals for various purposes for rolling mills or feeding tables.

Features of Koyo oil seal



1. Lightweight, compact, and energy-saving

- Koyo oil seals offer high sealing performance, while being compact with reduced seal width.

2. High sealing performance by optimum lip design

- Koyo oil seals adopt a linear-contact lip, which provides proper radial lip load.
- The lip design ensures excellent sealing performance, low torque, proper flexibility and high allowability for eccentricity.

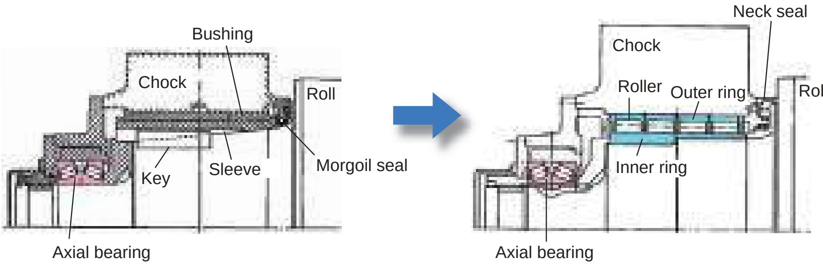
3. Low heat generation and long service life by highly self-lubricating rubber materials

- These products show limited chemical changes such as hardening, softening, and aging.
- These materials, having excellent durability, can offer long service life with less heat generation even under high-lip speed.

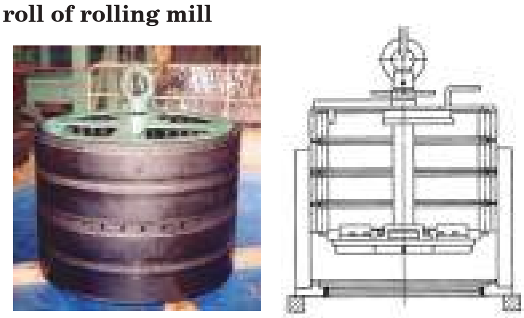
For details of oil seals, see CAT.NO.R2001E.

Replacing oil film bearing with rolling bearing

In 1972, JTEKT adopted four-row cylindrical roller bearings for new cold tandem mill tandem back-up rolls (BUR) at first in Japan. Since then, JTEKT has supplied bearings for BUR to many steel manufacturers all over the world. Since JTEKT carried out the modification design and delivered rolling bearings for the modification of the plate mill by replacing the oil film bearing of the back-up roll with the rolling bearing in 1984, JTEKT has completed about twenty-seven projects (maximum record in Japan) until 2014 and has contributed to offer highly-precise products for rolling mills.



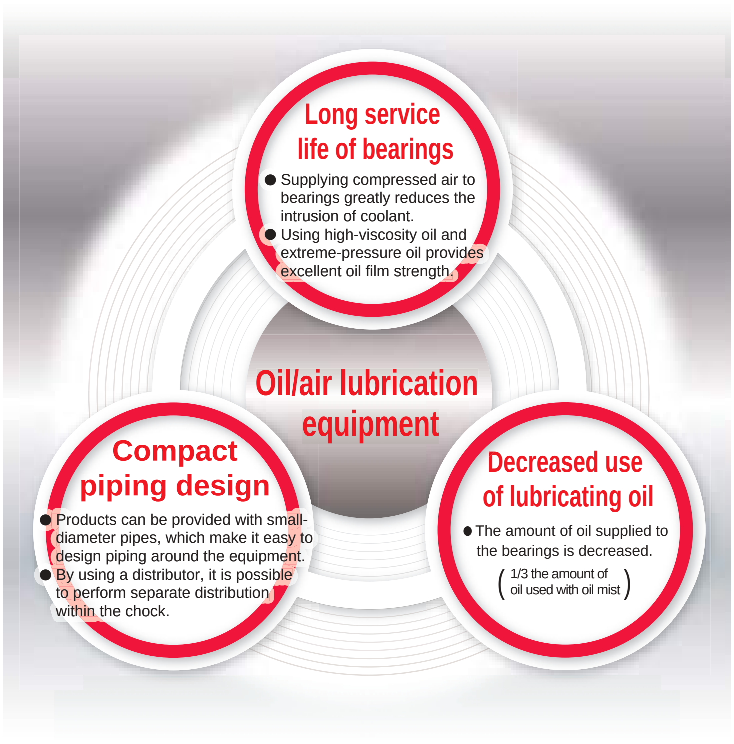
Replacement of oil film bearing with rolling bearing for back-up roll of rolling mill



Lifting tool for rolling bearing assembly

Oil / air lubrication for steelmaking equipment

By improving the lubrication of bearings used in severe environments such as rolling mills and continuous casting machines, JTEKT provides support for these environments.



Long service life of bearings

- Supplying compressed air to bearings greatly reduces the intrusion of coolant.
- Using high-viscosity oil and extreme-pressure oil provides excellent oil film strength.

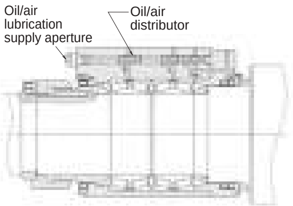
Oil/air lubrication equipment

Compact piping design

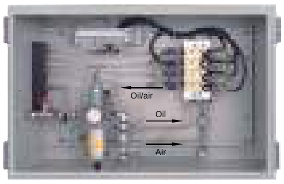
- Products can be provided with small-diameter pipes, which make it easy to design piping around the equipment.
- By using a distributor, it is possible to perform separate distribution within the chock.

Decreased use of lubricating oil

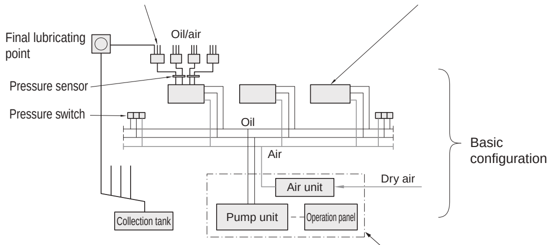
- The amount of oil supplied to the bearings is decreased.
  (1/3 the amount of oil used with oil mist)



Oil/air distributor



Mixing panel



Lubricated object	Rolling mill roll neck bearing Rolling mill auxiliary roll bearing Continuous casting machine guide roll bearing Feed roll bearing, etc.
Tank capacity	From 250 to 2 000 L
Number of lubricating points	1 000 points or more are available
Alarm unit	Respective sections in main unit End of oil and air piping
Lubricated oil q'ty	$Q = 0.085 \cdot d \cdot R / A$ Q : Lubricated oil q'ty cm^3/hour d : Bearing bore diameter mm R : Bearing row number A : Speed coefficient (normally $A = 5$)

Main unit

Handling bearings

This section provides an overview of how to overhaul, assemble, and inspect bearings. We hope this information will be of use to you in maintaining your bearings.

Precautions before opening the package and installing bearings

(1) Do not open the bearing packaging or wrapping until right before you install the bearing.

(2) Make the work area where you will install the bearing as clean as possible, and prevent foreign materials such as trash, dust, and iron powder from adhering to the bearing.

(3) When removing a sealed type bearing from its wooden box, exercise sufficient caution to prevent the oil seal attached to the seal cover from being damaged.

(4) Handle the bearing gently and do not subject it to impacts or shocks.

(5) Thoroughly clean the roll neck and the chock to ensure that no trash or other foreign material is affixed to them.

(6) Sufficiently check that the roll neck diameter and chock inner diameter dimensions are within the permissible tolerances or that the chamfer dimensions of the roll neck diameter and chock inner diameter are the prescribed dimensions before beginning work.

(7) For sealed type bearings that have been stored for a long period of time (3 years or longer), we recommend that you replace the grease with new one.

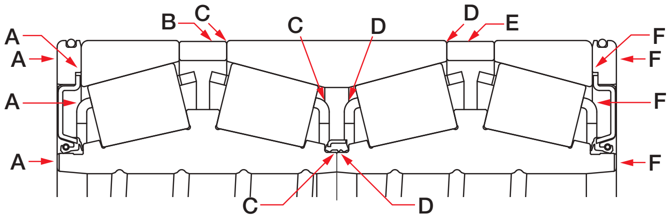
Required tools

Lifting tool	• A tool for lifting the entire bearing assembly • Use this tool when installing the bearing into a chock or when removing the bearing from a chock.
Timber	• Use this tool when putting down the bearing. • This tool can also be used to create a space in which to insert the claws of the lifting tool under the base of the bearing.
Gauge	Use this tool to accurately measure the amount of lubricant to enclose inside a sealed type bearing.
Brass rod	• Use this tool when lightly striking the bearing such as when installing the bearing into a chock or when removing the bearing from a chock. • You can use a plastic hammer or a similar tool as a replacement so long as this tool is soft.

Bearing symbols

In addition to the bearing number, the bearing serial number (combination number) and the row number are also displayed on the bearing.

Assemble the bearing according to these numbers. Mistaking these numbers and assembling the bearing may lead to bearing failure.



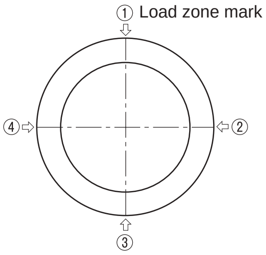
Example VG-10-1

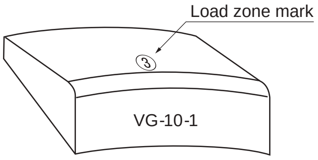
Serial number — Row number

Display position	Number displayed (example)
A	VG-10-1
B	VG-10-1~2
C	VG-10-2
D	VG-10-3
E	VG-10-3~4
F	VG-10-4

Serial number and row number display positions

Load zone marks are displayed on the bearing outside surface. If you change the load zone (the cup loading range) each time that you recombine the bearing after overhauling and cleaning it, you will be able to use the bearing for a longer length of time.





Bearing installation and removal

(1) Open the bearing packaging, and then align the marking-off line displayed on the outside surface of the bearing or the load zone mark with each row.
(2) Check that the oil seal and O-ring are in the correct states.
(3) Fix the bearing in place with a bearing lifting tool like that shown in the figure on the right.
For sealed type bearings, we recommend that you use a lifting tool that makes it easy to install the bearing into a chock.
(4) Apply grease to the bore surface of the chock to enable smooth installation of the bearing.
(5) Check the load zone (first, align load zone No.① [see the figure on the right] with the top of the loading range), and then use the lifting tool and wires along with a hoist or a similar tool to install the bearing into the chock. If the bearing is slanted and can no longer move during the installation, lightly strike the bearing with a brass rod or a similar tool to correct the bearing's orientation. In this situation, be careful to prevent the oil seal from being damaged.
(6) Confirm that the bearing has been installed in the prescribed position, and then remove the lifting tool.
(7) Attach the chock cover to the chock in the same manner as conventional method.
(8) Before mounting the chock, in which the bearing has been installed, into the roll neck, apply a sufficient amount of grease (or a similar lubricant) with molybdenum disulfide to the cone bore and roll neck surfaces.
(9) To remove the bearing, attach the lifting tool to the bearing, and then pull the bearing out from the chock.

Bearing overhaul and inspection interval

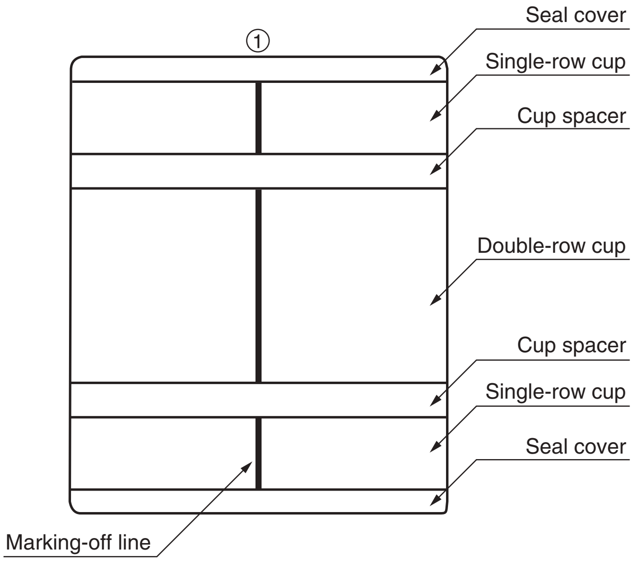
For sealed type bearings, the operating environment varies depending on the type of the rolling mill used and on the stand. It is not possible to determine a uniform interval for the overhaul and inspection (overhaul → cleaning → assembly) of the bearing.

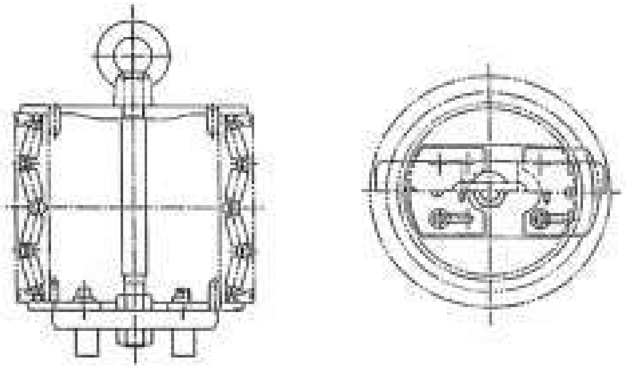
Therefore, in order to determine the period of continuous use, it is necessary to inspect the internal status of the bearing by first setting a short overhaul and inspection interval, and then gradually increasing this interval.

Routine inspections are also necessary.

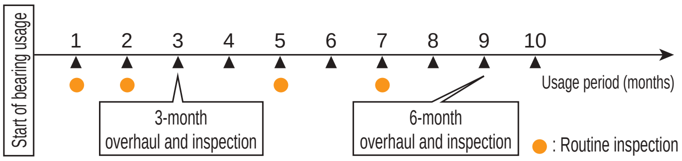
Gradually increase the usage period by changing the overhaul and inspection interval to 3 months and then to 6 months.

After the 6-month overhaul and inspection interval, determine the period of continuous use while observing the status of the bearing.





Bearing lifting tool



Routine inspection

Until the period of continuous use of the bearing is determined, inspect the inside of the bearing by removing the chock cover and just the seal cover and the first row of the cup. Perform this routine inspection between the overhaul and inspection operations. If there are no problems, reassemble the bearing and continue operations. If you find a failure, perform an overhaul and inspection.

Cleaning the bearing

The main points when cleaning the bearing during an overhaul and inspection are shown below.

(1) Before washing the bearing, use your hands or a spatula to remove as much of the grease that has affixed to the bearing as possible.
(2) Separate the washing into two steps: rough washing and finishing washing.

Handling bearings

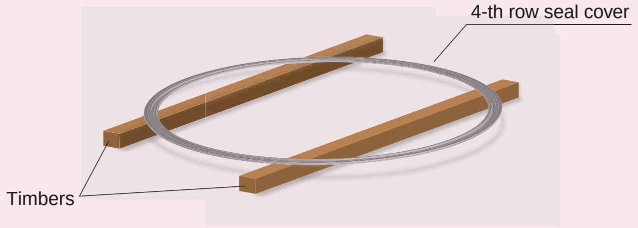
This section provides an overview of how to overhaul, assemble, and inspect bearings.
We hope this information will be of use to you in maintaining your bearings.

Bearing assembly (1)

This section provides the procedure to follow to assemble the bearing after overhauling and cleaning it.

(1) Use an air blower to dry off the washing oil that has affixed to the bearing, and then wipe down the bearing with a rag or similar object.

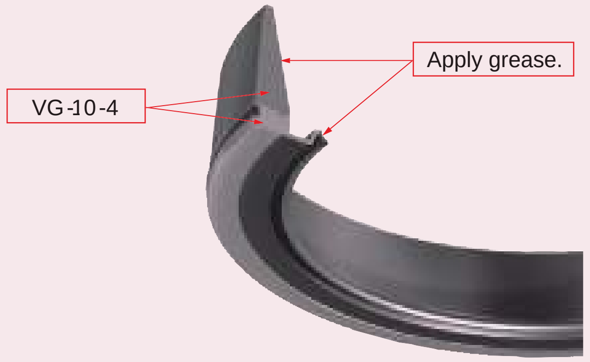
(2) Place the 4th-row seal cover onto two timbers.



(3) Attach the prescribed O-ring to the outside groove of the seal cover.

(4) Place the 4th-row single cup onto the 4th-row seal cover.

(5) Apply bearing sealing grease to the oil seal lip embedded in the seal cover. (For the brand of the grease, see the provided figure.)

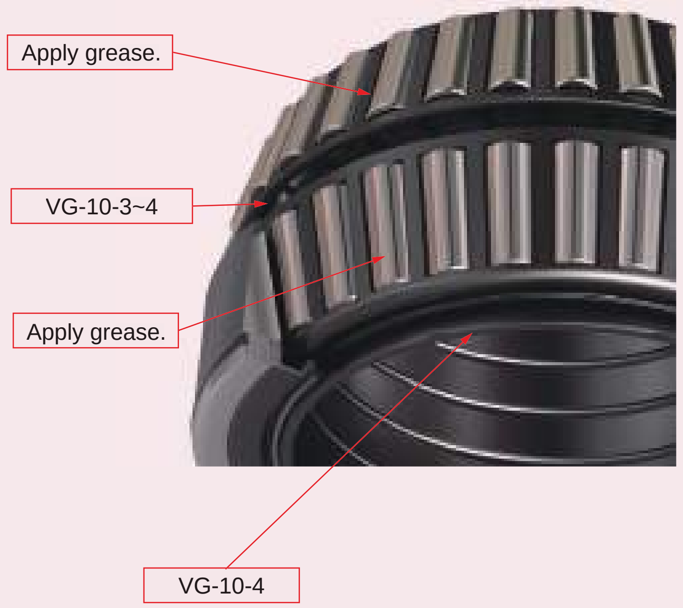


(6) Apply a light layer of bearing sealing grease to the raceway surface of the 4th-row single cup.

(7) Apply approximately 1/3 of the grease for the entire bearing in the space between rollers, the cage, the cone raceway and rib of the cone assembly of the 3rd and 4th rows.
Apply the grease while rotating the rollers and the cage.

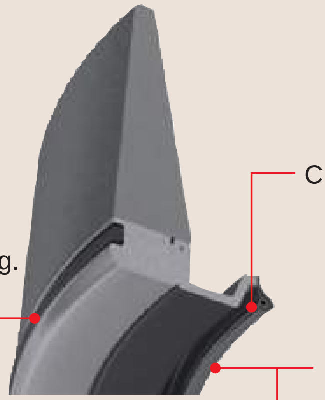
(8) Orient the part so that the 4th row is on the bottom, and then place the cone assembly on top of the 4th-row single cup. In this situation, be careful to prevent the oil seal lip attached to the seal cover from being damaged while you assemble the parts.

(9) Place the 3rd to 4th-row cup spacer on top of the 4th-row single cup. The cup spacer does not have a top or bottom.



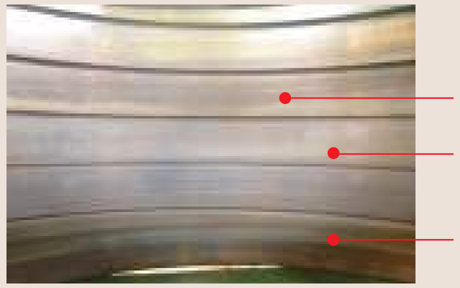
Key points for inspecting parts (1)

Oil seal, O-ring



Check for breaking of the seal lip spring.
Check for breaking of the O-ring.
Check for wear and hardening of the seal lip.
Check for cracking and chipping of the seal lip.

Cone, rollers



Check the degree of wear on the cone bore surface.
Check for rust.
Check for cracking or chipping.

Check for discoloration caused by heat.

Check for scuffing on the roller end faces.

Check the degree of wear on the end face of cone.
Check for heat cracks.

Handling bearings

**This section provides an overview of how to overhaul, assemble, and inspect bearings.
We hope this information will be of use to you in maintaining your bearings.**

Bearing assembly (2)

(10) Apply a light layer of grease to the raceway of the double cup in the 2nd- and 3rd-row.

(11) Orient the part so that the 3rd row of the double cup is on the bottom, and then place this on the cone assembly. Ensure that the load zone marks of the double cup and of the single cup in the 4th-row are aligned.

(12) Attach the oil seal between the cones. Apply bearing sealing grease to the oil seal before attaching it.

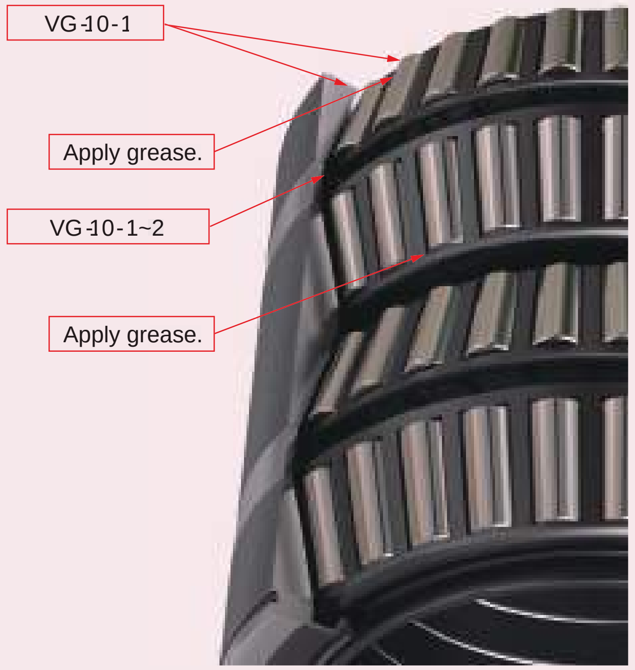
(13) In the same manner as the cone assembly of the 3rd and 4th rows, apply approximately 1/3 of the grease for the entire bearing in the space between rollers, the cage, the cone raceway and rib of the cone assembly of the 1st and 2nd rows. Apply the grease while rotating the rollers and the cage.

(14) Orient the part so that the 2nd row is on the bottom, and then place it on top of the other cone assemblies. Check that the cones are stacked so that there is no space between them.

(15) Place the 1st to 2nd-row cup spacer on top of the assembled parts on the side of the 2nd-row single cup. The cup spacer does not have a top or bottom.

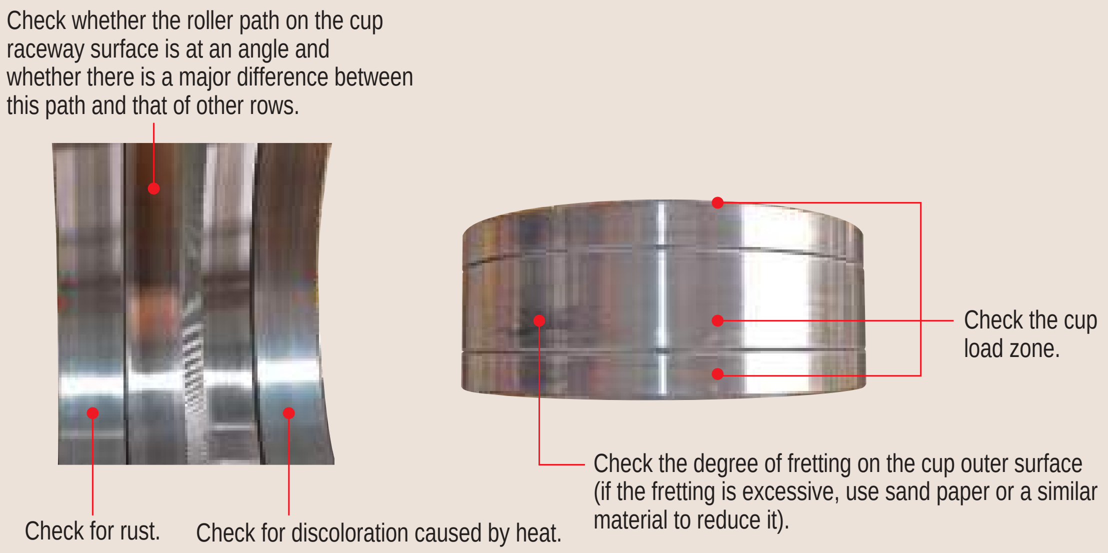
(16) Apply a light layer of grease to the raceway of the single cup in the 1st-row.

(17) Place the 1st-row single cup on top of the 1st to 2nd-row cup spacer. Ensure that the outside surface load zone mark is aligned with the same position of the three other rows.

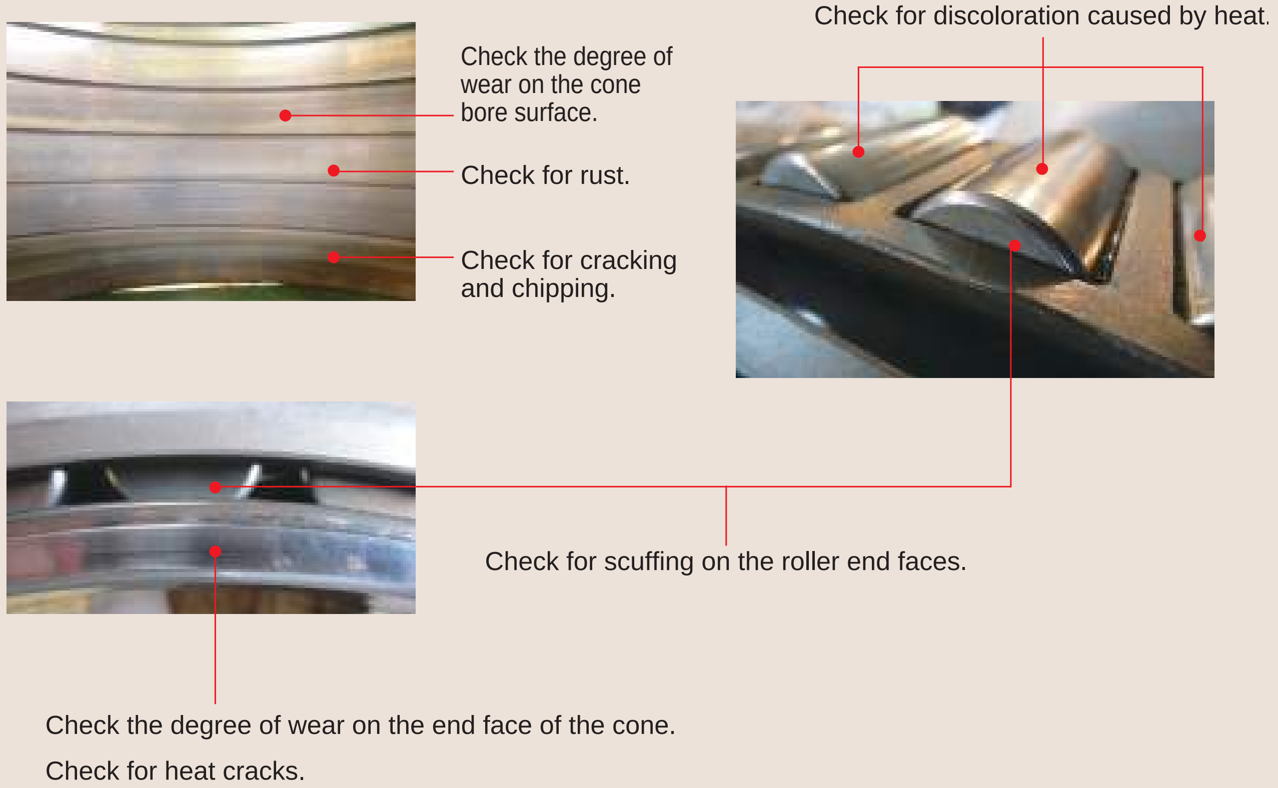


Key points for inspecting parts (2)

Cup



Cone, rollers



Handling bearings

**This section provides an overview of how to overhaul, assemble, and inspect bearings.
We hope this information will be of use to you in maintaining your bearings.**

Bearing assembly (3)

(18) Apply grease to the oil seal lip embedded in the seal cover of the 1st row.

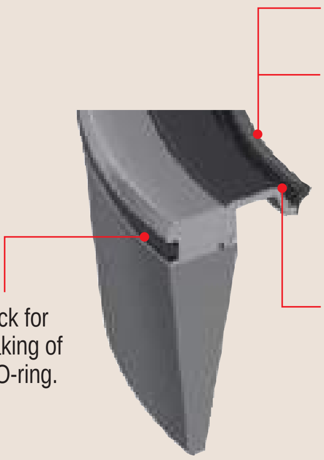
(19) Attach the 1st-row seal cover onto the top of the 1st-row single cup.

(20) Attach the prescribed O-ring to the outside groove of the 1st-row seal cover.

(21) To overhaul the bearing, perform this procedure in the reverse order.

Key points for inspecting parts (3)

Oil seal, O-ring



Check for wear and hardening of the seal lip.

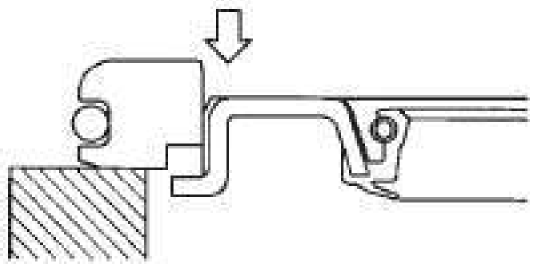
Check for cracking and chipping of the seal lip.

Check for breaking of the O-ring.

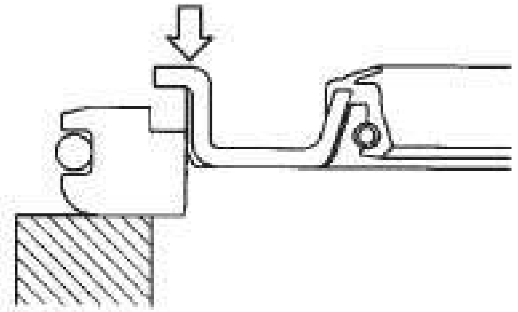
Check for breaking of the seal lip spring.

Attaching and removing the oil seal

(1) To remove the oil seal, strike the side of the oil seal with a hammer or a similar tool.



(2) To attach a new oil seal, apply grease to the outside surface of the oil seal, and then use a support ring or a similar tool to evenly push the oil seal into the seal cover.
Exercise caution when handling the oil seal at this time, as striking it with too much force may lead to deformations.



Bearing failures, causes and countermeasures

Failures | **Characteristics**

1

Flaking

Flaking caused by excessive axial load

(Cones of four-row tapered roller bearing)

Damages

Flaking on bearing raceway surface generated on only rows receiving axial load

Causes

1) Crossed work rolls causing excessive axial load
   - · Roll neck diameter is smaller than the standard one.
   - · Chock side liner is worn.
   - · Inaccuracy of mill stand.
   - · Rigidity of the chock is poor.
   - · Corrosion on liner or clearance generated between the liner and the chock.
   - · Failure of the keeper plate.

Countermeasures

1) Keep the correct locations of the chock and work roll.

(Cup raceway of four-row tapered roller bearing)

Damages

Flaking generated and developed from raceway end face

Causes

1) Looseness of chock cover/excessive axial clearance.
   (As the axial clearance is increased, the loading range becomes narrower, partial load acts, and edge load is generated on the cup raceway.)
2) Excessive axial clearance is generated because of the mixed use of other bearing spacer or cup.

Countermeasures

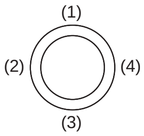
1) Adjust shims, select thickness of shims, measure a gap, and tighten bolts correctly.
2) Use parts of the same number.

Flaking caused by improper mounting

Load zone (1) Load zone (2)

Load zone (3) Load zone (4)

(Cup raceway of four-row tapered roller bearing)



Damages

Flaking on raceway surface with slanted contact

Causes

1) It occurs when the chock is fixed inappropriately and slantingly.
   - · Failure of keeper plate
     Removal, looseness, damage, deformation, bend, unequal tightening, unequal wear, improper parallelism.
   - · Damaged, deformed, or bent chock flange.

Countermeasures

1) Find the cause of damage by periodic inspection of the chock and stand.

Bearing failures, causes and countermeasures

Failures	Characteristics		
1 **Flaking**	**Flaking at corroded start point**  (Cup raceway of four-row tapered roller bearing)	**Damages**	Flaking on raceway surface started from corroded (rusted) portion
		Causes	1) After the bearing was used, it has been left for a long period with moisture mixed in grease. 2) Improper rust preventive treatment after the bearing was washed. 3) Worn or damaged seal lips. 4) Corrosion on the raceway is generated due to the clearance between the roll neck and the sleeve, and flaking occurs with rust.
		Countermeasures	1) Improve seal maintenance and sealing method. Periodically check for wear or damage on the seal lips. 2) Fit the “O” ring between the roll neck and the sleeve. 3) Immediately after the bearing is removed from the chock, change grease. 4) After washing the bearing, remove kerosene and water completely.
	Flaking on nicks (scratch) start point  (Rolling contact surface of four-row cylindrical roller bearing)	**Damages**	Flaking on rolling contact surface with nicks start point
		Causes	1) Inappropriate handling · Mounting / dismounting bearing to / from chock. · Replacing roll.
		Countermeasures	1) Proper handling jig (use of a copper hammer). 2) Prevention of impact load when replacing roll (use of soft material). 3) Improvement in mounting method. 4) Change in raceway chamfering.
	 (Inner ring raceway of double-row cylindrical roller bearing)	**Damages**	Flaking on raceway surface
		Causes	1) Low viscosity oil lubrication (improper lubrication). 2) Ingress of dusts and foreign matters.
		Countermeasures	1) Improvement in viscosity of oil and oil type. 2) Improvement in seal maintenance and sealing method. Periodic check of wear or damage of seal lip. 3) Check of oil filter.
2 **Cracking** **Chipping**	 (Cone side face of four-row tapered roller bearing)	**Damages**	Minute crack on cone side face
		Causes	1) Fix the cone and the roll with a fillet ring (thrust collar). 2) Clearance between the fillet ring (thrust collar) and the cone is excessively small. 3) Area of the side face of nut/slinger contacting the cone side face is too small, the side face is worn due to cone creep, causing heat.
		Countermeasures	1) Keep the clearance between the cone and the fillet ring (thrust collar) (from 0.5 mm to 1.5 mm). 2) Keep the area of the side of fillet ring (thrust collar) (to reduce pressure on the side face). 3) Apply and supply grease of adequate amount.

Failures | **Characteristics**

2

Cracking Chipping

(Rolling contact surface of four-row cylindrical roller bearing)

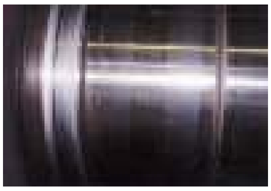
Damages Cracking on rolling elements

Causes

1) Application of load greater than bearing load rating (Load resistance of roller by use of pin type cage)
2) Secondary factor in case of damaged pin of cage (For a reversible mill, pins are broken due to fatigue caused by rapid acceleration and deceleration)
3) Other factors
   - · Ingress of water due to faulty sealing.
   - · Increase of axial clearance of bearing, causing application of partial and excessive load.

Countermeasures

1) Optimal design of bearing considering load and operating conditions (Examination of optimal cage type)
2) Reviewing sealing method and design of strength of cover.



(Inner ring raceway of four-row cylindrical roller bearing)

(Inner ring raceway of four-row cylindrical roller bearing)

Damages Grinding burn or crack on inner ring raceway surface

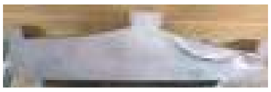
Causes

1) After fitting an inner ring into the roll neck, grinding burn occurs during grinding with the inner ring and the roll.
2) Crack occurs because rollers rolling on the raceway surface of which strength (hardness) is decreased due to grinding burn.

Countermeasures

1) Reviewing grinding conditions Grain size of grinding stone, grinding stone cutting amount, cutting pressure, grinding fluid amount, etc.

(Inner ring of spherical roller bearing)



(Fractured section of inner ring)

Damages Axial crack occurs on bore surface of inner ring and raceway surface.

Causes

1) Excessive interference between inner ring and shaft.
2) Great fit stress due to excessive difference in temperature of inner ring and that of shaft.

Countermeasures

1) Appropriate fit conditions of inner ring and shaft.
2) Appropriate difference in temperature by checking load, rotation, and temperature conditions. (appropriate fit)

(Cone bore surface of four-row tapered roller bearing)

Damages Circumferential crack occurs on bore surface and raceway surface of cone.

Causes

1) Step wear occurs on the shaft (roll neck), and the cone overrides the shaft, causing great bore surface stress.

Countermeasures

1) Provide circumferential groove for the roll neck.
2) When using a bearing with different chamfers for a roll, make the chamfers identical.

Bearing failures, causes and countermeasures

Failures **Characteristics**

2

Cracking Chipping

(Cup raceway of double-row tapered roller bearing)

(Fractured section of cup)

Damages
Axial crack occurs on outside surface and raceway surface of cup.

Causes
1) Excessive axial load.
2) Axial clearance between the bearing and roll is great, and excessive axial load is applied.

Countermeasures
1) Check for axial load.
2) Check the wear condition of counterpart components.
3) Reviewing thickness of the cup

(Shaft race raceway of spherical thrust roller bearing)

(Assembly of spherical thrust roller bearing)

Damages
Crack occurs on shaft race back face rib.

Causes
1) Excessive axial load.
2) Low holding shoulder diameter on the shaft race back face rib.

Countermeasures
1) Reviewing operating conditions.
2) Reviewing dimensions of counterpart collar. (Dimensions allowing backup of shaft race back face rib)

3

Brinelling Nicks

(Double cup raceway surface of four-row tapered roller bearing)

(Rolling contact surface of four-row cylindrical roller bearing)

Damages
1) Brinelling (Nicks) on raceway and rolling contact surfaces (scratch).
2) Brinelling on raceway surface at the same interval as rolling element spacing.

Causes
1) Nicks occur on the raceway and rollers because of improper handling.
   - · Mounting / dismounting bearing to / from chock
   - · Replacing roll
2) Great bending load is applied to the roll neck. (Especially, when faulty rolling occurs)

Countermeasures
1) Proper handling jig (use of a copper hammer).
2) Application of grease to raceway surface of inner and outer rings (cones and cups). (Apply oil if the bearing is the oil lubricated type)
3) Prevention of impact load when replacing roll. (Use of soft material)
4) Roll bending compared to bearing static load rating.
5) Improvement in mounting method.
6) Check for excessive load on the slant chamfer of the raceway surface.

4

Scratch Scuffing

(Roller end face of double-row cylindrical roller bearing)

(Outer ring rib of double-row cylindrical roller bearing)

(Roller large end face of double-row tapered roller bearing)

Damages
Scuffing on roller end face, rib of the raceway

Causes
1) Improper lubrication, ingress of foreign matters.
2) Abnormal axial load caused by improper mounting or control of bearing overall thickness.
3) Excessive axial load.
4) Excessive preload.

Countermeasures
1) Selection of appropriate oil type and supply of adequate lubricant.
2) Reviewing bearing mounting location.
3) Reviewing bearing overall thickness control.
4) Reviewing operating conditions.
5) Checking preload.

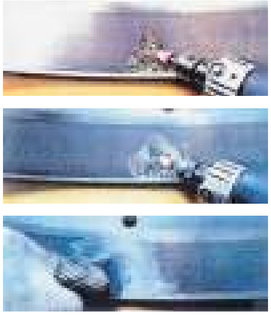
Failures	Characteristics		
5 **Smearing**	 (Cup raceway surface of four-row tapered roller bearing)  (Outer ring raceway surface of spherical roller bearing)  (Outer ring raceway surface of spherical roller bearing)  (Rolling element surface of spherical roller bearing)	**Damages**	Smearing on raceway or rolling contact surface
		Causes	1) Improper lubrication 2) Slip of rolling elements (high speed, light load) 3) Ingress of foreign matters during maintenance
		Countermeasures	1) Selection of appropriate oil type and supply of adequate lubricant 2) Setup of appropriate preload 3) Prevention of ingress of foreign matters
6 **Rust Corrosion**	**Corrosion**  (Cup of four-row tapered roller bearing)  (Cup of four-row tapered roller bearing)	**Damages**	Rust, corrosion on the raceway surface at the same interval as rolling element spacing
		Causes	1) Worn or damaged seal lips 2) Ingress of water or corrosive materials into clearance between roll neck and sleeve
		Countermeasures	1) Improve seal maintenance and sealing method. Periodically check for wear or damage on the seal lips. 2) Fit the "O" ring between the roll neck and the sleeve.
	Rust  (Cup of four-row tapered roller bearing)	**Damages**	Rust on partial or entire surface of bearing
		Causes	1) After the bearing was used, it has been left for a long period with moisture mixed in grease. 2) Improper rust preventive treatment after the bearing was washed.
		Countermeasures	1) Immediately after the bearing is removed from the chock, change grease. 2) After washing the bearing, remove kerosene and water completely.
7 **Creeping**	 (Scuffing on rolling mill roll neck)  (Cone bore surface of four-row tapered roller bearing)	**Damages**	Wear, discoloration, and scuffing due to slip of fitting surface
		Causes	1) Insufficient grease or oil between the cone bore surface and the roll neck outside surface (When creep occurs between the cone and the roll neck, because of loose fit of them.)
		Countermeasures	1) Provide the spiral groove for bore surface of cone 2) When mounting the bearing, apply grease with molybdenum disulfide or EP grease. (Apply oil if the bearing is the oil lubricated type)

Bearing failures, causes and countermeasures

Failures	Characteristics		
8 **Seizure**	 (Rolling contact surface of double-row tapered roller bearing)  (Roller large end face of double-row tapered roller bearing)  (Cone of double-row tapered roller bearing)	**Damages**	Discoloration, deformation, and melting caused by heating in bearing
		Causes	1) Improper lubrication (insufficient or degraded lubricant) 2) Ingress of water due to faulty sealing 3) Excessive axial load 4) Heat generated by creep of cone 5) Ingress of dusts or foreign matters 6) Excessively small bearing internal clearance
		Countermeasures	1) Reviewing sealing type and conditions 2) Reviewing lubricating method and lubricant, and checking lubricated condition 3) Check for axial load 4) Reviewing bearing (type, size, etc.) 5) Reviewing clearance 6) Confirming operating conditions
9 **Failure in lubrication**	 (Cone assembly of four-row tapered roller bearing)	**Damages**	Grease including large quantity of water mixed in
		Causes	1) Operated at high temperature ⇒ Grease is carbonized. 2) Ingress of water due to improper sealing or wear or damage of seal lip (In this example, 20% or more of water is mixed in grease.)
		Countermeasures	1) Find the cause of high temperature. (If the temperature cannot be lowered, review the possibility of change to high temperature grease.) 2) Checking wear or damage of seal lip. Find the cause of and countermeasure against the improper sealing.
	 (Cone assembly of double-row tapered roller bearing)  (Cup of double-row tapered roller bearing)	**Damages**	Foreign matter attachment and corrosion occur because of ingress of a great deal of foreign matters (scale and water for rolling).
		Causes	1) Ingress of water due to improper sealing or wear or damage of seal lip
		Countermeasures	1) Checking wear or damage of seal lip. Find the cause of and countermeasure against the improper sealing.
	 (Four-row tapered roller bearing)	**Damages**	Seizure and adhesion of raceway, roller, and cage
		Causes	1) Varied factors including improper lubrication, improper operation, and ingress of foreign matters occur, causing damages.
		Countermeasures	1) Checking improper operation 2) Checking lubricating conditions 3) Checking degradation of peripheral parts
	 (Outer ring assembly of four-row cylindrical roller bearing)  (Outer ring assembly of four-row cylindrical roller bearing)	**Damages**	Looseness and breaking of pin
		Causes	1) Abnormal load due to vibration occurs. 2) End of cage's service life because of use for a long period
		Countermeasures	1) Checking abnormal vibration 2) Replace if it has been used for a long period.

[Reference]

Repair to portion flaking occurred



❶ **Remove the edges of the portion flaking occurred (with a polishing grinder).**

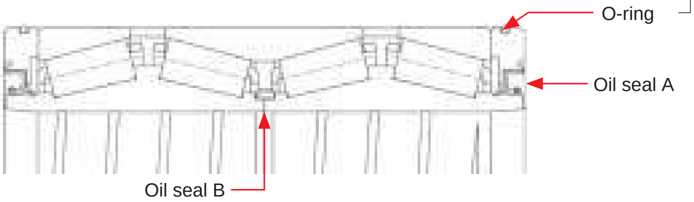
❷ **Finish of the surface of the portion flaking occurred.**

❸ **Finish the surface by lapping the modified portion.**

Modification may not be able to be done depending on the status of the portion flaking occurred. Consult with JTEKT.

Particular cases and damages for sealed type bearing

Checking oil seals and O-rings



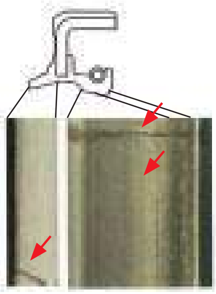
Cut, tearing, and permanent set of O-ring for seal cover

Remedy Replace with new O-rings.

Hardening of oil seal A

Remedy Replacement is recommended.

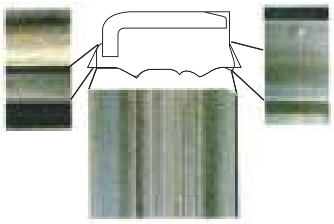
Crack, blister of oil seal A



Remedy ① Replace the oil seal.
(The figure on the left side shows cracks on the sealing lip and minor lip).
② If they occurred in a short period, reviewing operating conditions or examination of change of oil seal material are required.

Abnormal wear to lip of oil seal A

Remedy ① If the interference is restricted, replacement is required.
② When fitting new oil seals, apply grease to the lips generously.



Abnormal wear to side and bore surfaces of oil seal B

Remedy ① If the interference is restricted, replacement is required.
② When fitting new oil seals, apply grease to the side and bore surfaces generously.

Oil seals and O-rings

① Oil seals and O-rings are very important parts to prevent intrusion of water into bearings. Periodic replacement is required, since they are consumables.
② When attaching the oil seal after overhaul and cleaning, be sure to apply grease to the oil seal lips generously.
Service life of seals depends on the grease status.

Technical data

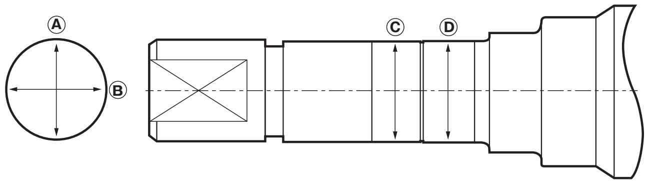
1. Recommended fits for rolling mill roll neck bearing

A roll neck bearing is subject to inner ring rotating load. Its inner ring receives the load on its entire circumference, and the load is applied to the outer ring at only one location.

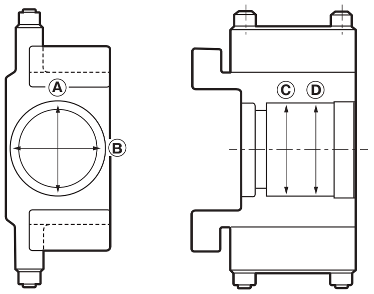
Thus, interference fit is required for the inner ring to prevent any creep, and clearance fit should be used for the outer ring, in principle. For easy attachment, clearance fit has been used for roll neck bearings (because recombination and replacement must be frequently done for roll grinding).

Clearance fit is used for the inner rings of deep groove ball bearings and angular ball bearings used as bearings receiving axial load. Between the outer ring and the chock, adequate clearance should be provided in order to prevent any radial load applied to the outer ring.

Tables 1-1 through 1-4 show the recommended fits for roll neck bearings.



Roll neck



Chock

* For Ⓒ and Ⓓ, measure the dimensions in the Ⓐ and Ⓑ directions.

S_{d} : perpendicularity of inner ring face with respect to the bore

[Notes] 1) These shall be appplied to individual bearing rings manufactured for matched pair or stack bearings.
2) Also applicable to the inner ring with tapered bore of $d \geqq 50$ mm.

[Remark] Values in Italics are prescribed in JTEKT standards.

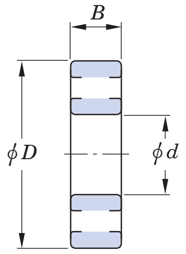
S_D : perpendicularity of outer ring outside surface with respect to the face
S_{ea} : axial runout of assembled bearing outer ring

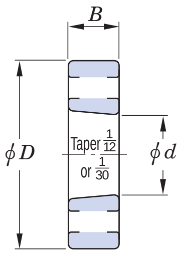
[Notes]

1) Shall be applied when locating snap ring is not fitted.
2) These shall not be applied to flanged bearings.

[Remark]
Values in Italics are prescribed in JTEKT standards.



Cylindrical bore



Tapered bore

d : nominal bore diameter
D : nominal outside diameter
B : nominal assembled bearing width

2-2. Tapered roller bearings

[Applicable tolerance for tapered roller bearings]

Type of tapered roller bearings			Applicable tolerance[1]
Double-row · Four-row	Metric series	45200, 45300, 46200 (A), 46300 (A) 46T30200JR, 46T32200JR, 46T30300JR, 46T32300JR 37200, 47200, 47300	Class 0 of BAS 1002 (Refer to Table 2-3 on page 30)
	Inch series	LM377449D/LM377410, 67388/67322D EE127094D/127138/127139D etc.	Class 4 of ABMA 19 (Refer to Table 2-4 on page 31)
	The others	45T···, 46T···, 47T···, 2TR···, 4TR···	Special tolerances for required are used in many cases. Consult with JTEKT.

[Note] 1) Consult with JTEKT if a higher tolerance class than that shown in this table is necessary.

Table 2-3 Tolerances for metric series double-row and four-row tapered roller bearings (class 0)

= BAS 1002 =

Large size bearing technology development center

At JTEKT, we continue to develop our operations as a global system supplier that can solve the problems of our customers and that can provide our customers with new products based on our accumulated knowledge and having high added value.

Regarding large bearings used in the field of industrial machinery, up to now it was common to perform theoretical examinations, to perform basic evaluations, and to have these bearings evaluated by our customers with using the bearings on actual equipment. As a result, issues such as unexpected problems and extended development time occurred.

At JTEKT, we have established the Large Size Bearing Technology Development Center and we have begun work at this center, which enables us to perform evaluations in which the environments closely resemble those of the actual machines.

The data that we accumulate here will be put to use in improving the accuracy of our CAE analysis (simulation analysis), in greatly reducing the development time of future products, and in developing new products with high added value.

■ Test devices for bearings used in steelmaking equipment

In order to closely approximate the use conditions of actual machinery, this test equipment enables evaluations with spraying water for rolling and under high temperatures. This enables us to proceed with the development of new products having even higher reliability by giving consideration to bearings and oil seals as a complete package.

Drive shafts for steel production/ industrial equipment

CAT.NO.UA002EN-0MY

Drive shafts for steel production/ industrial equipment

Preface

Throughout the manufacturing industry the pursuit of greater power output at higher efficiency is a priority. Under such circumstances, highly sophisticated and economical drive shafts that fit in a limited space are in great demand for use in various equipment and machines.

Drive shaft lineup is certain to satisfy your requirements in various applications, including iron manufacturing machines, rolling mills, construction machines, and rolling stock.

We thank you in advance for your support of our drive shafts.

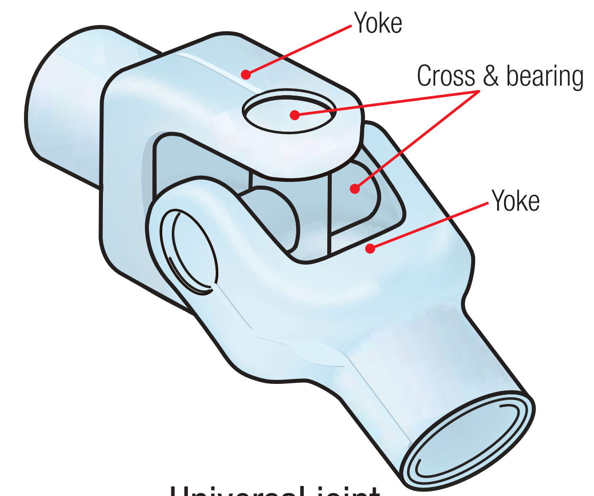
Introduction to drive shafts

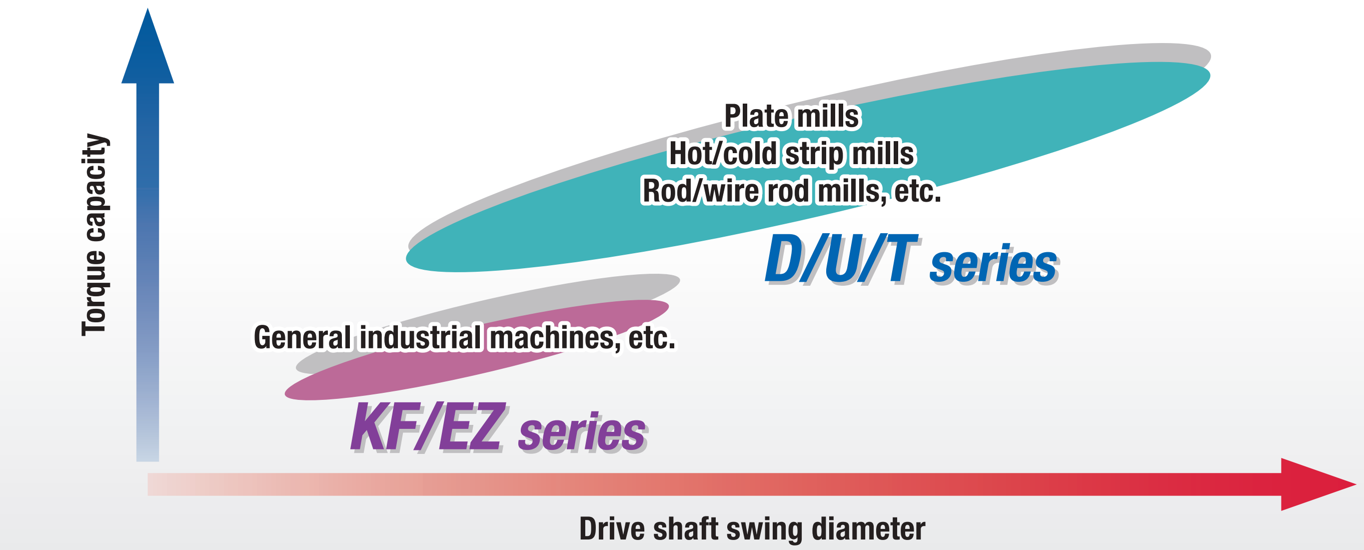
Functions

A drive shaft is a revolving shaft used to transmit the power of a motor to a machine.
Since it is installed in a limited space, the axes are seldom aligned.
However, by using a universal joint, the input axis and the output axis can be flexibly connected even in a limited space, enabling smooth torque transmission.
Each universal joint has four rolling bearings (cross & bearing), realizing low friction and minimizing torque losses.



Universal joint
(Cross-type universal joint)

Position of each series of drive shafts



Configuration of parts

1) Cross & bearings
The cross & bearings are the most critical components of a drive shaft.
A cross & bearing has a cross-shaped shaft and four rolling bearings that individually support each end of the shaft.

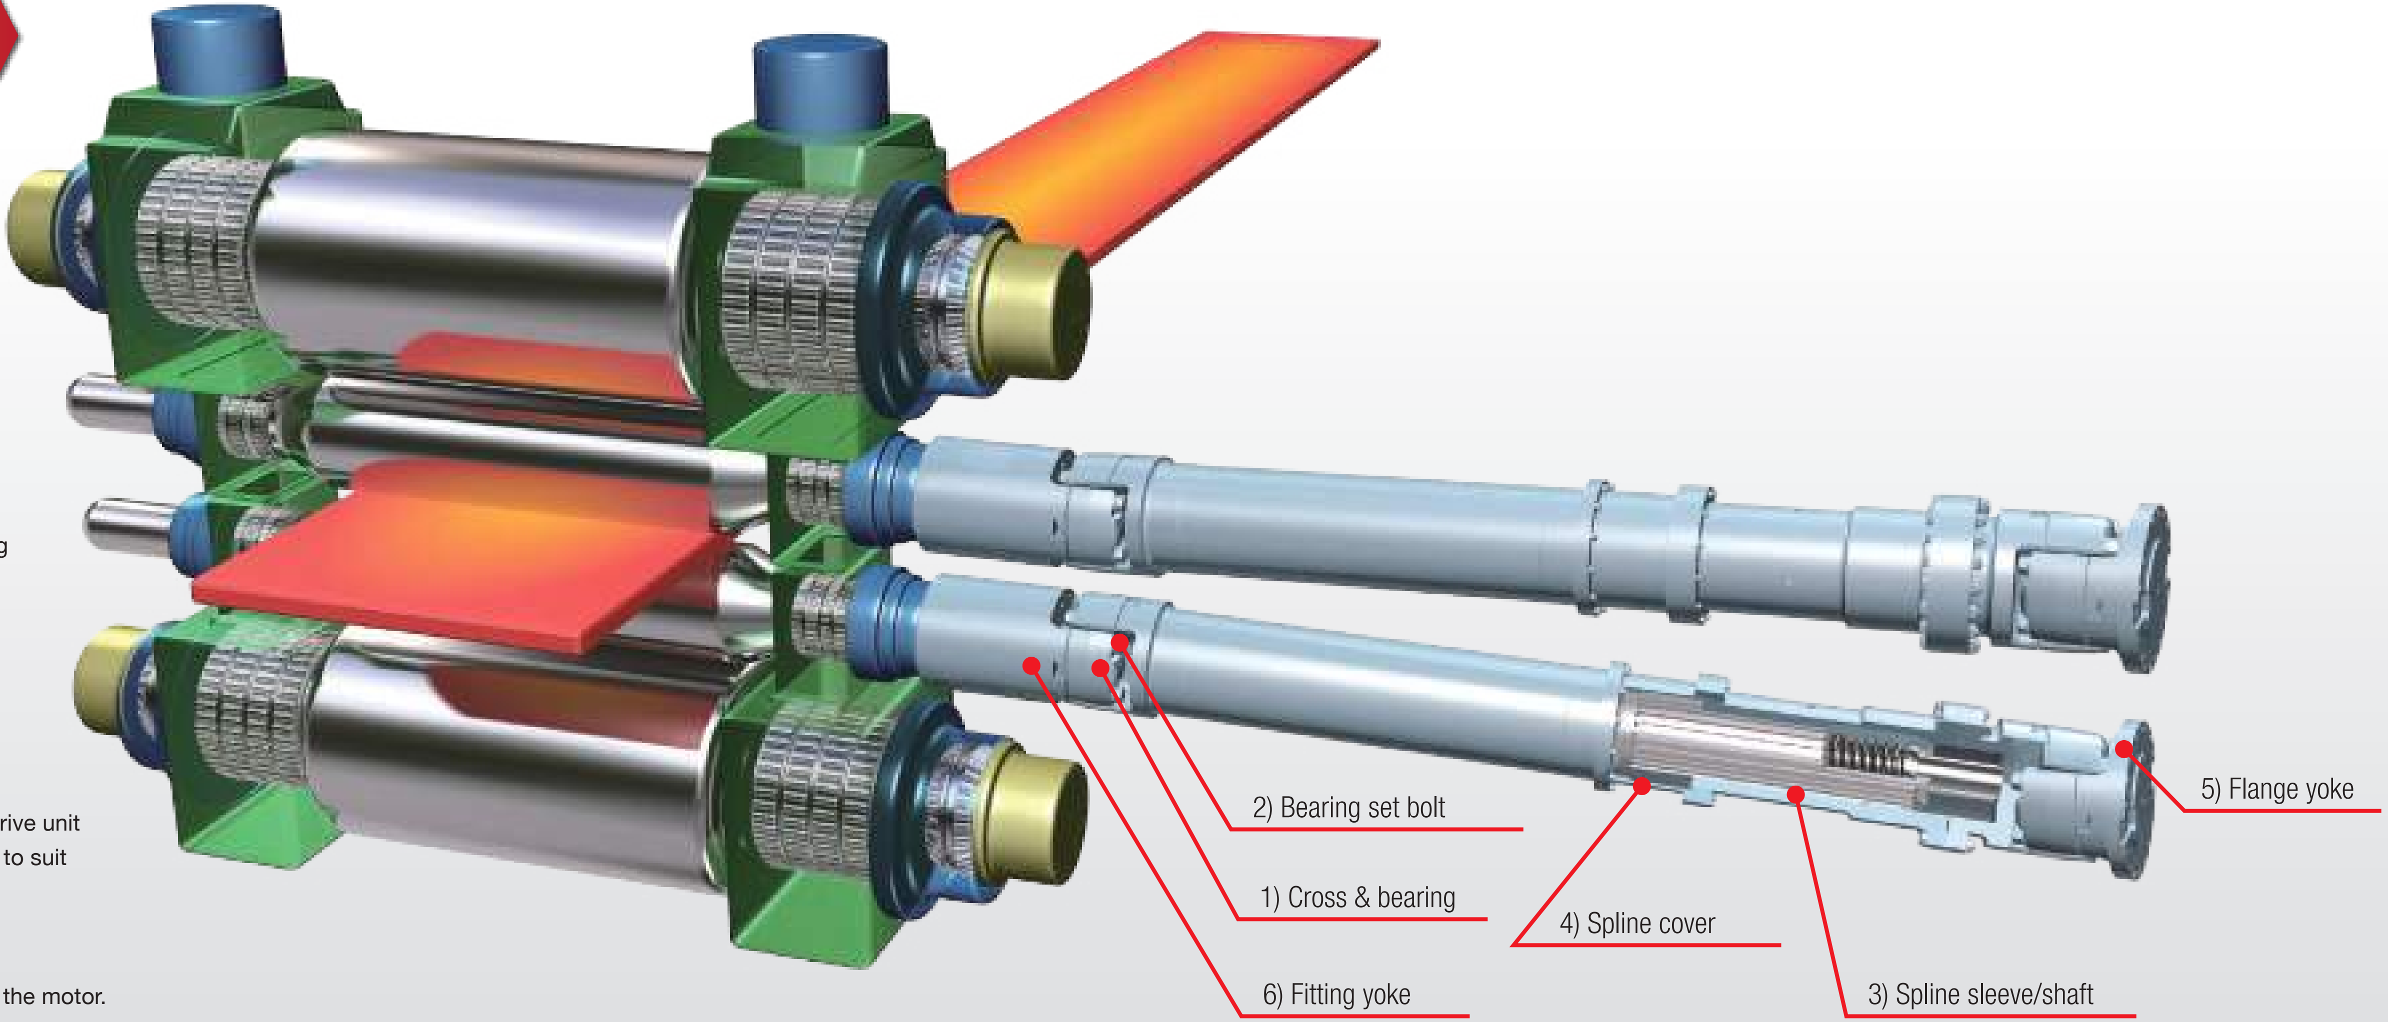
2) Bearing set bolt
Used to connect the cross bearing and its mating part.

3) Spline sleeve/shaft
There are a spline hole and shaft and the attaching length is adjustable.

4) Spline cover
Used to improve the dustproof and waterproof properties if the ambient environment is not good.

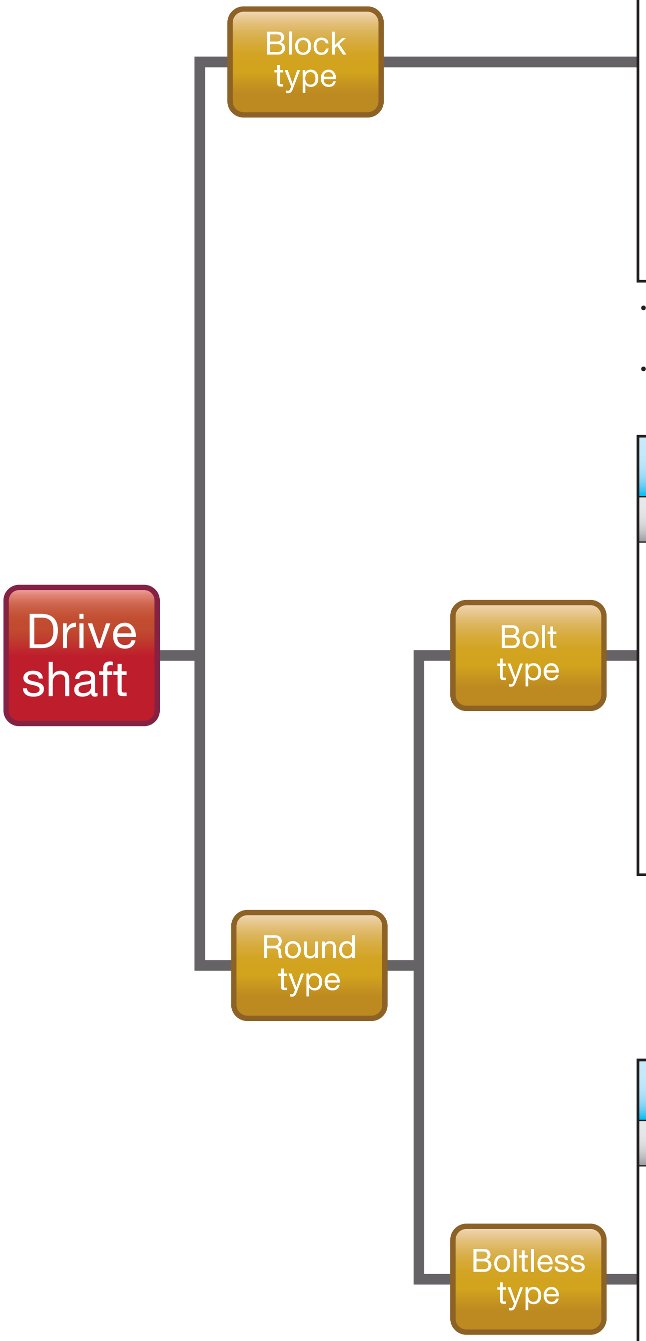
5) Flange yoke
The flange yoke is commonly used to connect a drive unit (such as a motor). A variety of joints are available to suit specifically desired applications.

6) Fitting yoke
Used mainly for connection with the machine and the motor.
Various types of coupling arrangements are provided according to the application.



Configurations of drive shafts

Drive shafts are classified into two types: block drive shafts and round drive shafts according to the structure of the cross & bearings used for the universal joint. Features and representative structures of each type are shown below.



D/U/T series

Features	Characteristics
(1) These series are intended for use in extremely heavy duty applications. (2) High dust resistance makes these series optimal for use under severe operating conditions such as in rolling mills.	(1) Swing diameter (mm) : ϕ160 - 1230
	(2) Torque T_D(kN·m) : 10.9 - 8970
	(3) Torque T_S(kN·m) : 34.1 - 18800
	(4) Maximum operating angle (°) : 4 - 10

- T_D indicates the judgment standard torque for the maximum torque (maximum under normal conditions).
- T_S indicates the judgment standard torque for the breakaway torque (maximum under abnormal conditions).

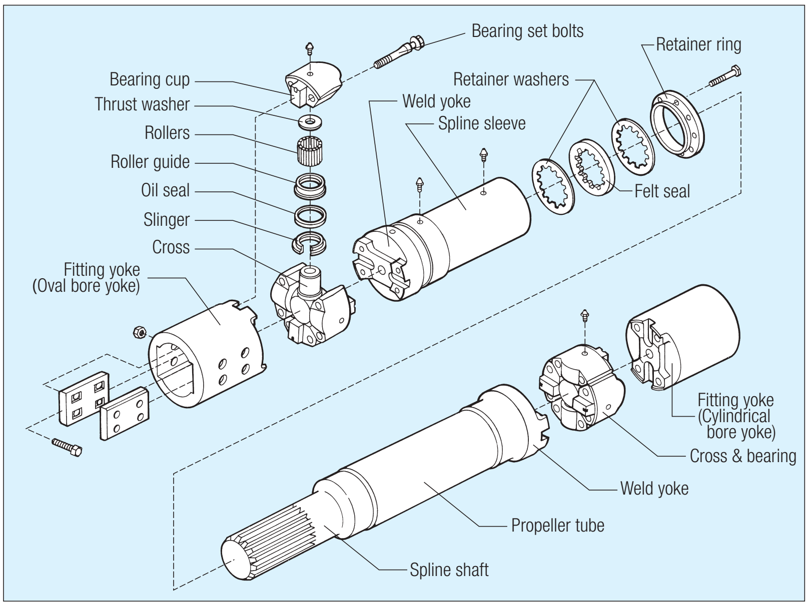
EZ series

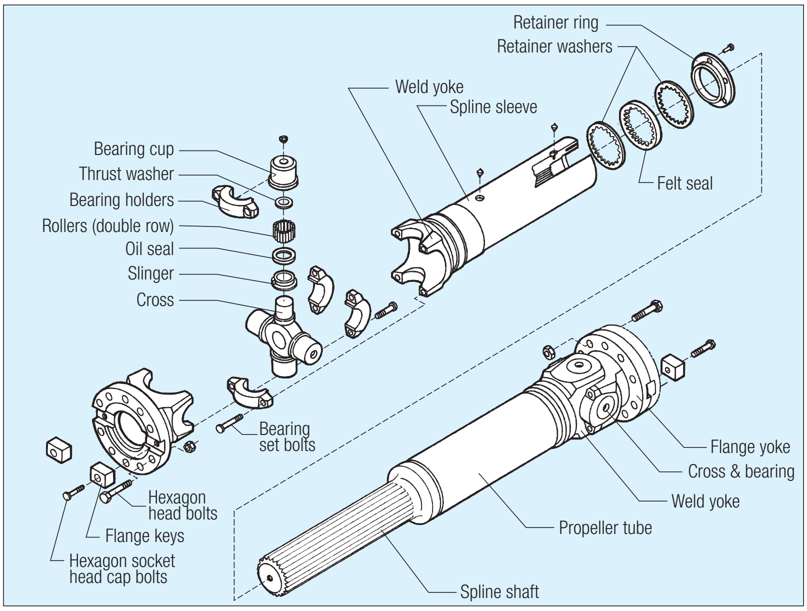
Features	Characteristics
Series for heavy load with excellent balance between performance and price	(1) Swing diameter (mm) : ϕ225 - 435
	(2) Torque T_D(kN·m) : 19.5 - 149.2
	(3) Torque T_S(kN·m) : 71.4 - 546
	(4) Maximum operating angle (°) : 15

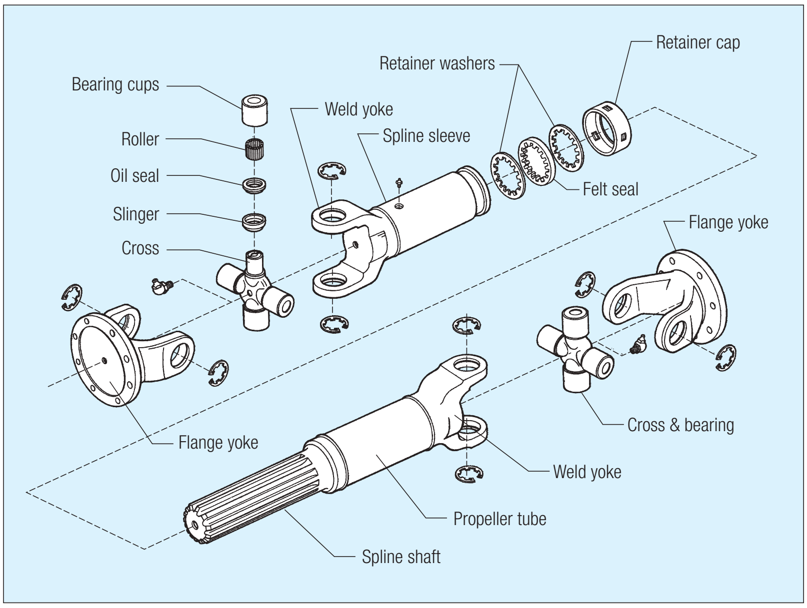
KF series

Features	Characteristics
This cost efficient series is intended for light to medium duty applications.	(1) Swing diameter (mm) : ϕ105 - 180
	(2) Torque T_D(kN·m) : 1.56 - 9.89
	(3) Torque T_S(kN·m) : 4.13 - 36.2
	(4) Maximum operating angle (°) : 18 - 30

Representative configuration







Structural features

With the cross & bearings fixed by bearing set bolts to the yokes, block type drive shafts transfer torque reliably through the key. The rollers, crosses, and bearing set bolts can be greater in size than those of the round type drive shafts, realizing high strength.

Compared with the block type, this type of drive shaft has cross & bearings of simpler construction and is more economical.

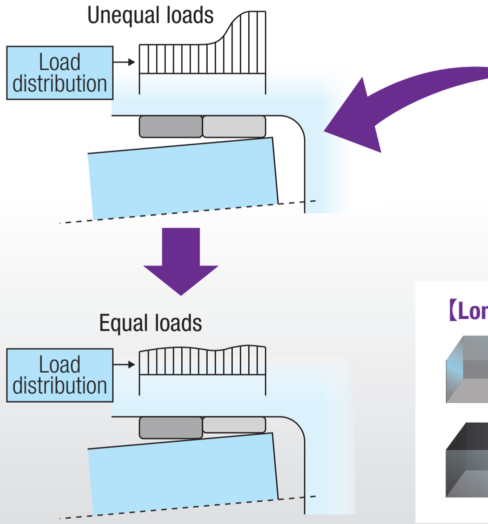
These drive shafts are connected to machines via a flange, enabling easy connection to a variety of machines.

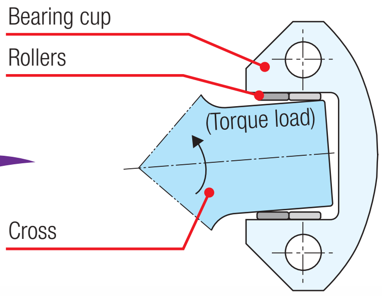
Measures to improve service life and strength

Below are optional specifications for use under severe conditions in which further strength and/or longer life are required.

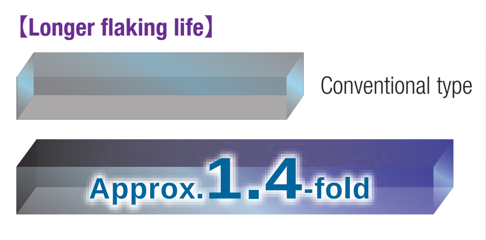
Application of different diameter rollers for cross & bearing

Because the cross is an elastic cantilever beam and the bearing has some radial clearance, the load on the cross generally becomes heavier toward to the end of the cross.
In order to improve this phenomenon, load on the roller is made uniform by designing the roller to have a minutely smaller diameter at the very close end, which would improve flaking life. (figure on the right).
It is required that the detailed investigation takes into account multitude of JTEKT records and the technology of theoretical analysis by FEM, when this would be applied.
(Rollers with different diameters can be used in a three-row structure.)





Effect of rollers different in diameter

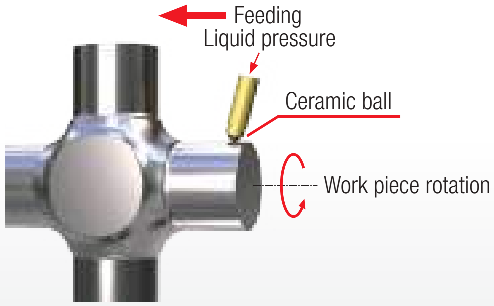


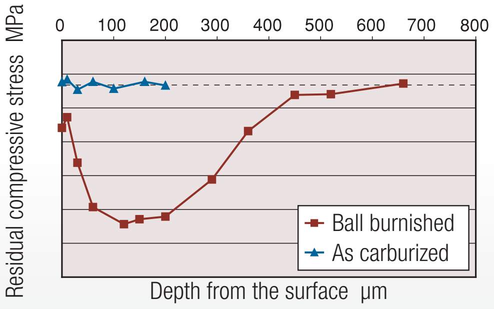
Ball burnishing on cross shaft

The flaking life can be improved by the ball burnishing on cross raceway. This process is a type of plastic working process, which is applied by rolling contact of super-hard ball backed up hydraulically on the cross raceway surface.

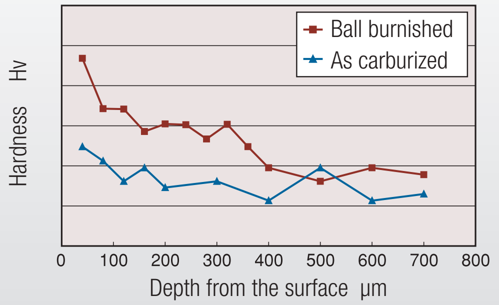
Features

(1) The hardness of the surface becomes higher than that of the carburized original material.
(2) Residual compressive stress at subsurface is larger than in the case of carburizing, and it can be applied deeply.
(3) Raceway roughness of the machined surface is improved. And no further finishing process is required after ball burnishing process.
(4) As the ball burnishing fixture can be used by attaching to lathe or other machine, there is actually no limitation in size of workpieces.





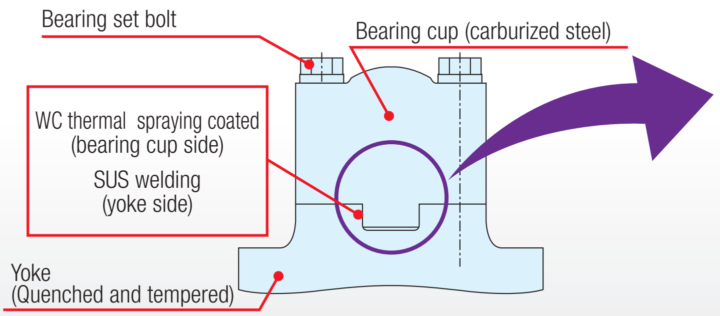
Measurement result of residual compressive stress

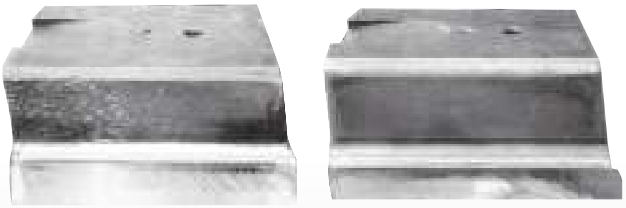


Measurement result of hardness

Thermal spraying coat of tungsten carbide (WC) on bearing cup key

To avoid corrosion on the side face of bearing cup key applying carburizing heat treatment, one possible method is to apply thermal spraying coat of tungsten carbide (WC) on these surfaces.





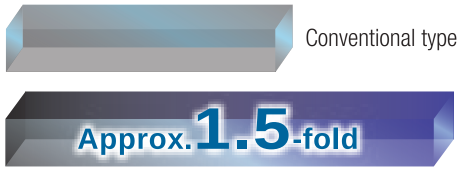
Effect of thermal spraying coat of tungsten carbide (WC)

Effects The following effects are expected in case the generation of clearance due to corrosion at the key area is restrained.

(1) The bending stress of bolt can be alleviated, which leads to the restraint of strength reduction.

(2) The heavier load on raceways at the end of the cross can be restrained, which expects longer fatigue life for cross & bearing.

【Improved corrosion resistance】

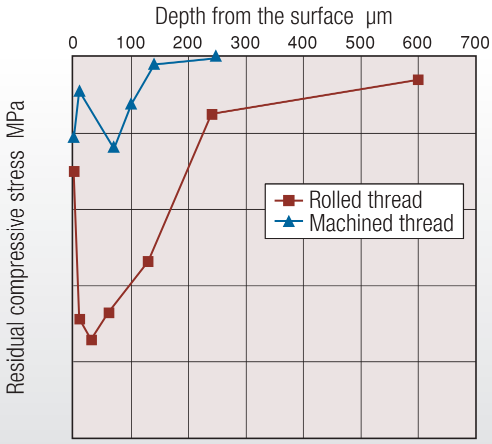


Application of form rolling to bearing set bolt

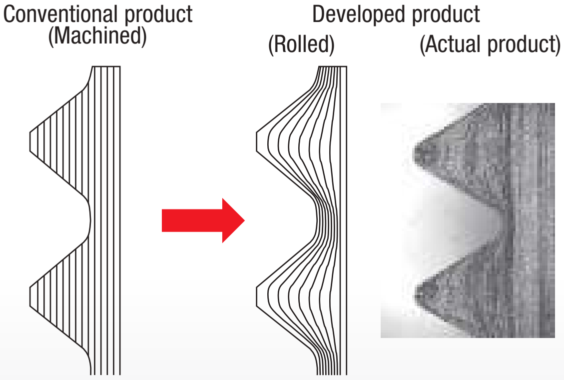
The thread of the bearing set bolt has conventionally been machined after heat treatment. However, by switching this process to form rolling, allowable fatigue stress at the bottom radii of the thread increases significantly.

Features (1) Fiber flow is formed along the shape of the thread. (figure on the right)

(2) Residual compressive stress at subsurface beneath the bottom radius of the thread increases. (figure below)



Residual compressive stress distribution of rolled thread



Fiber flow of rolled thread

【Improved fatigue strength】

Maintenance and inspection method of drive shaft

To use drive shafts safely for a long time, periodic inspection is required. Below is the periodic inspection procedure.
We accept servicing of drive shafts.
We can repair JTEKT products with a swing diameter of 500 mm or more as a guide. Please do not hesitate to contact JTEKT if you need more information.

<Examples of repair>

- Repair by grinding of raceway surfaces of cross, bearing cup
- Repair by build-up welding of yoke key grooves and oval bores
- Repair of slight wear and removal of rust

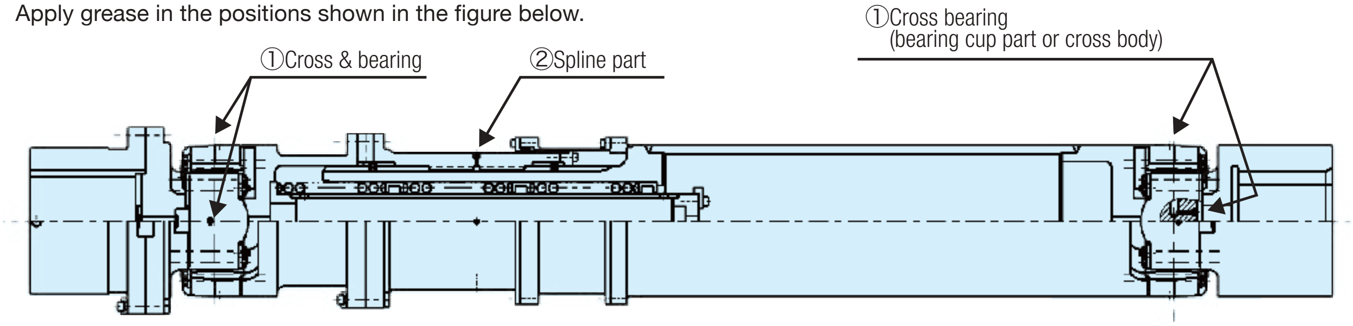
Periodic inspection

(1) Greasing

The greasing amount varies depending on the sizes of the cross & bearing and spline part.
Apply the amount of grease specified by JTEKT.

■ Greasing positions

Apply grease in the positions shown in the figure below.



■ Cycles of periodic greasing

- Hot strip mills: Once a month
- Cold strip mills: Every 3 months
- Others: Every 3 months

＊Be sure to apply grease with correct intervals and amount.
The grease to be applied should be the one specified in the drawing.
Use of insufficient or different grease may lead to early damage.

(2) Tightening torque of bolts

The tightening torque of bolts is set according to the bolt size.
If the bolts are not tightened with the proper tightening torque, it may lead to their early damage.
Refer to the tightening torque of the bolts specified in the drawing.
In addition, a dimension table of torque wrenches is provided on page 28.

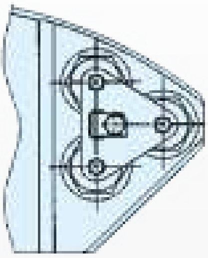
■ Periodic inspection of bolts

Conduct initial inspection of the bolts one week and one month after operation.
After that, conduct periodic inspection every six months.

Inspection of the bolts includes the following.

- Check for looseness or damage of the whirl-stop
- Check the elongation by hammering or looking

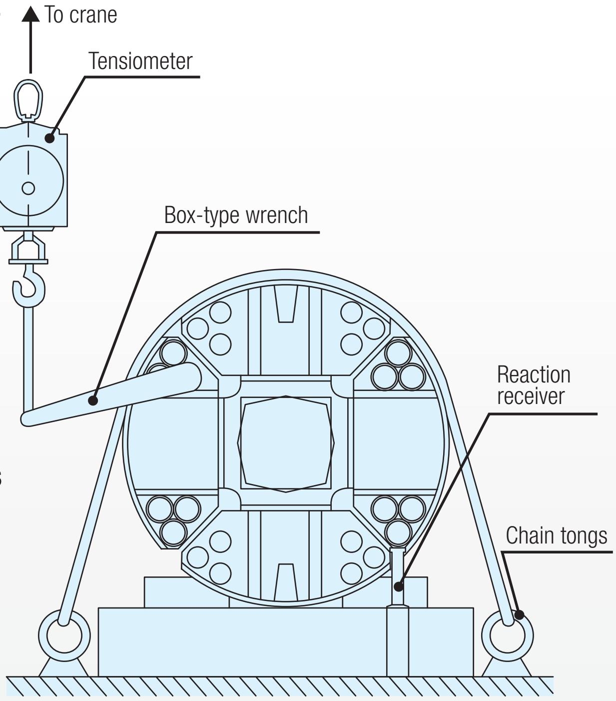
Whirl-stop with one bolt



Whirl-stop with three bolts

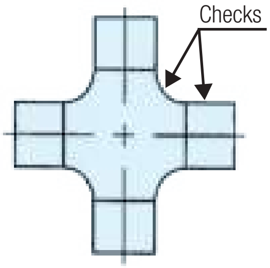
■ How to loosen/tighten the bolts of the cross & bearing

(1) As shown in the figure on the right, tighten the drive shaft with a jig such as chain tongs.
(2) Before tightening, apply a small amount of grease to the thread section and the head seat of the bolt.
(3) Tighten to the specified torque by using a wrench, tensiometer, etc.

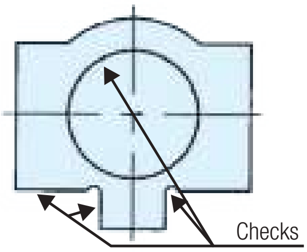


Overhaul

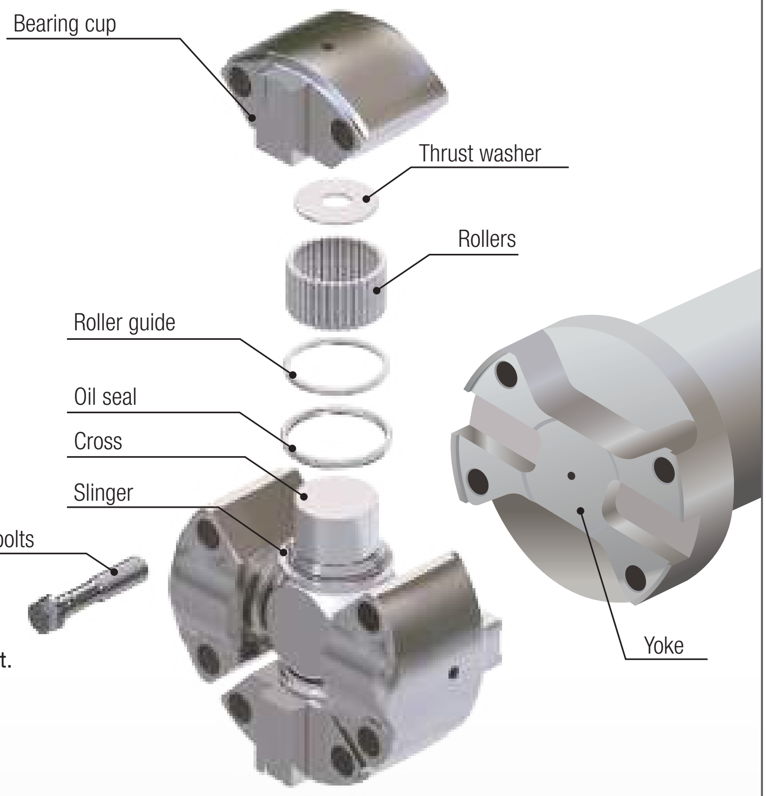
- As a rule, conduct overhaul of the major parts every year after the start of operation.
- Cross & bearing
  - Check for brinelling, wear, flaking, seizure, cracks, nicks, or rusting, etc. of the cross and bearing cup.



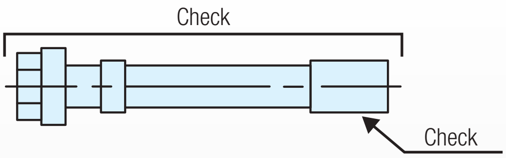
Cross



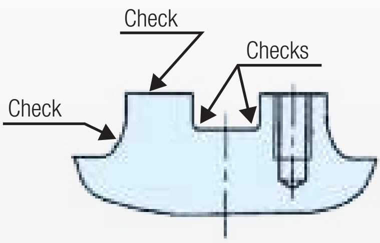
Bearing cup



- Bearing set bolt
  - Check for bending, looseness, cracks, or rusting of the bolt.



- Yoke
  - Check for cracks, nicks, or rusting, etc. of each part.
  - Especially, check the cross & bearing attaching part and the flange attaching part for signs of the above.
- Others
  - Check for wear, scuffing, or cracking, etc. of the oval bore and spline.



∗Consult with JTEKT about the inspection result.

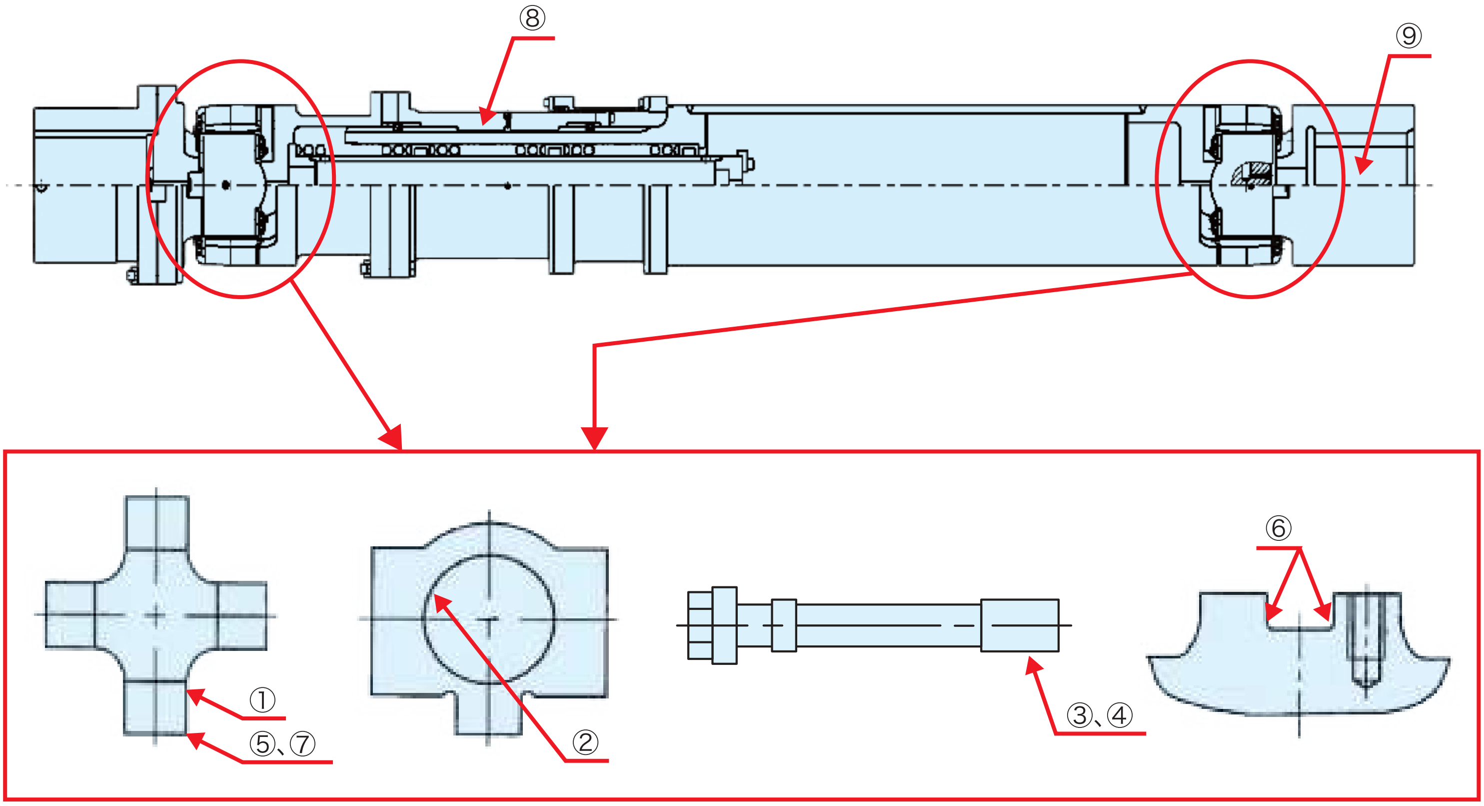
∗The next page shows some examples of failures of each part.

Management/storage

- When storing the product for a long period of time, take measures to prevent rusting.
- Before using a product stored for a long period of time, reapply grease to the cross & bearing, spline, etc.

Cases of failures

Here are some examples of failure cases of drive shaft parts.



(1) Insufficient greasing

① Flaking of cross raceway surface

<Part>
Cross

<Cause>
- Flaking occurred at the bottom of the cross due to insufficient lubrication

<Measure>
- Periodic greasing

<Treatment>
- Repair by re-grinding

② Flaking of bearing cup raceway surface

<Part>
Bearing cup

<Cause>
- Flaking occurred on the bearing cup inlet side due to insufficient lubrication

<Measure>
- Periodic greasing

<Treatment>
- Repair by re-grinding

(2) Insufficient tightening torque

③ Breakage of bolt

<Part>
Bearing set bolt

<Cause>
- Flat fracture shape because the axial force did not act on the bolt

<Measures>
- Tighten with the proper tightening torque
- Maintenance of the attaching surfaces of the cup and yoke

<Treatment>
- Replace with a new part

(3) Excessive load

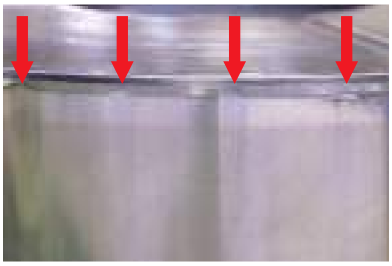
④ Breakage of bolt

<Part>
Bearing set bolt
<Cause>
- An excessive bending stress acted on the bolt

<Measures>
- Review the usage conditions
- Apply an appropriate load
- Reduce the bending stress acting on the bolt

<Treatment>
- Replace with a new part

⑤ Brinelling on raceway surface



<Part>
Cross
<Cause>
- An excessive load acted on the raceway surface

<Measures>
- Review the usage conditions
- Apply an appropriate load

<Treatment>
- Repair by re-grinding

⑥ Dent deformation of key

<Part>
Yoke key way
<Cause>
- An excessive load acted on the key way

<Measures>
- Review the usage conditions
- Apply an appropriate load

<Treatment>
- Repair by weld overlaying

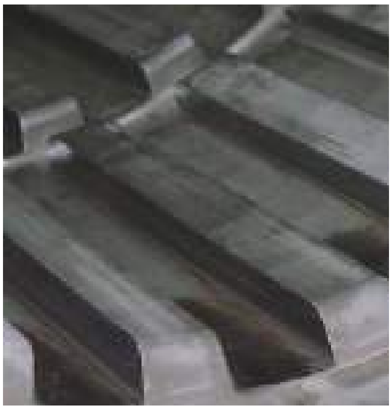
(4) Life

⑦ Flaking of raceway surface

<Part>
Cross
<Cause>
- Flaking occurred at the cross end due to long-term use

<Treatment>
- Repair by re-grinding
- Replace with a new part

⑧ Spline wear



<Part>
Spline sleeve
<Cause>
- Wear of the torque transmission surface due to long-term use

<Treatment>
- Reusable in the case of slight wear
- Replace with a new part in the case of serious wear
(Repair by weld overlaying is impossible)

⑨ Oval bore wear

<Part>
Oval bore yoke
<Causes>
- Doglegged surface pressure
- Clearance of the torque transmission surface
- Wear of the torque transmission surface due to long-term use

<Treatment>
-Repair by weld overlaying

General characteristics of universal joint (Cross-type universal joint)

Single universal joints

The driving shaft and driven shaft intermediated by a universal joint has the following relationship between their rotational angles:

$$\tan \phi_2 = \cos\theta \cdot \tan \phi_1 \quad \cdots(1)$$

where ϕ_1 : Rotational angle of driving shaft

ϕ_2 : Rotational angle of driven shaft

θ : Shaft operating angle (**Fig. 1**)

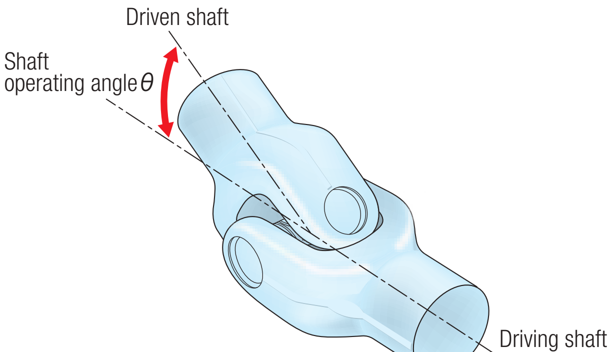


Fig. 1 Single universal joint

This means that, even if the rotational speed and torque of the driving shaft are constant, the driven shaft is subject to fluctuation in rotational speed and torque.
The speed ratio between the driving shaft and driven shaft can be obtained by differentiating equation (1) with respect to time (t), where ϕ_1 is by $\omega_1 \cdot t$ and ϕ_2 by $\omega_2 \cdot t$:

$$\frac{\omega_2}{\omega_1} = \frac{\cos\theta}{1\text{-}\sin^2\phi_1 \cdot \sin^2\theta} \quad \cdots(2)$$

where ω_1 : Rotational angular velocity of driving shaft (rad/s)

ω_2 : Rotational angular velocity of driven shaft (rad/s)

ω_2/ω_1 : Angular velocity ratio

Equation (2) can be expressed in diagram form as shown in **Fig. 2**. The maximum value and minimum value of the angular velocity ratio can be expressed as follows:

$$(\omega_2/\omega_1)\ \text{max.} = 1/\cos\theta \cdots\cdots \phi_1 = 90°$$
$$(\omega_2/\omega_1)\ \text{min.} = \cos\theta \cdots\cdots \phi_1 = 0°$$

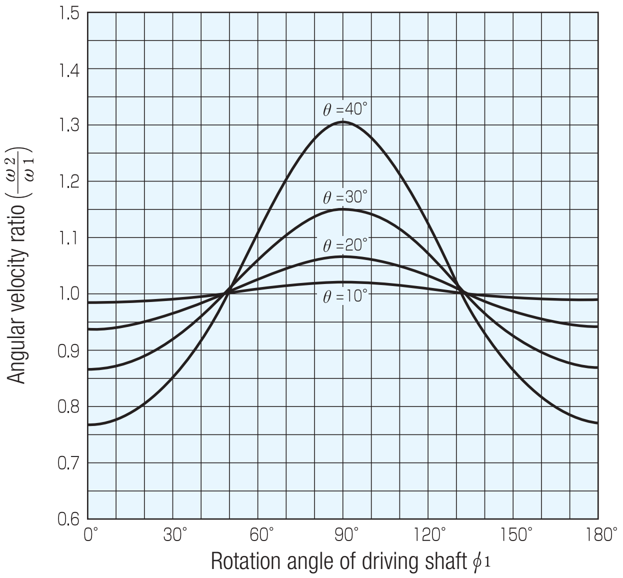

Fig. 2 Angular velocity fluctuation

The maximum fluctuation rate of angular velocity in a universal joint can be expressed by the following equation:

$$\frac{(\omega_2\,\text{max.} - \omega_2\,\text{min.})}{\omega_1} = \frac{1}{\cos\theta} - \cos\theta$$

The torque ratio between input and output can be expressed by the diagram shown in **Fig. 3**. The maximum value and minimum value can be obtained as shown below, respectively:

$$(T_2/T_1)\ \text{max.} = 1/\cos\theta \cdots\cdots \phi_1 = 0°$$
$$(T_2/T_1)\ \text{min.} = \cos\theta \cdots\cdots \phi_1 = 90°$$

where T_1 : Input torque

T_2 : Output torque

T_2/T_1: Torque ratio

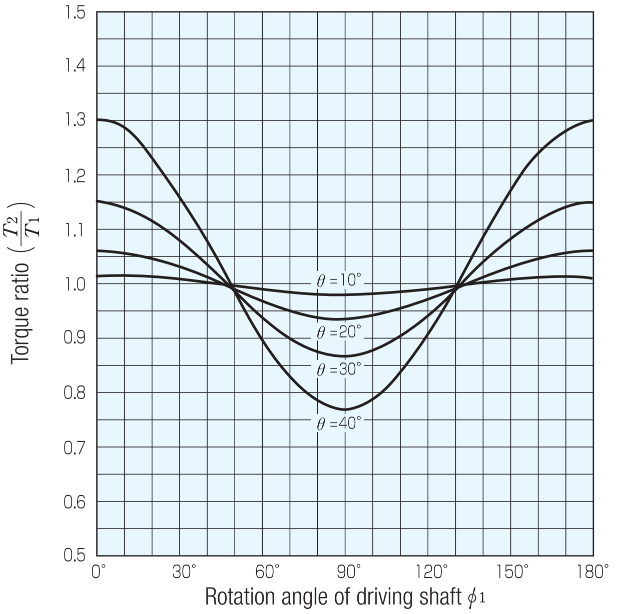

Fig. 3 Torque fluctuation

Double universal joints

Universal joints are usually installed in pairs. When assembled as shown in **Fig. 4**, that is,

(1) With equal operating angles in both joints

(2) Yokes connected to the same shaft in line

(3) Central lines of all three shafts (driving shaft, intermediate shaft, and driven shaft) in the same plane, the driven shaft rotates exactly in the same way as the driving shaft.

Therefore, they should be attached as shown in the figure on the right as far as possible.

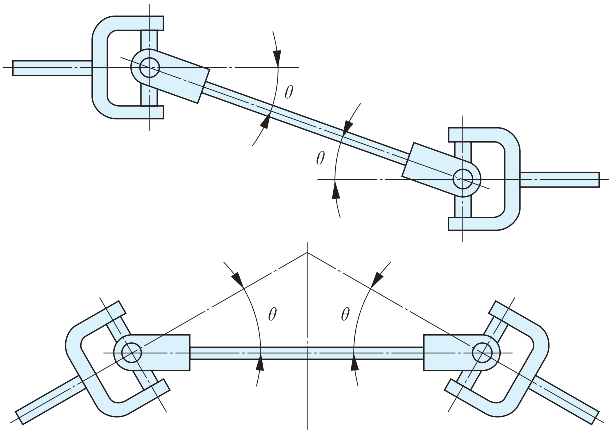

Fig. 4 Installation of double universal joints

Secondary couple

It is often necessary to consider the secondary couples imposed by universal joints operating at an angle; especially under high angle or large torque. These couples must be taken into account in designing the shafts and supporting bearings.

The secondary couples in the universal joints are in the planes of the yoke. These couples are about the intersection of the shaft axis. They impose a load on the bearings and a bending stress in the shaft connecting the joints, and they fluctuate from maximum to zero every 90° of shaft revolution. The broken lines in **Fig. 5** indicate the effect of these secondary couples on the shafts and bearings.

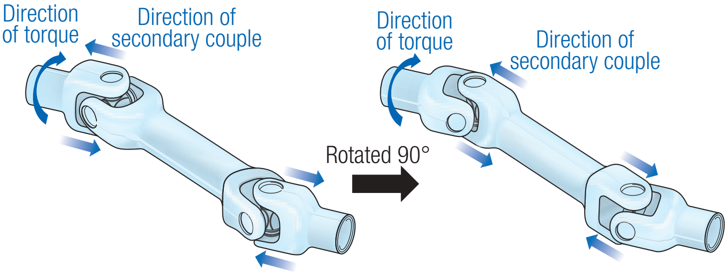
The equation for maximum secondary couple is as follows:

$$M_1 \text{ max.} = T \tan\theta \quad \text{(for driving shaft)}$$
$$M_2 \text{ max.} = T \sin\theta \quad \text{(for driven shaft)}$$

where M_1: Secondary couple on driving shaft $(\mathrm{N\cdot m})$
M_2: Secondary couple on driven shaft $(\mathrm{N\cdot m})$
T : Driving torque $(\mathrm{N\cdot m})$
θ : Shaft operating angle

The ratio of the secondary couple to the driving torque is shown in **Fig. 6**.

The secondary couple M_1 and M_2 can be obtained by multiplying M_1/T or M_2/T by the driving torque T.



(Maximum secondary couple is produced on the driving side yoke and the driven side yoke alternately at every rotation of 90°)

Fig. 5 Effect of secondary couple

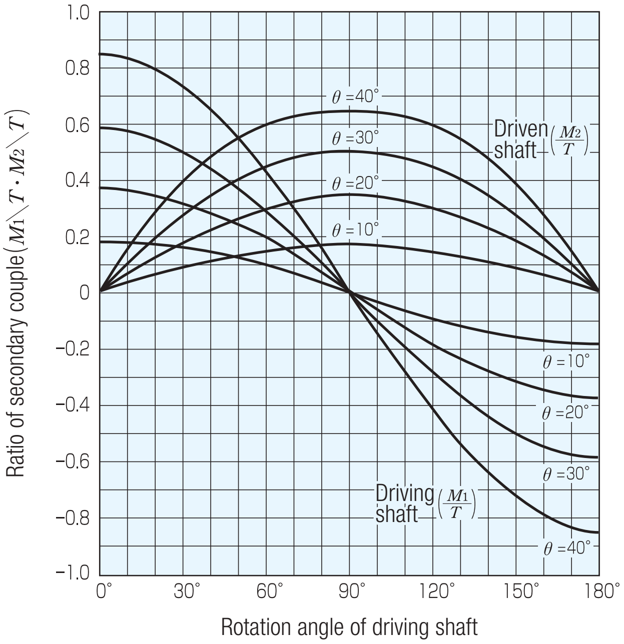


Fig. 6 Fluctuation of secondary couple to driving torque

Technical data (2)

Drive shaft selection

A drive shaft should be selected so as to satisfy the required strength, service life, operating angle and dimensions necessitated by its purpose. Especially, a drive shaft can be selected if it meets conditions of both strength and life of cross & bearings, except for special cases.

Load torque of drive shaft

To decide the size of the drive shaft, it is necessary to grasp the load torque first.

A maximum torque including an impact torque and a mean torque should be known, and it is essential for selecting an appropriate drive shaft to understand the correct maximum torque and mean torque.

Maximum torque:
Value to determine if the strength of each part is sufficient.
Mean torque:
Value necessary to calculate the service life

Mean torque

It is apparent that all kinds of machines are not operating thoroughly by their maximum torque. Therefore, if a drive shaft is selected according to a service life calculated from the maximum torque, it results in being uneconomically larger than necessary.

So, it is reasonable to set up a longer expected service life, if the application condition are severe; and shorter, if the conditions are easy.

If, for instance, a job is expressed as in the table below,

Drive stage	1	2	3·····Z
Torque (N·m)	T_1	T_2	$T_3\cdots\cdots T_Z$
Rotational speed (min^{-1})	n_1	n_2	$n_3\cdots\cdots n_Z$
Time ratio (%)	t_1	t_2	$t_3\cdots\cdots t_Z$

the cube root of mean torque (T_m) and the arithmetical mean of rotational speed (n_m) are yielded from the following equations.

$$T_m = \sqrt[3]{\frac{(T_1^3 \cdot n_1 \cdot t_1 + \cdots\cdots\cdots T_Z^3 \cdot n_Z \cdot t_Z)}{(n_1 \cdot t_1 + \cdots\cdots\cdots + n_Z \cdot t_Z)}}$$

$$n_m = \frac{(n_1 \cdot t_1 + \cdots\cdots\cdots + n_Z \cdot t_Z)}{(t_1 + \cdots\cdots\cdots + t_Z)}$$

Strength of drive shaft

A drive shaft should be selected so that the normal maximum torque shall not exceed the " T_D torque." However, it is difficult to determine the true maximum torque, and the engine capacity or motor capacity is used as the maximum torque in many cases. In consideration of the torque amplification factor (TAF) of the drive shaft and various imponderables, the safety factor (f_S) of no less than 1.5 should be considered as the most desirable.

$f_D = T_D$ /maximum torque under normal operating conditions > 1.5

The maximum torque that may occur in an emergency should be determined using " T_S torque." The safety factor (f_S) of no less than 1.5 should be considered as desirable in this case as well.

$f_S = T_S$ /breaking torque under emergency conditions > 1.5

To select a drive shaft based on a safety factor of 1.5 or less, consult JTEKT as close examination is required in consideration of previous performance records.

Life of drive shaft

There is no global standard for the method of calculating the service life of cross & bearings, and this method is based on the results of research performed by each manufacturer.

JTEKT employs the following empirical equation based on extensive experimentation (conforming to SAE).

The service life L_h is defined as the expected number of operating hours before a flaking occurs on the rolling contact surface of the bearing. The use of the bearings over the service life L_h may be practical on a low speed machine such as a rolling mill.

$$L_h = 3000\, K_m \left(\frac{T_R \cdot K_n \cdot K_\theta}{T_m} \right)^{2.907}$$

Where, L_h: Average calculated bearing life (h)
K_m: Material factor = 1 to 3
T_R: Rated torque (N·m)
T_m: Mean torque (N·m)
K_n: Speed factor = $10.2/n^{0.336}$
K_θ: Angle factor = $1.46/\theta^{0.344}$
n : Rotational speed = (min^{-1})
θ : Shaft operating angle (°)

Note) A drive shaft should be selected by considering the type of the machine, peripheral equipment, particular operating conditions, and other factors. The method outlined in this catalog is a common rough guide. It is recommended to consult JTEKT for details.

Critical number of rotation

When the rotation speed approaches the critical number of rotations of a drive shaft (bending natural frequency), the powertrain may be affected by resonance, and thus when a drive shaft is designed, the rotational flexural rigidity of the drive shaft needs to be considered.

If you need to increase the rotation speed through equipment alteration etc., please contact JTEKT.

Torque calculation from motor output

To obtain the load torque of a drive shaft, there is a method to calculate the torque from the motor output. The following is the calculation equation.

Horsepower → Torque $(\mathrm{N \cdot m})$

$$T = \frac{HP}{N} \cdot 7122 \quad (\mathrm{N \cdot m}) \quad \cdots\cdots(1)$$

However, in the case of PS (CV in French) horsepower, the following equation is applied.

$$T = \frac{PS}{N} \cdot 7024 \quad (\mathrm{N \cdot m}) \quad \cdots\cdots(2)$$

Note) Check if the horsepower specified in the drawing provided means HP horsepower or PS horsepower.

kW → Torque $(\mathrm{N \cdot m})$

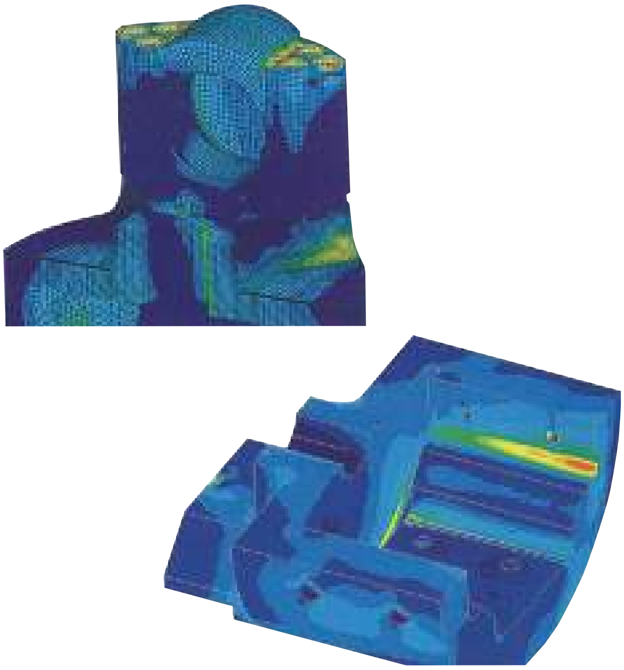
$$T = \frac{kW}{N} \cdot 9552 \quad (\mathrm{N \cdot m}) \quad \cdots\cdots(3)$$

In equations (1) to (3) above,

T : Torque $(\mathrm{N \cdot m})$
N : Rotational speed (min^{-1})
HP : Horsepower (English horsepower)
PS : Horsepower (French horse power)
kW: Kilowatt

Evaluation/analysis

JTEKT conducts FEM analysis as one of the evaluation/analysis approaches to utilize for selection of a drive shaft.



Example of FEM analysis

Balance quality of drive shaft

If a rotating drive shaft is unbalanced, it may adversely influence the equipment and ambient conditions, thus posing a problem. JTEKT designs and manufactures drive shafts to satisfy the balance quality requirements specified in JIS B 0905.

Expression of balance quality

The balance quality is expressed by the following equation:

Balance quality = $e\omega$

or

Balance quality = en /9.55

where e: Amount of specific unbalance (mm)
This amount is the quotient of the static unbalance of a rigid rotor by the rotor mass. The amount is equal to the deviation of the center of the rotor mass from the center line of the shaft.
ω : Maximum service angular velocity of the rotor (rad/s)
n : Rotational speed (min^{-1})

Balance quality grades

The JIS specifies the balance quality grades from G0.4 to G4000. Generally, the three grades described in Table 1 below are commonly used.
We apply grade G16 to high speed drive shafts unless otherwise specified.

Correction of the unbalance of drive shafts

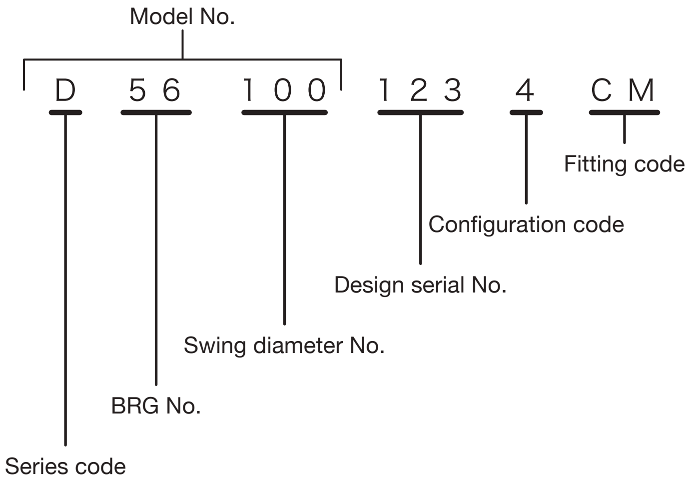
JTEKT corrects the unbalance of drive shafts to the optimal value by the two plane balancing method, using the latest balance system.
To correct the balance of a drive shaft, it is critical to correct the balance between two planes each near the two individual universal joints, instead of by the one plane balancing as used to balance car wheels.
Especially in the case of a long drive shaft, this two plane balancing method is the only way to acquire good results.

Table 1 Recommended balance quality grades (excerpt from JIS B 0905)

Balance quality grade	Upper limit value of balance quality ($e\omega$)	Recommended applicable machines
G40	40	Car wheels, wheel rims, wheel sets and drive shafts Crankshaft systems of elastically mounted high speed four stroke engines (gasoline or diesel) with six or more cylinders Crankshaft systems of the engines of automobiles, trucks and rolling stock
G16	16	Drive shafts with special requirements (propeller shafts and diesel shafts) Components of crushing machines Components of agricultural machines Components of the engines of automobiles, trucks and rolling stock (gasoline or diesel) Crankshaft systems with six or more cylinders with special requirements
G 6.3	6.3	Devices of processing plants Ship engine turbine gears (for merchant ships) Centrifugal drums Papermaking rolls and printing rolls Fans Assembled aerial gas turbine rollers Flywheels Pump impellers Components of machine tools and general industrial machines Medium or large electric armatures (of electric motors having at least 80 mm in the shaft center height) without special requirements Small electric armatures used in vibration insensitive applications and/or provided with vibration insulation (mainly mass produced models) Components of engines with special requirements

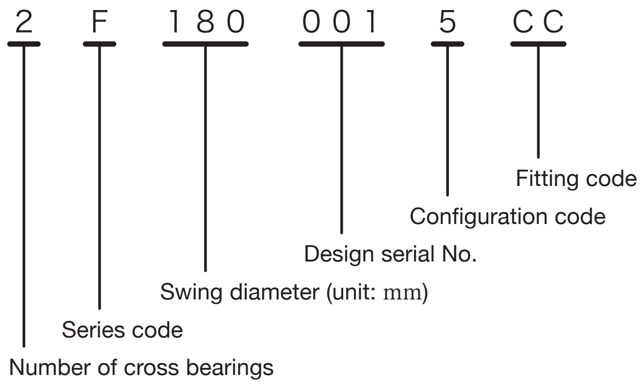
Composition of drive shaft numbers

(1) Block type

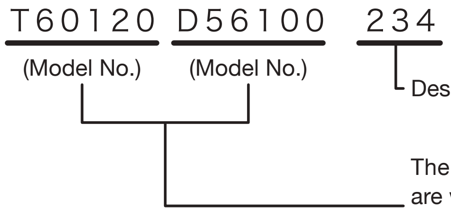


(2) Round type

① KF series

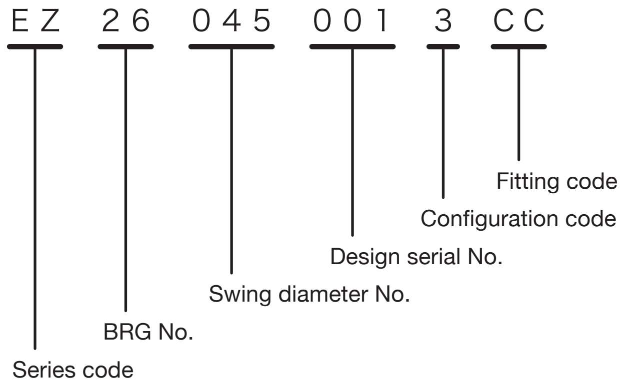


(3) Type with different model numbers on the right and left



The two model numbers are written side by side
If the rotation diameters are the same, the model numbers are written in order of T, D, and U
If the rotation diameters are different, the model number with larger rotation diameter is written first

② EZ series



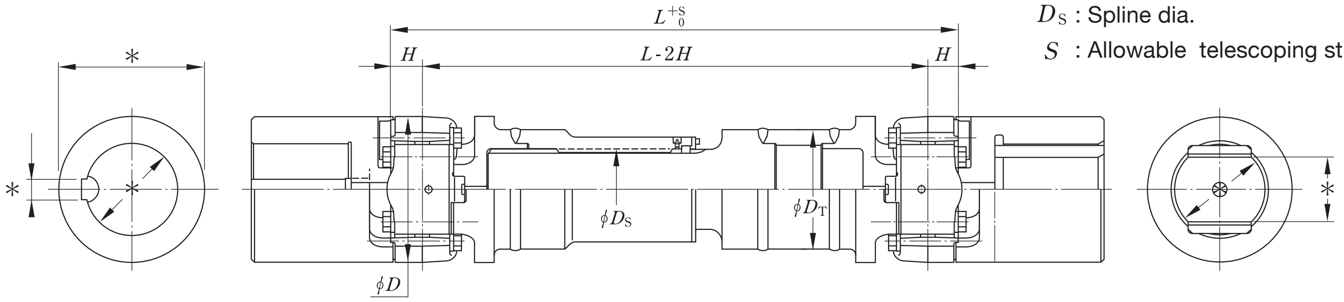
Supplementary explanation of items

- **Series code** D : D series U : U series T : T series F(Z) : KF series EZ : EZ series
- **BRG. No. :** The raceway diameters of the cross are represented in two digits in order of size (e.g.: 56, 63)
- **Swing diameter No. :** The value is swing diameter of cross & bearing /5 and is represented in three digits (e.g.: ϕ450 mm → 090, ϕ900 mm → 180)
- **Design serial No. :** Represented in three digits for each model number (001 - 999)
- **Configuration code :** Decided according to the configuration of the drive shaft
- **Fitting code :** The following shape codes are added to the left, then to the right, according to the shape of the attaching parts at both ends.
  - B : Cross & bearing
  - C : Cylindrical bore
  - F : Flange
  - M : Oval bore
  - T : Tapered bore

D series

Telescoping type (with propeller tube)

D_T : Propeller tube dia.
D_S : Spline dia.
S : Allowable telescoping stroke



Dimensions marked with an asterisk (∗) need to be determined to suit existing equipment.
Please provide the specifications of your equipment when placing an inquiry.

■ Features

This series is suitable for use under severe conditions, such as in driving rolling mill rolls.
Based on standardized cross & bearings, this series can be designed to suit a wide range of dimensions and a wide variety of fitting configurations.

■ Designs available to order

The fixed type can be designed to order, assembling components shown on the right.
For more details on these designs, consult JTEKT.

[Notes] 1) T_R refers to the rated torque used for service life calculation (refer to page 15). The material factor K_m is supposed to be 3 in this calculation.
2) T_D refers to the reference torque used as the criterion for evaluation of resistance to the maximum torque under normal operating conditions.
T_D divided by the maximum torque should preferably be greater than 1.5.
3) T_S refers to the reference torque used as the criterion for evaluation of resistance to the breaking torque under emergency conditions.
T_S divided by the breaking torque should preferably be greater than 1.5.
4) L refers to the minimum dimension when the shaft has neither propeller tube nor welded connection.
5) The parenthesized values refer to the involute spline diameter.
6) Represents the voltage used for one kit of cross & bearing.
7) The types of wrench set are as follows. For details, refer to "Torque wrench set for bolt tightening" on page 28.

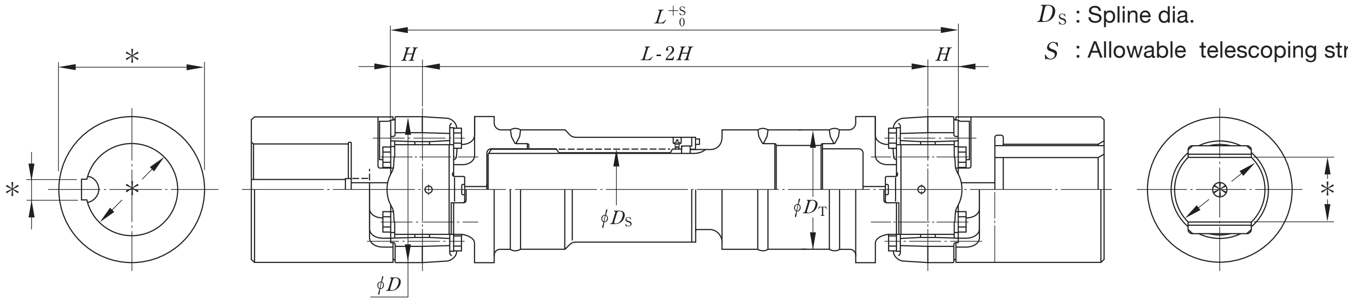
Type A: Torque wrench + Ring head	Type C: Tensiometer + Ring wrench
Type B: Torque wrench + Hexagonal bar wrench	Type D: Tensiometer + Socket wrench

[Remarks] 1) The values with * mark are reference values.
2) The T_D values in the table are the values with alternating load. For the values with pulsating load, contact JTEKT.

U series

Telescoping type (with propeller tube)

D_T : Propeller tube dia.
D_S : Spline dia.
S : Allowable telescoping stroke



Dimensions marked with an asterisk (∗) need to be determined to suit existing equipment.
Please provide the specifications of your equipment when placing an inquiry.

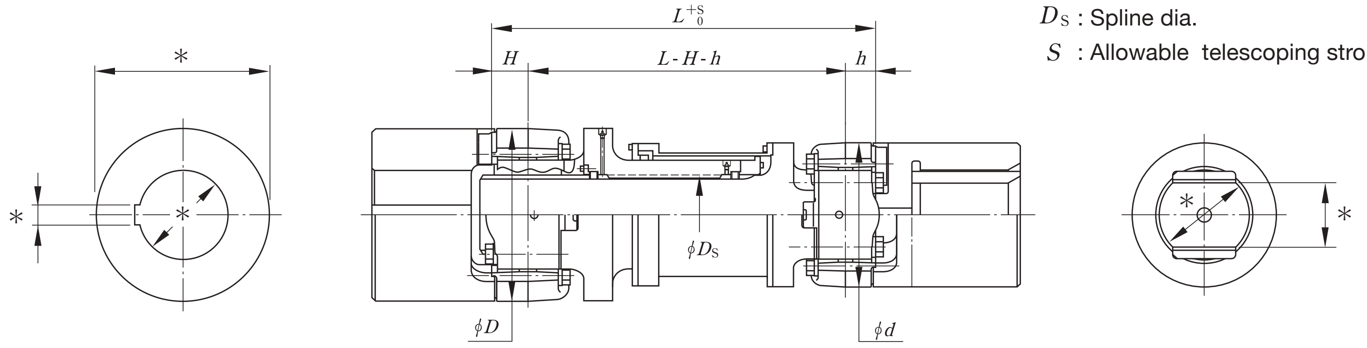
[Notes] 1) T_R refers to the rated torque used for service life calculation (refer to page 15). The material factor K_m is supposed to be 3 in this calculation.
2) T_D refers to the reference torque used as the criterion for evaluation of resistance to the maximum torque under normal operating conditions.
T_D divided by the maximum torque should preferably be greater than 1.5.
3) T_S refers to the reference torque used as the criterion for evaluation of resistance to the breaking torque under emergency conditions.
T_S divided by the breaking torque should preferably be greater than 1.5.
4) L refers to the minimum dimension when the shaft has neither propeller tube nor welded connection.
5) The value within parentheses indicates the spline diameter of the involute splines.
6) Represents the voltage used for one kit of cross & bearing.
7) The types of wrench set are as follows. For details, refer to “Torque wrench set for bolt tightening” on page 28.
Type A: Torque wrench + Ring head
Type B: Torque wrench + Hexagonal bar wrench
Type C: Tensiometer + Ring wrench
Type D: Tensiometer + Socket wrench

[Remarks] 1) The T_D values in the table are values with pulsating load.
2) If you require U series with swing diameter of ϕ285 to ϕ345, contact JTEKT.

T series



D_S : Spline dia.
S : Allowable telescoping stroke

Dimensions marked with an asterisk (∗) need to be determined to suit existing equipment.
Please provide the specifications of your equipment when placing an inquiry.

■ Features

The T Series is intended for such applications where telescoping function is required in a small space. Because one of the cross & bearings needs to be hollow to enable the required stroke, this series is applicable in such cases where the swing diameter has a given allowance on either the driving side or driven side.

[Notes]
1) T_R refers to the rated torque used for service life calculation (refer to page 15). The material factor K_m is supposed to be 1 for the drive shafts whose swing diameter is 180 mm or less, and to be 3 for those whose swing diameter is between 225 mm and 435 mm in this calculation.
2) T_D refers to the reference torque used as the criterion for evaluation of resistance to the maximum torque under normal operating conditions. T_D divided by the maximum torque should preferably be greater than 1.5.
3) T_S refers to the reference torque used as the criterion for evaluation of resistance to the breaking torque under emergency conditions. T_S divided by the breaking torque should preferably be greater than 1.5.
4) L refers to the minimum dimension when the shaft has neither propeller tube nor welded connection.

[Remarks] 1) The T_D values in the table are the values with alternating load. For the values with pulsating load, contact JTEKT.

For the flange dimensions (PCD, C, F, G, K and t) that suit the individual flange outside diameter (D_F) and for the flange bolt hole details, refer to KF/EZ series flange coupling with cylindrical bore on page 27.

■ Features

The KF/EZ Series products have the following features depending on the swing diameter.

● Swing diameter: 180 mm or less
The products are suitable for applications where the maximum operating angle is between 18° to 30°. They are suited to light load applications.These products are compatible with a wide variety of equipment. In addition they are economical, with the yokes being integrated.

● Swing diameter: 225 to 435 mm
The products are suitable for applications where the maximum operating angle is no more than 15°. They are suited to medium load applications.
Their yokes can be disassembled, so that their cross bearings can be replaced easily.

■ Designs available to order

When installation space is limited or when a stroke needs to be long, this series can be designed to order. Assembling components are shown below.
For more details on these designs, consult JTEKT.

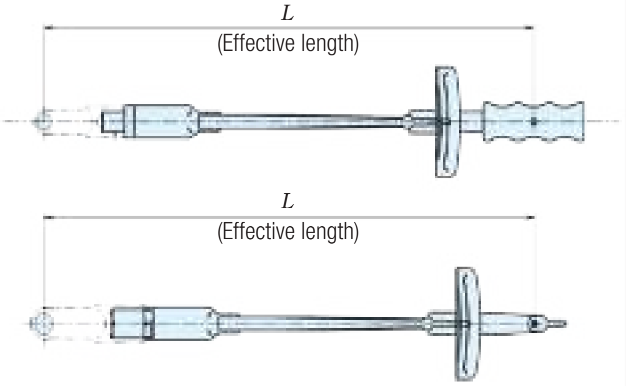
[Notes]
1) The keyway dimensions (S, T and R) shall be determined in conformity with JIS B 1301.
2) The dimensions l and m are determined according to customer specifications. (When not specified, l is recommended to be d_1 multiplied by between 1.2 and 1.5 and m to be d_1 multiplied by about 0.02.)
3) The upper line value in each cell is a dimension for the drive shaft end and the lower line value is a dimension for the cylindrical bore flange coupling end.
4) The d_1 max. dimensions are approximately D_1 divided by 1.6.

Torque wrench set for bolt tightening

JTEKT provides torque wrench sets suitable for bolt tightening of the drive shaft.
The following are torque wrenches and related tools and their specifications. For details, contact JTEKT.

Torque wrench



No.	*L* (mm)	Scale range (same on the right and left) (N·m)	Minimum scale (N·m)

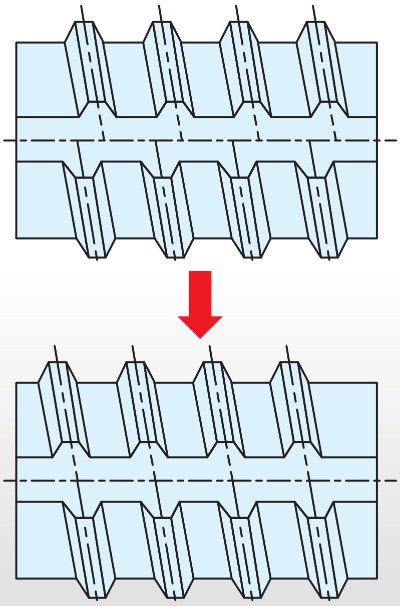
Product introduction

Drive shaft with roll phase adjustment device for bar and rod mill

Applications



Used to adjust the rotation direction phase of the upper and lower rolling mill rolls arbitrarily when forming a continuous thread shape in manufacturing of bar and rod steel for building material (screw reinforcing bar) in bar and rod mills.

Reasons for increase of needs of screw reinforcing bar

(1) To simplify operations, the connection method of bar steel was increasingly changed from previous "welding method" to "screw connection method."

(2) By forming continuous convex in the periphery of bar steel, adhesion with concrete is increased.

Necessity of phase adjustment of rotation direction of rolls

For roll forming of continuous convex screw thread on the surface of bar steel, the rotation direction phase of the upper and lower rolls with concavity spiral groove formed should be adjusted to an arbitrary position.

Features

(1) The rotation phase can be adjusted almost steplessly, which improves the accuracy of products.

(2) The phase can be adjusted in a short time, which improves the efficiency of the work.

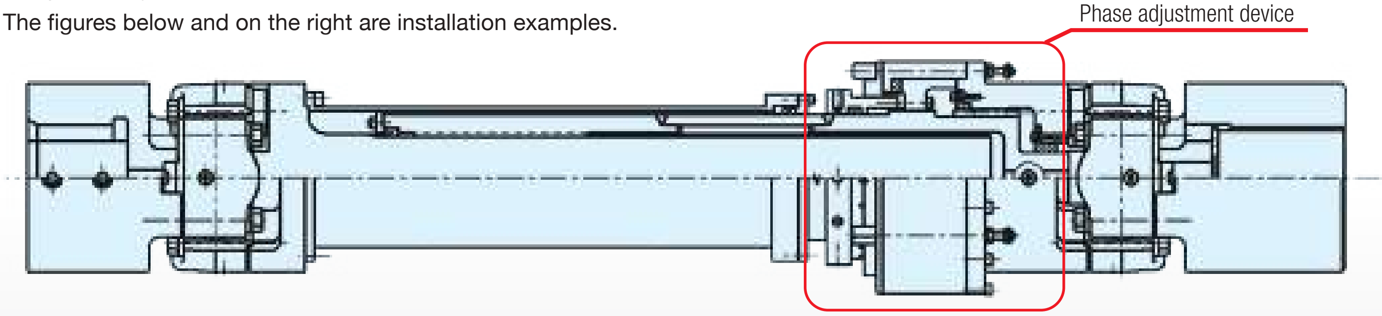
(3) With its unique configuration, the space can be saved in the directions of diameter and shaft.

(4) The lineup of equipment has been enriched to suit most of the bar steel sizes.

(5) On-line work can be conducted without removing the drive shaft.

Installation examples

The phase adjustment device can be attached to both horizontal stand and vertical stand.
The figures below and on the right are installation examples.



For vertical stand

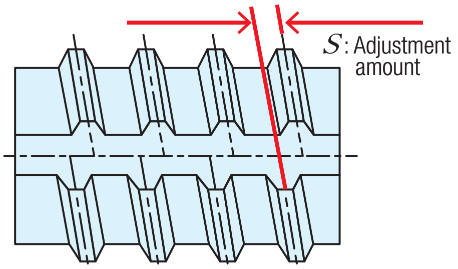
Work procedure

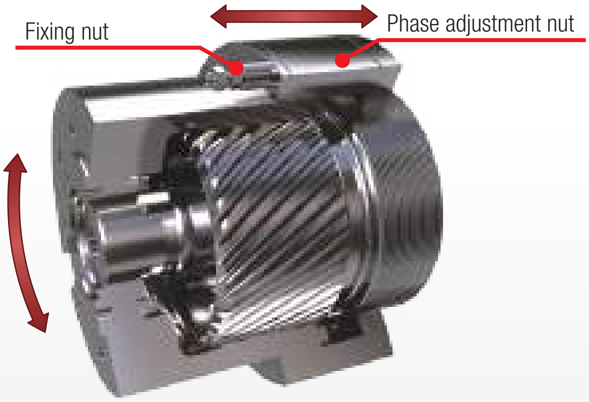
(1) Phase adjustment work should be conducted with the rolls of the rolling mill inserted to the drive shaft. First, measure the adjustment amount.

(2) Decide the number of adjustment scales from the following equation.

$$N = \frac{18 \cdot P \cdot S}{D \cdot L \cdot \tan\theta}$$

N : Number of adjustment scales
P : Helical spline PCD*
S : Adjustment amount (mm) (Measure the dimension in the figure on the right)
D : Roll diameter (mm) (customer dimension)
L : Adjustment nut pitch*
θ : Helical spline helix angle*
For items with *, contact JTEKT.





(3) Loosen the fixing nuts in three positions so that the adjustment nut should be able to rotate.

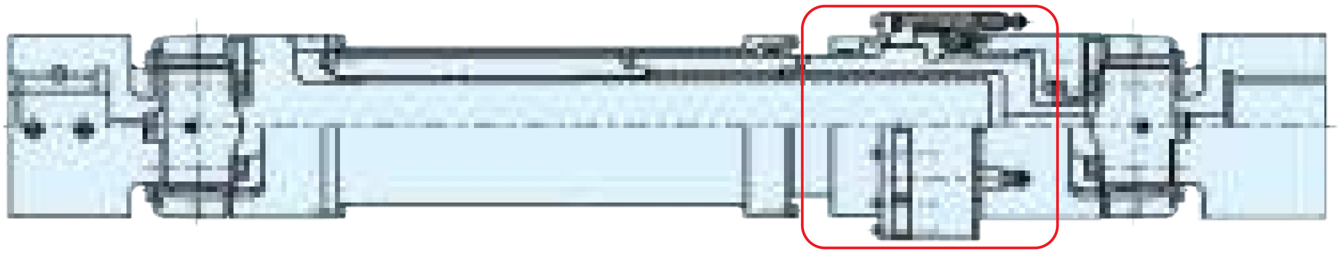
(4) Proceed with adjustment by rotating the phase adjustment nut. When the adjustment nut is rotated, the helical spline slides. With sliding of the helical spline, the rolls rotate slightly. Adjust them to an arbitrary phase.

(5) When the work is complete, tighten the fixing nuts for whirl-stop so that the adjustment unit should not move. It is fixed to this phase.

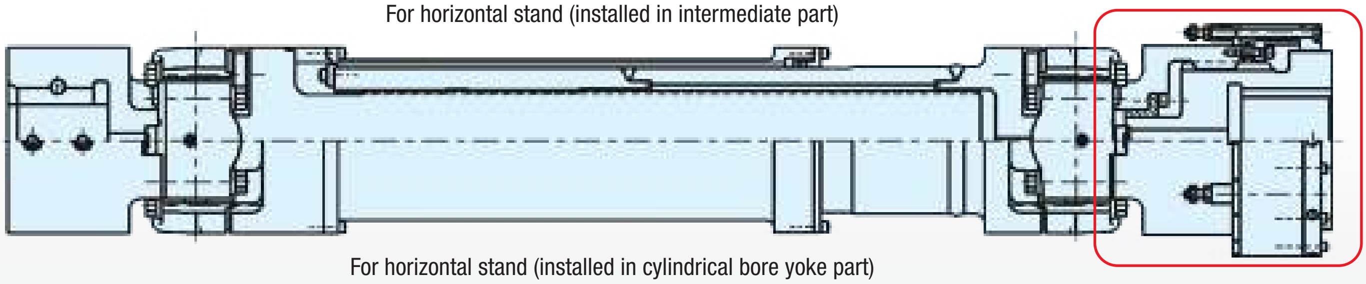
For design of phase adjustment device

Provide JTEKT with the following information for design of the optimal phase adjustment device.
Provide them along with the selection sheet of the drive shaft.

- Stand status (horizontal stand or vertical stand)
- Roll rotation direction (seen from the pinion stand)
- Roll diameter (disposal diameter)
- Pinion PCD
- Pitch in the case of screw reinforcing bar and intercalary dimension in the case of bar steel with different diameters



For horizontal stand (installed in intermediate part)



For horizontal stand (installed in cylindrical bore yoke part)

Product introduction

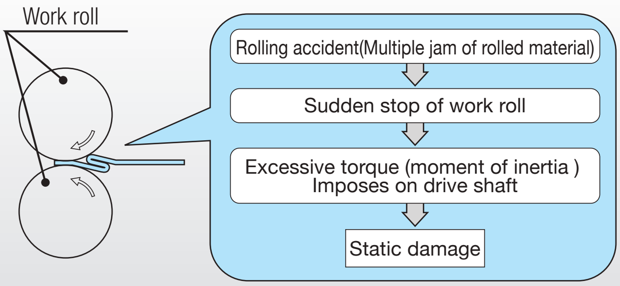
Hyper coupling (1)

Applications

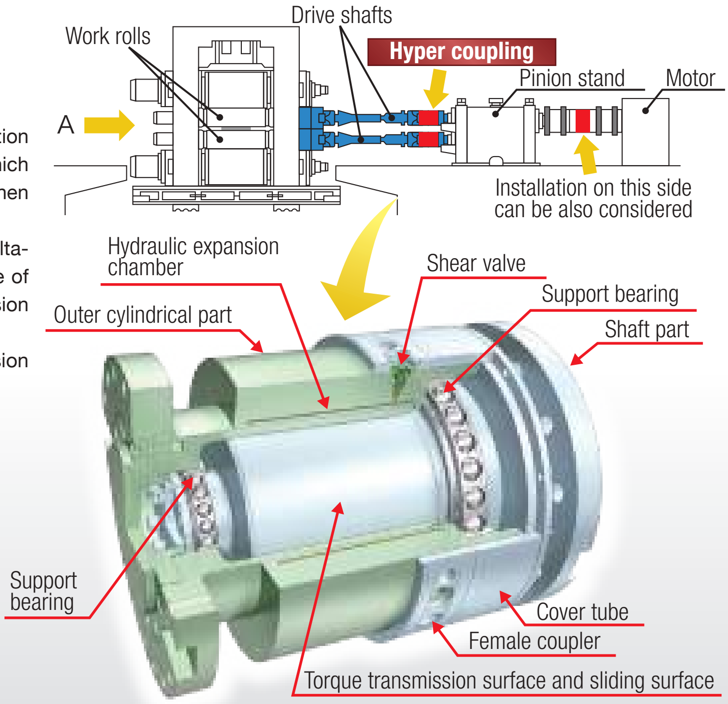
Used to protect peripheral devices of rolling mills against excessive torque.

Structure and working principle

The hydraulic expansion type torque limiter transmits torque by the friction between the shaft components and the welded coupling assemble, which is generated by the bore shrinkage of the welded coupling assemble when oil is filled and pressurized in the hydraulic expansion chamber.
The torque can be set in proportion to hydraulic pressure, which is simultaneously released by the decompression of oil, thanks to the breakage of the shear valve coming concurrently with slipping of torque transmission surface, if the excessive torque beyond set value is generated.
The following illustration shows an example of the hydraulic expansion type torque limiter applied to a rolling mill.



View A (Example of abnormal rolling)



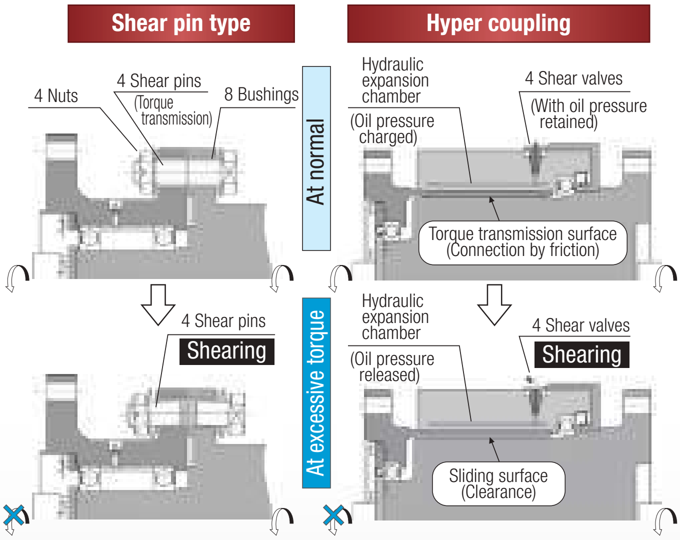
Installation position and structure of hyper coupling

Comparison of Conventional Product

The shear pin type torque limiter has been used as the implement to release torque, however, the maintenance of surrounding parts of the shear pin is required in case the shear pin is broken, which leads to a lot of time consuming for replacement. Furthermore, the pin needs to be periodically replaced in the overhaul in order to prevent the accumulated metal fatigue of the pin. Compared with the share pin type torque limiter, the hydraulic expansion type torque limiter requires only share valve replacement for repair. Since it is not required to replace the shear valves during periodical inspection, it will improve the overhaul time.

		Shear pin type	Hyper coupling
At the time of recovery	Replacement part	◆Shear pin : 4 pieces ◆Nut : 4 pieces ◆Bushe : 8 pieces	◆Shear valves : 4 pieces
	Ratio of required man-hours for part replacement	1	1/4
At the regular inspection time		Periodic replacement of shear pins is required due to accumulated fatigue	Periodic replacement of shear valves is not required

Merits of hyper coupling



Features

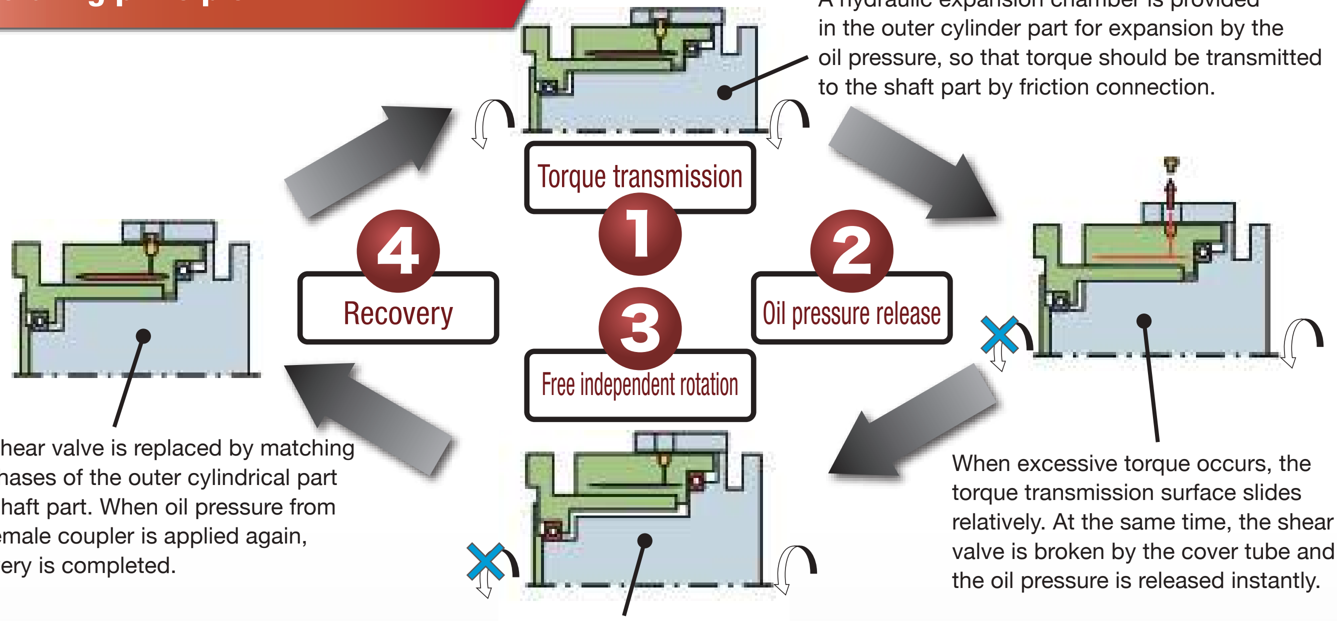
(1) The recovery time after operation (oil pressure release) is significantly shortened.

(2) High operation accuracy.
  - The operation torque accuracy is high. The variation of the operation torque is within ±10 %.
  - The operation torque is validated by using a large-sized torsion testing machine to improve reliability.

(3) The operation torque can be easily set.

(4) High durability performance.
  - A high degree of free independen rotation performance after the release of the oil pressure is secured by utilizing our know-how as a bearing manufacturer.
  - Special surface treatment is applied to the operating surface to improve durability.
  - The oil pressure release-performance is improved by establishing an analysis method of the oil pressure release time.

Operating principle



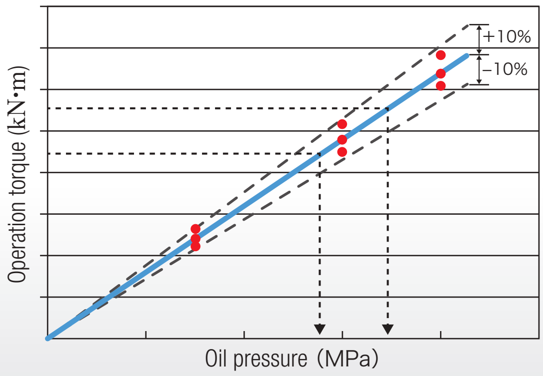
A hydraulic expansion chamber is provided in the outer cylinder part for expansion by the oil pressure, so that torque should be transmitted to the shaft part by friction connection.

When excessive torque occurs, the torque transmission surface slides relatively. At the same time, the shear valve is broken by the cover tube and the oil pressure is released instantly.

The outer cylindrical part and the shaft part are free to rotate independently and smoothly on the bearings that support both ends of the torque transmission surface.

The shear valve is replaced by matching the phases of the outer cylindrical part and shaft part. When oil pressure from the female coupler is applied again, recovery is completed.

Operation torque



Oil pressure-operation torque diagram (image)

The setting of operation torque can be changed easily by adjusting the oil pressure value.

Before shipping, a large-sized torsion testing machine is used with the actual machine to calculate the relationship between each oil pressure and operation torque.
We set the oil pressure value for the requested operation torque.
The accuracy of the operation torque with each oil pressure value is high: within ±10 %.

Large-sized torsion testing machine

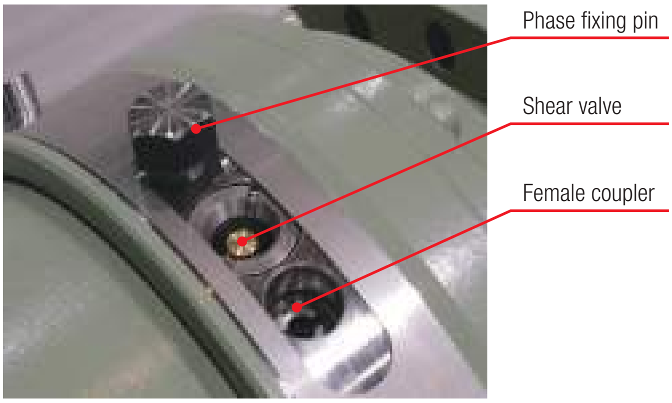
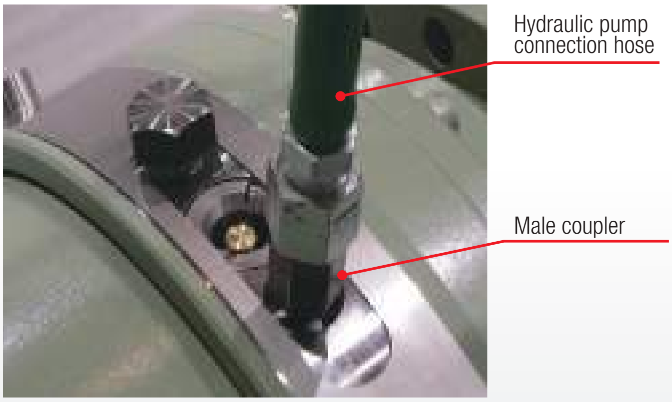
Recovery method after operation

(1) After the drive system (drive shaft) is stopped completely, clean its surroundings.

(2) Match the phases of the outer cylinder part and shaft part and fix the cover tube and the outer cylinder part by using the phase fixing pin.
Remove the shear valve that has been cut off and replace with a new shear valve after cleaning.
(figure on the upper right)



(3) Insert the connection hose of the hydraulic pump with a male coupler to the female coupler and fill the hydraulic expansion chamber with oil and pressurize to the set pressure. (figure on the middle right)

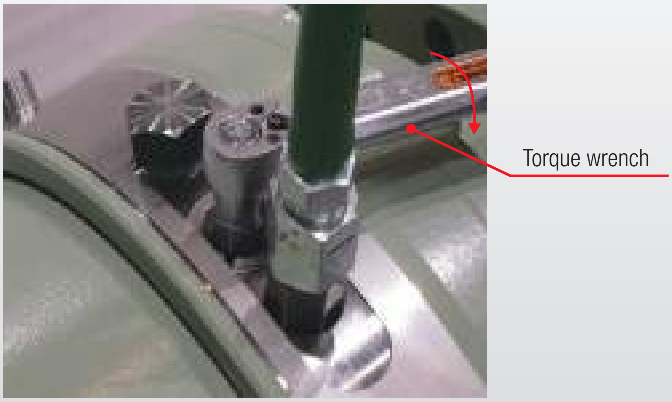


(4) The oil pressure is retained by tightening the shear valve with specified torque. (figure on the lower right)

(5) Check for oil leakage of the shear valve.

(6) After removing the residual pressure of the hydraulic pump, remove the connection hose. The recovery is completed.

For details, refer to the operation manual attached to the product to conduct work.



Examples of main tools (attached)

(1) Hydraulic pump
Used to fill the hydraulic expansion chamber with oil and pressurize.

(2) Torque wrench
Used to attach and remove the shear valve assembly, coupler assembly, and phase fixing pin.

(3) Phase fixing pin
Used for whirl-stop at the time of recovery of the hyper coupling.

(4) Male coupler
Attached to the end of the hose attached to the hydraulic pump.
It is inserted to the female coupler of the hyper coupling to pressurize and depressurize the hydraulic expansion chamber.

80×40	80		40			2.50 ~3.00	—	80				2.00 ~2.50	25.0	15.4		330~380
90×45	90	0 −0.087	45				—	90	−0.037 −0.124	0 −0.087	±0.0435		28.0	17.4		380~440
100×50	100		50				—	100					31.0	19.5		440~500

[Notes] 1) Dimension l shall be selected among the following within the range given in Table.
The dimensional tolerance on l shall be generally h12 in JIS B0401.
6 , 8 , 10 , 12 , 14 , 16 , 18 , 20 , 22 , 25 , 28 , 32 , 36 , 40 , 45 , 50 , 56 , 63 , 70 , 80 , 90 , 100 , 110 , 125 , 140 , 160 , 180 , 200 , 220 , 250 , 280 , 320 , 360 , 400
2) The applicable shaft diameter is appropriate to the torque corresponding to the strength of the key.

[Remark] The nominal sizes given in parentheses should be avoided from use, as possible.

[Reference] Where the key of the smaller tolerance than that specified in this standard is needed, the tolerance on width b of the key shall be h7. In this case, the tolerance on height h shall be h7 for the key 7× 7 or less in nominal size and h11 for the key of 8 × 7 or more.

Cylindrical Roller Bearings for Multi-roll Mill Backup Rolls

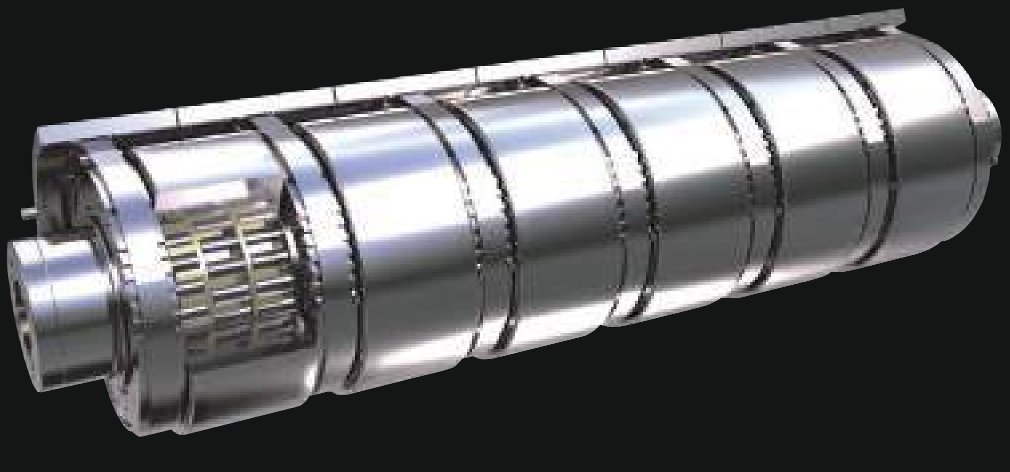
CAT.NO.BA015EN-0MY

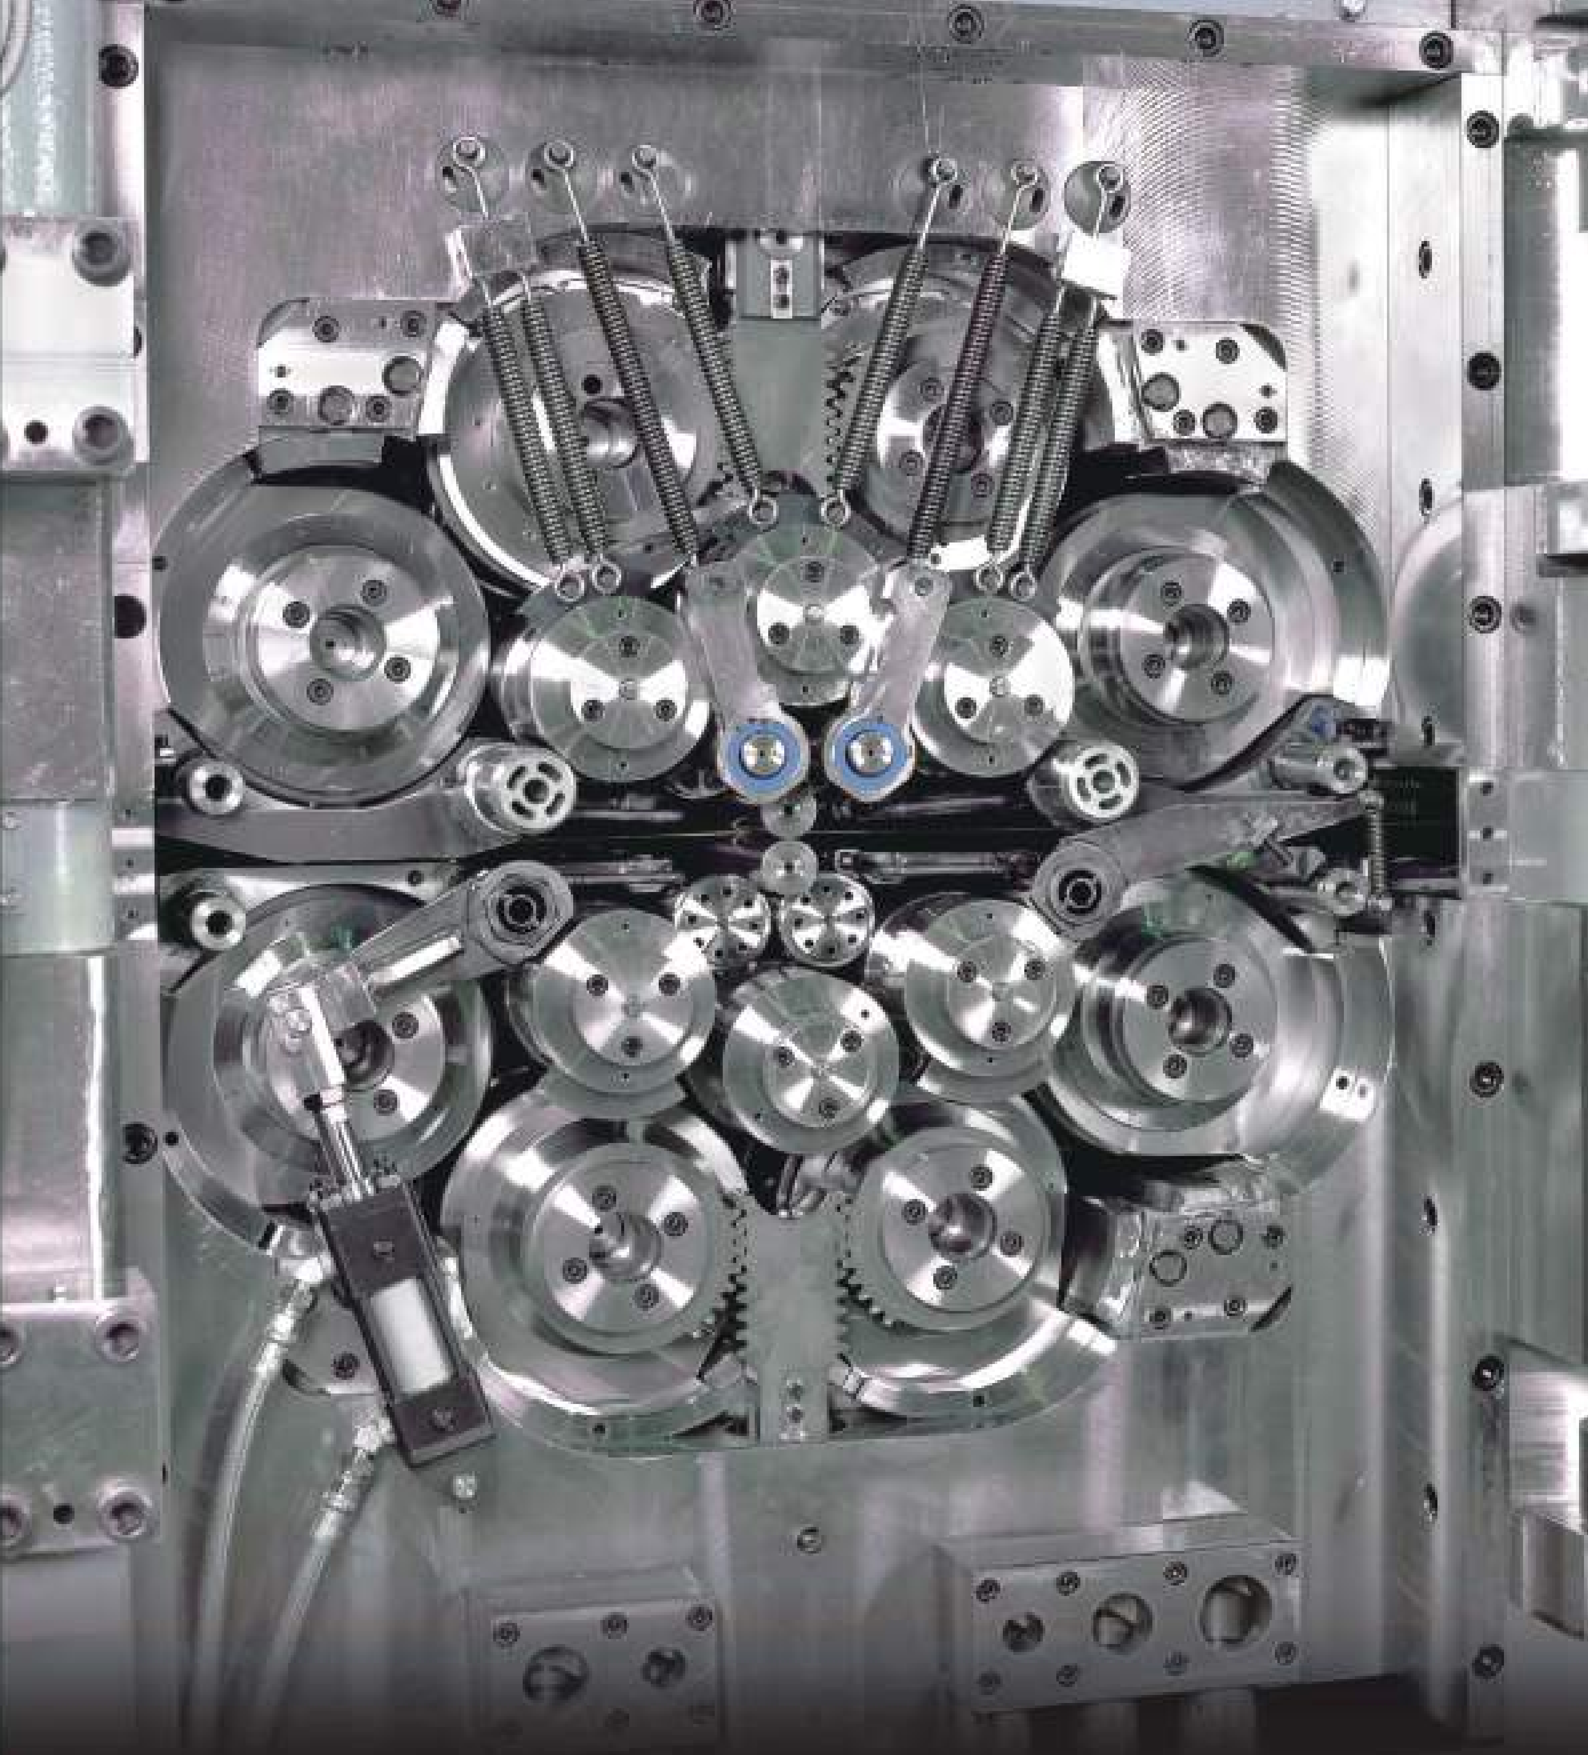
JTEKT started producing cylindrical roller bearings for backup rolls for Sendzimir mills in the 1950s and has continued to provide superior products for customers around the world.

As regards to the backup rolls assembling products, which is the Key component of the Sendzimir mill, we concluded a production agreement for licensing with SENDZIMIR JAPAN, LTD. in 1970 and now supply over 100 products for Sendzimir mills around the world.

We support our customer's operations stability not only with cylindrical roller bearings for backup rolls, but with cylindrical roller thrust bearings for work rolls , bearing-regrinding jigs, measurement of the bearing's section height with equipment developed at JTEKT and our technical know-how and experience.

JTEKT has a long history of providing high quality products and the experience to offer products with high durability and reliability.





Multi-roll mills enable our customers to utilize extremely small diameter work rolls with a choice of 12 or 20 rolls. Thereby, we are now capable of rolling hard materials such as stainless steel sheets and electrical steel sheets as well as rolling ultrathin copper. Cylindrical roller bearings for backup rolls play a significant role in obtaining this high level of efficiency.

Photo by: SENDZIMIR JAPAN, LTD.

Cylindrical roller bearings for multi-roll mill backup rolls

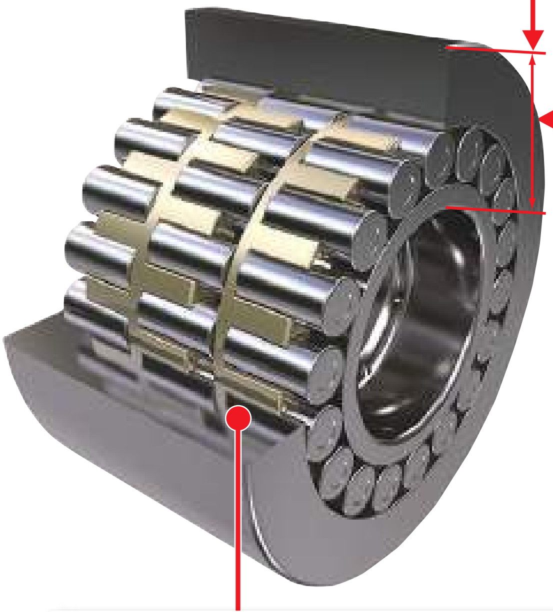
JTEKT has provided Cylindrical roller bearings for backup rolls with high durability and precision, contributing to the utmost performance in multi-roll mills.

Required performance and issues

- 🟪 **Seal structure that maintains a favorable lubricated state**
- 🟩 **Longer inner ring rolling fatigue service life**
- 🟥 **Improving outer ring durability**
- 🟦 **Improving outer ring rotational accuracy**
- 🟧 **Improving ease of outer ring regrinding work (P15-16)**

Bearing configuration and features

The bearings which are used for multi-roll mill backup rolls are attached to the rolls on 1 shaft and the bearings outer diameter are fit closely to the intermediate roll which rotates while loading the rolling component force. Therefore, the outer ring must be fabricated having sufficient rigidity and fatigue strength as well as high precision. At JTEKT, we assemble the bearings in a specially controlled clean working environment.



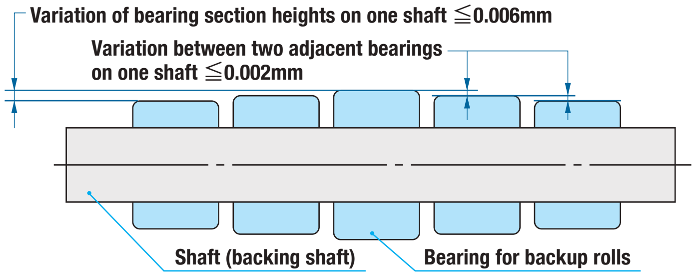
- **The outer surface of the bearing is manufactured through crowning, which accounts for the contact stress distribution to prevent damage to the intermediate roll due to edge load.**

Uncrowned outside surface **Crowned outside surface**

Typical contact stress distribution of the outer-ring's outside surface

(Refer to P16 for the dimensions of the outer ring crowning)

- **By ensuring that high precision in both the variation of the bearing's section heights and high rotation accuracy is achived for optimum distribution of the bearing loads and supporting the development in rolling precision and the quality of the coils.**



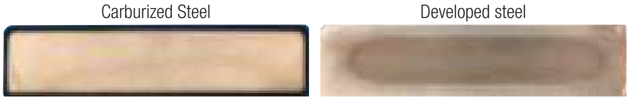
Cored hardening

Surface-hardened layer improved approximately 3-fold

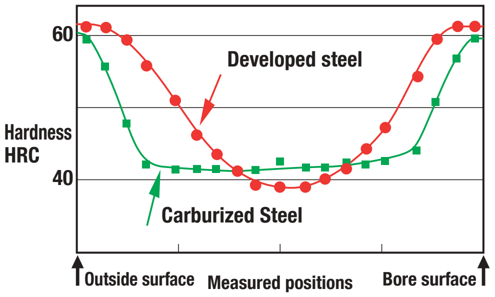
- **Outer ring is fabricated by JTEKT original developed steel and cored hardening.**

※**Cored hardening is applied to bearings of over 130mm inner diameter.**

【Macroscopic structure】



【Surface-hardened layer】



Typical hardness distribution of cored hardening outer ring

Long life, highly corrosion-resistant JHS is driving innovations in steel production equipment.

Iron manufacturing and rolling mill lines must operate continuously while maintaining high reliability in severe production environments. Answering these needs through the realization of epoch-making long-life and high corrosion resistance is JTEKT Hyper Strong (JHS). By adopting newly developed materials and processes for bearing steel, seal materials and other components, we have realized a 2-to-4-fold increase in bearing service life compared to previously used bearings. Continuing on from JHS520 for rolling mill roll necks and JHS210 for Sendzimir rolling mill backup rolls, we are steadily expanding the bearing series according to each application. The JHS bearing series offers total support for achieving maximum performance and durability in the ever-evolving field of steel equipment. Please keep your expectations high. We won't let you down.

🟪 Seal structure that maintains a favorable lubricated state 🟩 Longer inner ring rolling fatigue service life 🟥 Improving outer ring durability 🟦 Improving outer ring rotational accuracy

Bearing for oil mist lubrication

Advantages

- **Improving bearing service life (2-fold/4-fold compared to conventional types)**
- **High sealing performance**
- **Oil seal's Space-saving size for simple installation/ removal**

【Service life】

Conventional type

Approx.2-fold JHS210 (standard specification)

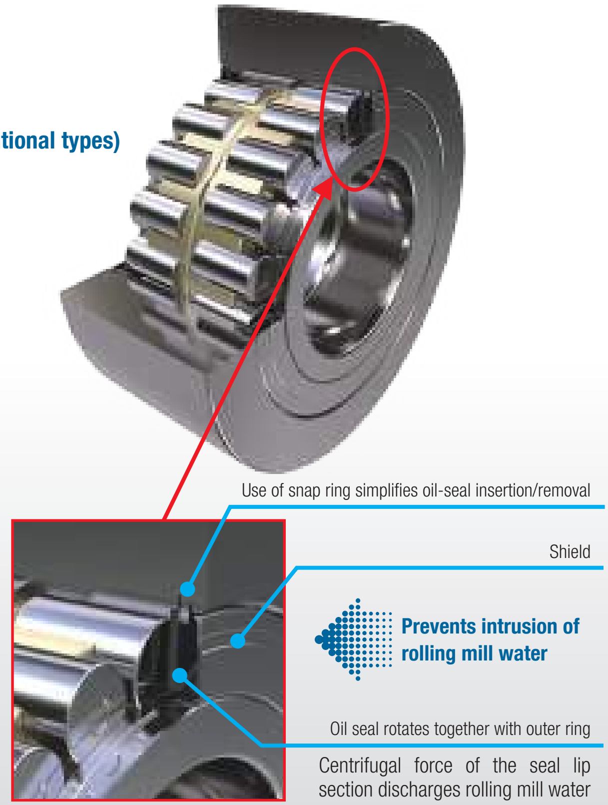
Approx.4-fold

JHS210 (premium specification)

Premium specifications

JHS 210 JTEKT HYPER STRONG

Case-hardened steel is used for the inner ring to suppress the loss of rolling service life under low-viscosity lubrication. Bearing service life is approx. 4-fold compared to the conventional type.



Centrifugal force of the seal lip section discharges rolling mill water that has infiltrated to the outside

🟩 Longer inner ring rolling fatigue service life 🟥 Improving outer ring durability 🟦 Improving outer ring rotational accuracy

Bearing for forced oil lubrication

Advantages

- **Outer ring with both high rigidity and durability realized**
- **High resistance to fatigue realized owing to superior materials composition**
- **Design optimized to match surrounding structure**

【Service life】

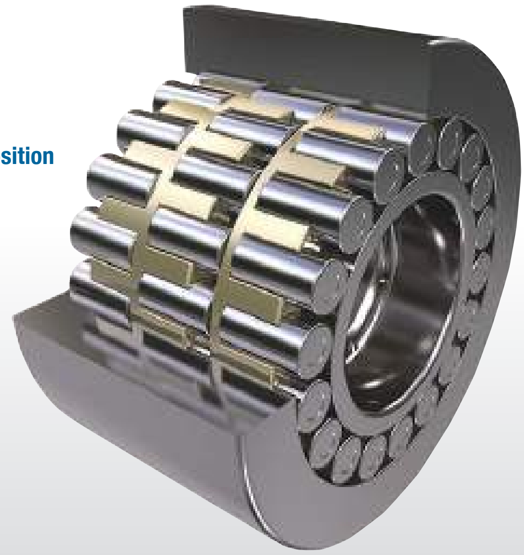
Conventional type

Approx.1.5~3-fold JHS210 (premium specification)

Premium specifications

JHS 210 JTEKT HYPER STRONG

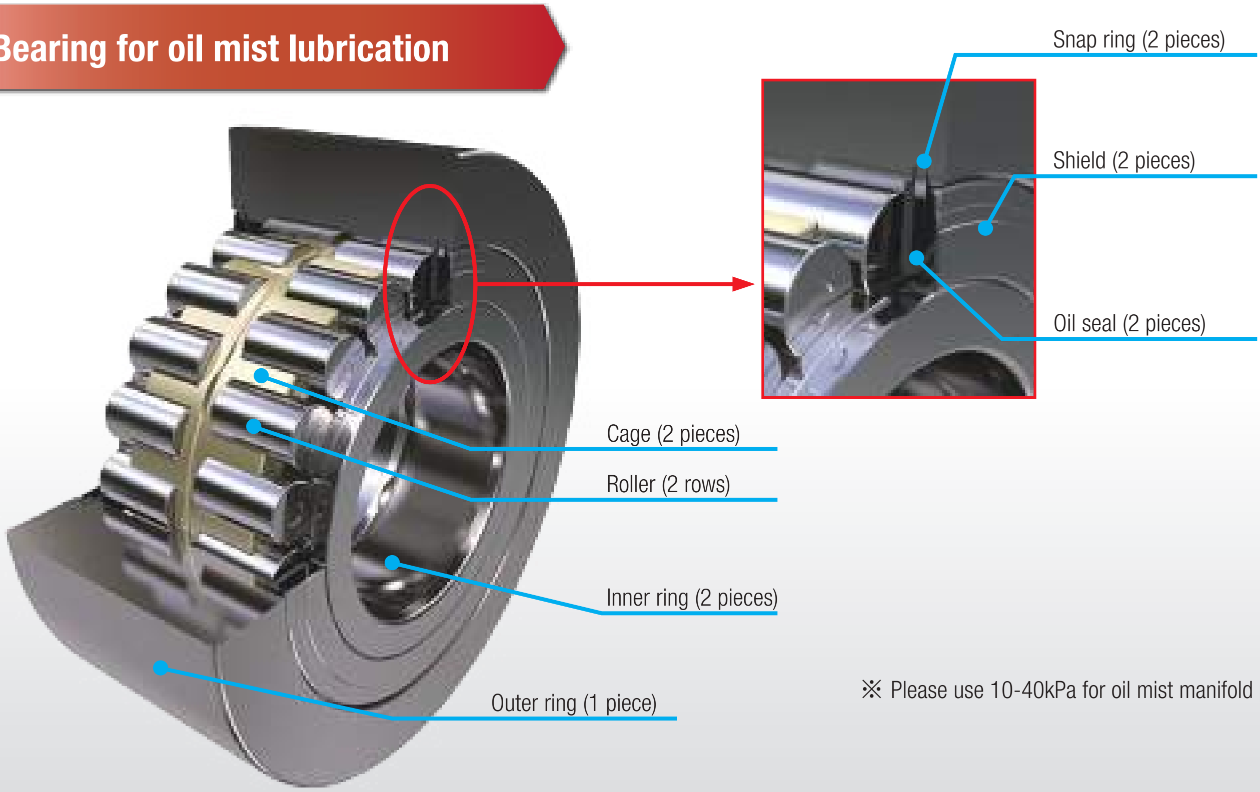
Case-hardened steel is used for the inner ring to suppress the loss of rolling service life under low-viscosity lubrication. Bearing service life is approx. 1.5~3-fold compared to the conventional type.



Bearing instruction

Here is an illustration of how we disassemble, assemble and inspect the bearings. Please follow this for bearing maintenance.

Bearing for oil mist lubrication



※ Please use 10-40kPa for oil mist manifold pressure.

Inner ring disassembling points

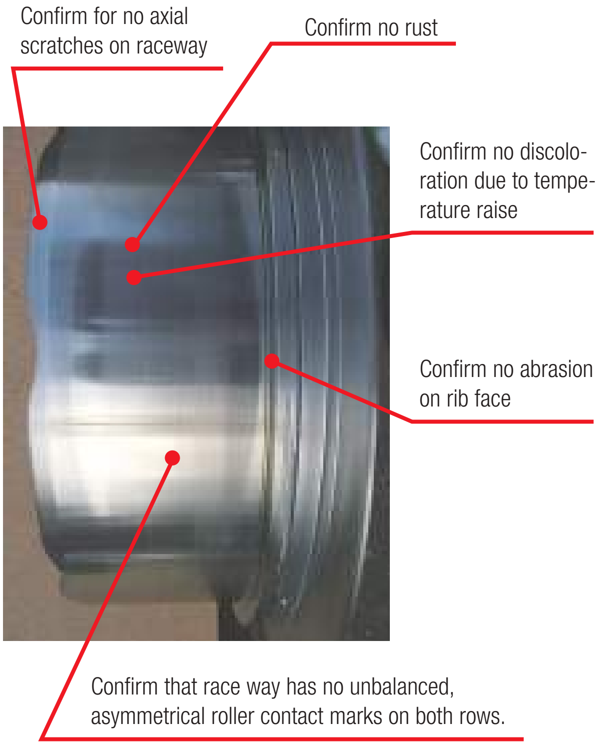
(1) Remove inner rings (both rings)

Shield will be removed with inner rings due to the press-fitting of the inner ring.

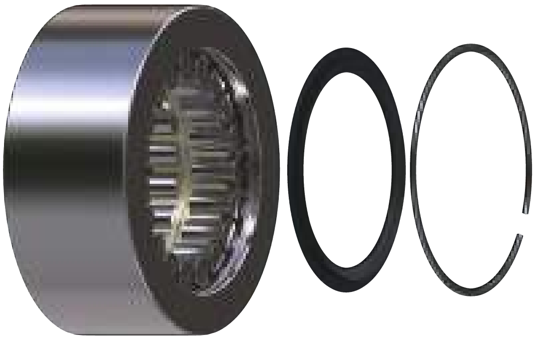
【!】Caution

Be careful when handling the shield. Any damage to shield may affect the performance of the bearing’s sealing.

Inner ring inspection points



Oil seal disassembling points



(2) Remove snap ring (both pieces)

(3) Remove oil seals (both pieces)

【!】Caution

Be careful to not scratch the oil seal when removing the snap ring and oil seal.

Oil seal inspection points

Confirm no cracking or chipping on seal lip part

【!】Caution

In case of cleaning the oil seal with cleaning oil, please wipe off the cleaning oil immediately.

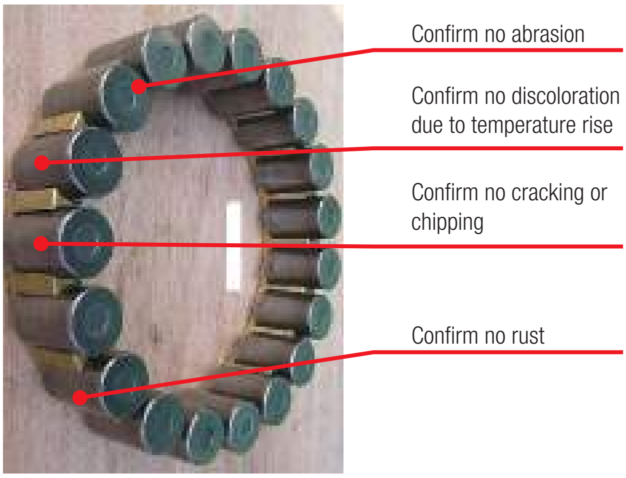
Roller・Cage disassembling points

(4) Hold the cage and remove it with the roller (both rows)

【!】Caution

Be sure to keep all rollers and other parts separate from other bearing parts and manage each bearing independently.

Roller inspection points



Confirm no abrasion

Confirm no discoloration due to temperature rise

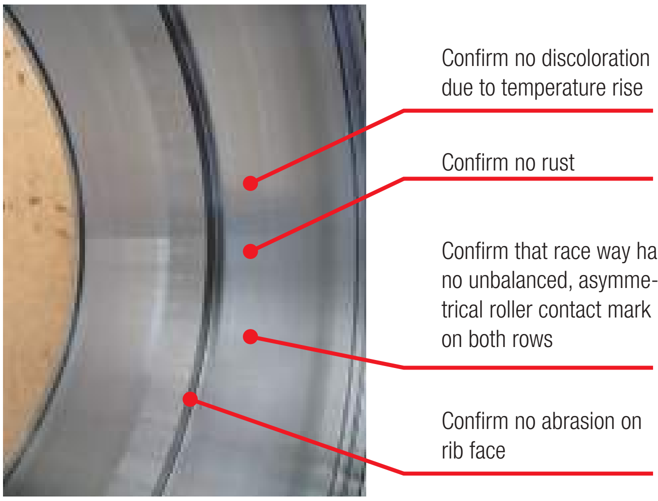
Confirm no cracking or chipping

Confirm no rust

Outer ring inspection points

Confirm no cracking or chipping

Confirm no slipping scratches or brinelling



Confirm no discoloration due to temperature rise

Confirm no rust

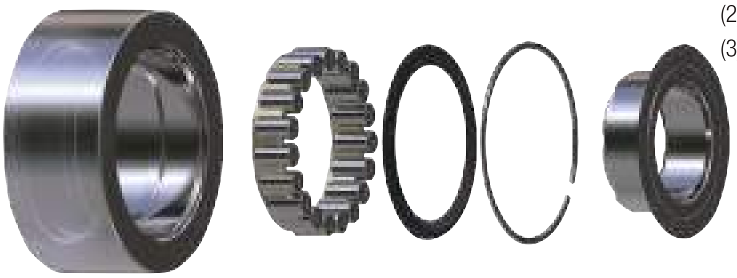
Confirm that race way has no unbalanced, asymmetrical roller contact mark on both rows

Confirm no abrasion on rib face

Bearing instruction

Here is an illustration of how we disassemble, assemble and inspect the bearings. Please follow this for bearing maintenance.

Assembling cylindrical roller bearings for backup rolls

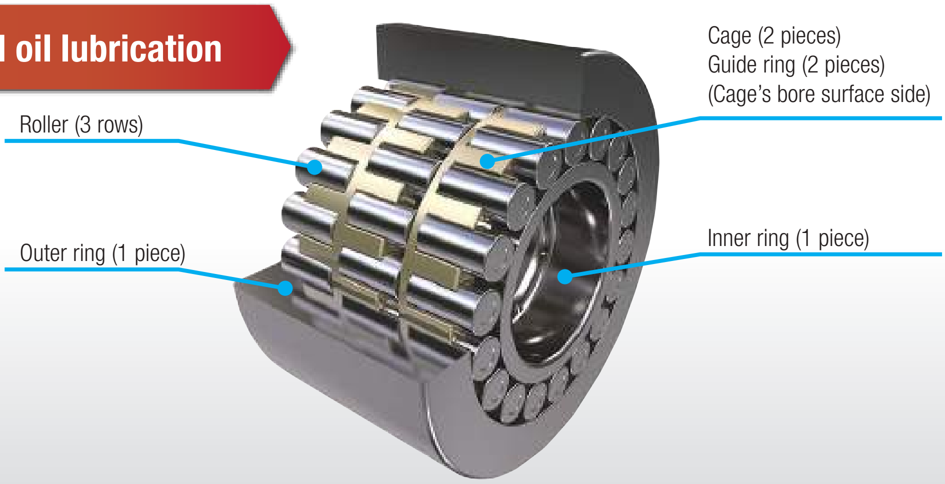


(1) Complete cleaning of each part before re-assembling.
(2) Assemble the bearings in the reverse order of disassembling.
(3) Before inserting the inner ring (with shield), supply the initial lubricate oil (mist oil) into the bearing.

【!】Caution

- Be careful to insert only appropriate bearing parts. There are no compatible parts with other products.
- During re-assembly, be careful not to contaminate the bearing with any foreign matter. Please handle with care so as not to scratch any surfaces of the bearing.

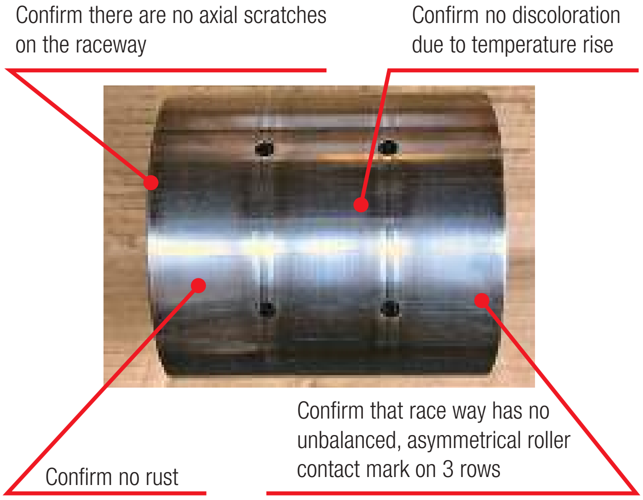
Bearings for forced oil lubrication



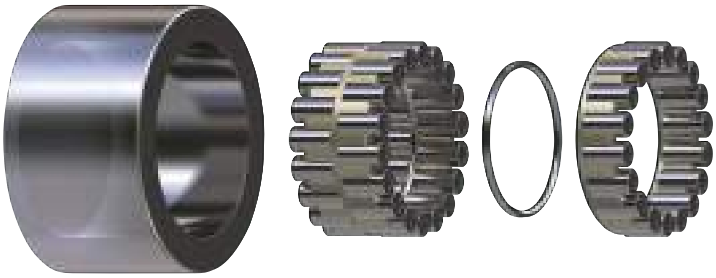
Inner ring disassembling points

(1) Remove inner ring (1 piece)

Inner ring inspection points



Roller ·Cage disassembling points



(2) Hold the cage and remove it with roller (2 rows and 1 row)

【!】Caution

Be sure to keep all rollers and other parts separate from other bearing parts and manage each bearing independently.

Roller inspection points

Outer ring inspection points

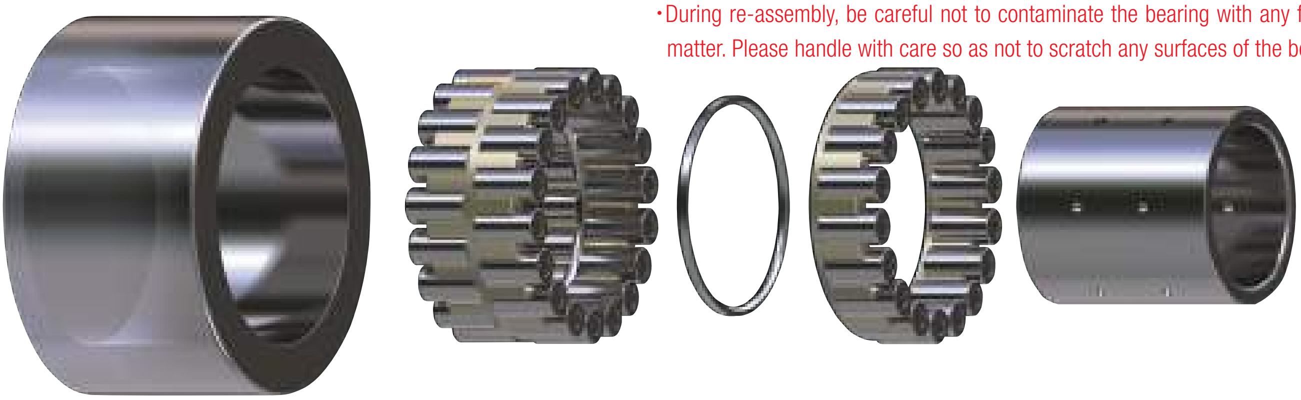
Assembling cylindrical roller bearings for backup rolls

(1) Complete cleaning of each part before re-assembling

(2) Assemble the bearings in the reverse order of disassembling

【!】Caution

- Be careful to insert only appropriate bearing parts. There are no compatible parts with other products.
- During re-assembly, be careful not to contaminate the bearing with any foreign matter. Please handle with care so as not to scratch any surfaces of the bearing.



Examples of bearing failures and countermeasures

JTEKT's countermeasures for various failures. Please follow this bearing maintenance program for optimum performance.

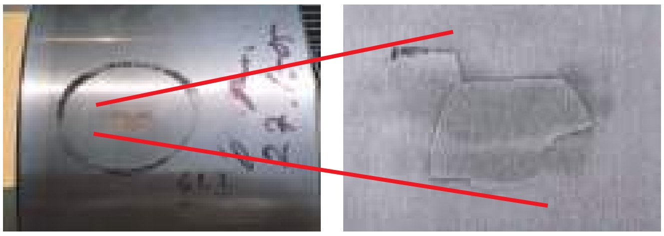
Outside surface of outer ring's slipping scratches and grinding burn

Outside of outer ring's slipping scratches

<Probable causes>
- Slip with the intermediate roll (Sheet jam, involution and so on)

<Countermeasures>
- Review operating conditions

<Countermeasures>
- After removing the slipping scratches on outer surface of the outer ring, a minimum of 0.5mm re-grinding on outer ring diameter needs to be done.



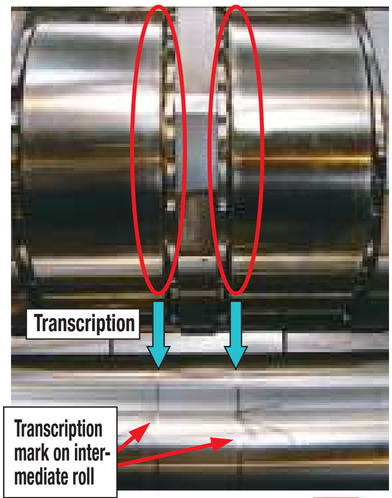
Outside of outer ring's grinding burn

<Probable causes>
- Improper regrinding of outer ring (Heavy grinding, lack of grinding fluid, clogged grinding stone, etc.)

<Countermeasures>
- Optimizing the grinding conditions, improving grinding stone

<Countermeasures>
- dispose

Transcription mark on intermediate roll



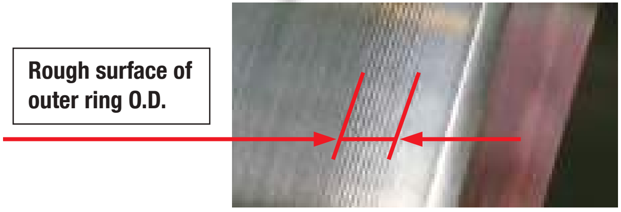
Outside of outer ring's slipping scratches

<Probable causes>
- Improper regrinding of outer ring(Clogged grinding stone) →rough outside surface (include scratches and foreign matter) →occurrence of transcription mark on intermediate roll

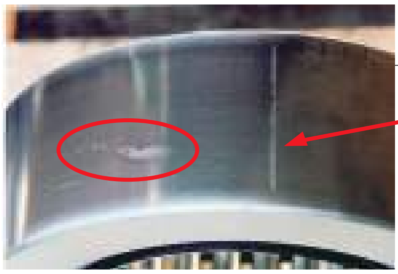
<Countermeasures>
- Optimizing grinding conditions, improving grinding stone and cleaning outside surface and shaft

<Countermeasures>
- Reusable by grinding outside surface
- Reusable by grinding intermediate roll

Expansion of crowning part on outer ring O.D.



Brinelling on raceway



Brinelling on outer ring O.D.

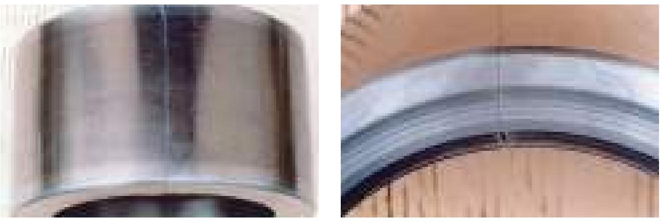
Brinelling on raceway surface of outer ring

<Probable causes>
- Foreign matter jam (rolling material's fragmentation, etc.)

<Countermeasures>
- Rolling oil cleaning

<Countermeasures>
- Reusable by regrinding outside surface. Reusable by lapping raceway surface. However, if damage is too severe, dispose

Raceway ring's cracking



Outer ring cracking

<Probable causes>
- Outside surface damage progresses from slipping scratches.
- Side surface damage progresses from heat cracks (due to slipping with thrust washer.)

<Countermeasures>
- Remove the slipping scratch by regrinding the outer ring O.D.
- Proper management of thrust washers

<Countermeasures>
- dispose

Inner ring cracking

<Probable causes>
- Excessive axial load due to misaligned roll or irregular section height of bearings in one shaft.

<Countermeasures>
- Restraining misalligned roll
- Control of section height of bearings in one shaft

<Countermeasures>
- dispose

Raceway・roller flaking

Raceway flaking

Roller flaking

<Probable causes>

- Rolling fatigue service life, excessive loading, improper lubrication

<Countermeasures>

- Review operating conditions
- Review viscosity of oil lubrication

<Countermeasures>

- dispose

However, in the case of minimal flaking of the inner ring, it's reusable by removing the flaking and setting in an unloading position

Rust・scratches

Rust

<Probable causes>

- After use, equipment has been left for a long period without disassembling
- Improper storage condition
- Intrusion of mill water

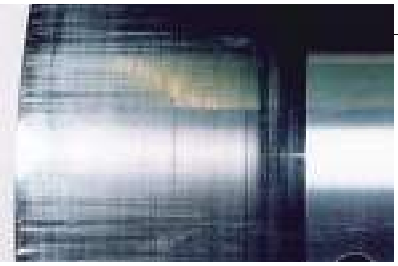
<Countermeasures>

- After use, disassemble and clean as soon as possible
- perform rust prevention maintenance
- confirm the seals condition

<Countermeasures>

- Reusable by lapping using oil grinding stone or sandpaper
- In case of severe condition, dispose

Scratches



<Probable causes>

- Scratches during bearing's disassembling or re-assembling

<Countermeasures>

- Appropriate caution during bearing's disassembling and re-assembling

<Countermeasures>

- Reusable by lapping using oil grinding stone or sandpaper
- In case of severe condition, dispose

Smearing or abrasions

Roller Smearing

<Probable causes>

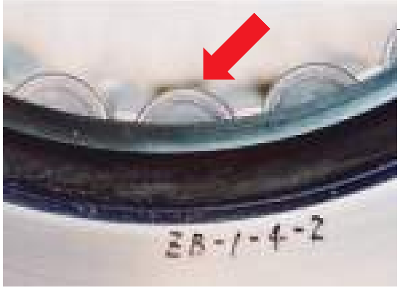
- Minimal loading
- improper lubrication

<Countermeasures>

- proper loading
- review lubricant condition

<Countermeasures>

- Reusable by lapping using In case of severe condition, dispose (when picture's state, dispose)



Roller abrasion

<Probable causes>

- Bearing misalignment
- improper lubrication
- Foreign matter jam

<Countermeasures>

- Maintaining alignment of the bearing
- review lubricant condition

<Countermeasures>

- usually disposal

Raceway wear

Raceway wear

<Probable causes>

- Excessive loading
- improper lubrication

<Countermeasures>

- proper loading
- review lubricant condition

<Countermeasures>

- Usually disposal

Fretting on bore surface of inner ring

<Probable causes>

- Loose fitting between shaft and inner ring

<Countermeasures>

- (It is not possible to change the shaft and inner ring fit independently)
- Apply lubricant into the fitting surface of the shaft and inner ring Appropriate operating period

<Countermeasures>

- Reusable by lapping using oil grinding stone or sandpaper

Improving ease of outer ring regrinding work

We provide regrinding jigs which are capable of grinding the outer ring outside diameter of the bearing with high accuracy.

Bearing-regrinding Jigs

Required performance and issues

🟧 **Improving ease of outer ring regrinding work**

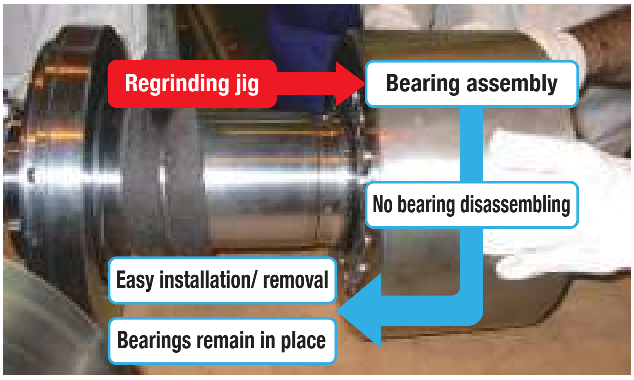
Advantages

- **The jigs minimize the radial run out of the bearings after regrinding.**

Once the bearing is installed into the jig, the jig completely nullifies any clearance on the fitting surface between the jig and bearing and the Internal clearance of the bearing, eliminating play in the radial direction. The jig grinds the outside diameter surface while turning the outer ring and retaining the inner ring as stationary, enabling grinding under the same conditions as when in operation. Grinding of the bearings radial run-out can be performed with a high level of accuracy.

- **The jigs improve efficient installation and removal**

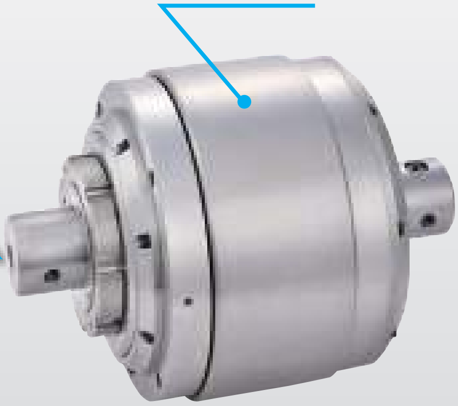
Bearings can be installed on and removed from the jig easily without the need of disassembling the inner ring and outer ring. There is no possibility that rollers will come off.



Overview

The outer surfaces of the bearings used on the backing shafts of multi-roll mills should be ground periodically to retain precise bearing performance, thus ensuring the quality of rolled products. **JTEKT** supplies the jigs that grind bearing's outside diameter surface with high precision.

Regrinding jig



Bearing assembly

Cylindrical grinder for outer ring-regrinding

JTEKT provides the GE series which is capable of processing both roll grinding and outer ring-regrinding with high accuracy using cylindrical grinders. (TOYODA brand)

Mounting the regrinding jig and
bearing assembly to the cylindrical grinder

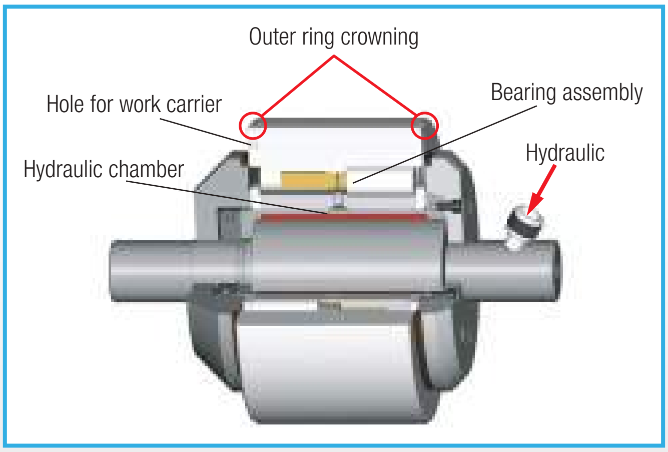
cylindrical grinder（GE6i-PRO）

Jig type and constructions

The jigs come in two types, which should be selected according to the dimensions and types of backing-shaft bearings. Please specify the type suitable to your needs.

Type 1

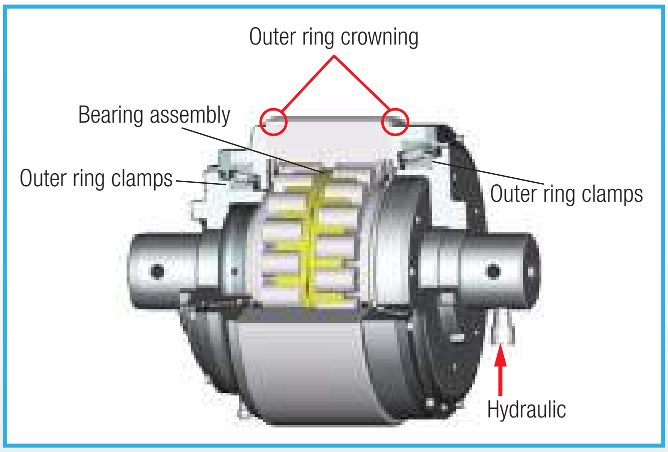
This type of jig is suitable for bearings over 70mm bore with an outer ring rib.
This jig requires a hole for the work carrier on the side face of outer ring.



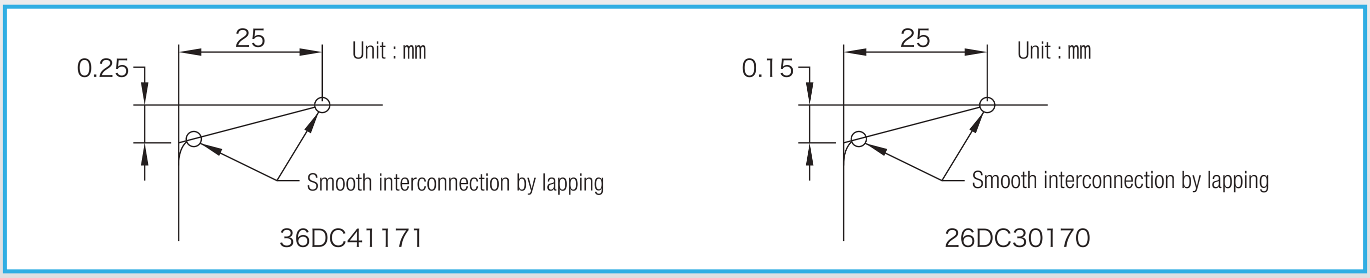
Typical installation of suitable bearing on jig Type 1

Type 2

This type of jig is suitable for both bearings with and without outer ring rib.
It is used on the Sendzimir Rolling Mills ZR21 and ZR22.



Typical installation of suitable bearing on jig Type 2



Example of Outer ring crowning dimensions

Measurement for bearing section height

Advantages

- possible to measure to 1/1000mm
- possible to measure bearings radial run-out
- easy bearing installation / removal

Overview

When the outer surface of a bearing is ground, it is critical to accurately control the variation of bearing's section heights of all the bearings installed on the backing shaft. **JTEKT** supplies Measurement for bearing section height that suit the individual bearings listed on the dimensional table.

Large size bearing technology development center

JTEKT's accumulated knowledge and experience helps our customers solve problems. We provide new high value-added products and processes for businesses by having developed a global supply system to meet those demands.

JTEKT established a large size bearing technology development center to evaluate and analyze large size bearing uses in the industrial machinery field.

Until now, with regards to large size bearings used in the industrial machinery field, investment was made in the actual machines before accurate modeling was done resulting in customer dissatisfaction. As a result, development time took too long due to the problems that arose.

Now, we are able to simulate and evaluate production conditions close to the real machines in our large size bearing technology developing center.

The accumulated data for bearing testing equipment for steel production equipment introduced has allowed us to improve the accuracy of CAE analysis (simulation analysis) which gives us a significant reduction for the products developmental period and in the development of new high value-added products for the future.

Bearing testing equipment for steel production equipment

Our testing equipment is able to evaluate the scattering rolling mill water under a high temperature environment to recreate close to actual conditions.

In this way, we can deliver bearings and oil seal components with excellent performance.

High-performance Product Series

for Steel Production / Rolling Equipment

CAT.NO. BA010EN-0CH

JTEKT...
Utilizing comprehensive strengths to manufacture products that respond to steel production equipment needs and support stable operations.

Steel production equipment are operated in extremely harsh environments, where machinery is exposed to high temperatures, water and mill scale. The bearings used in this equipment must continually withstand heavy loads and high-speed rotation. These conditions test not only each bearing, but also the overall strengths of peripheral parts and the integration thereof. As a general manufacturer of bearings, drive shafts and oil seals, JTEKT is a full- service provider for a wide range of products.

Only One Partner

JHS
JTEKT HYPER STRONG

JHS (JTEKT Hyper Strong) is a product series incorporating designs to meet the requirements of various industrial machinery.
In order to achieve high-durability of ever-evolving steel production equipment, JHS is evolving daily together with JTEKT customers and provides total support for bearings, drive shafts and oil seals.

JHS Series

Bearings

- **RZ-type Spherical Roller Bearings** (CAT.NO.B2023E)
- **Bearings for multi-roll mill backup rolls** (CAT.NO.B2012E)

JHS 210
Case-hardened steel is used on the inner ring to improve rolling life in low-viscosity lubrication.

- **Bearings for roll necks** (CAT.NO.B2013E)

JHS 520

Standard
By using our newly developed case-hardening steel in the bearing rings, we have improved the rolling life, toughness, and corrosion resistance.

Premium
A special heat treatment is applied to the newly developed hardened steel to further improve rolling life and corrosion resistance.

- **Bearings for sintering machine pallet car**

Drive shafts

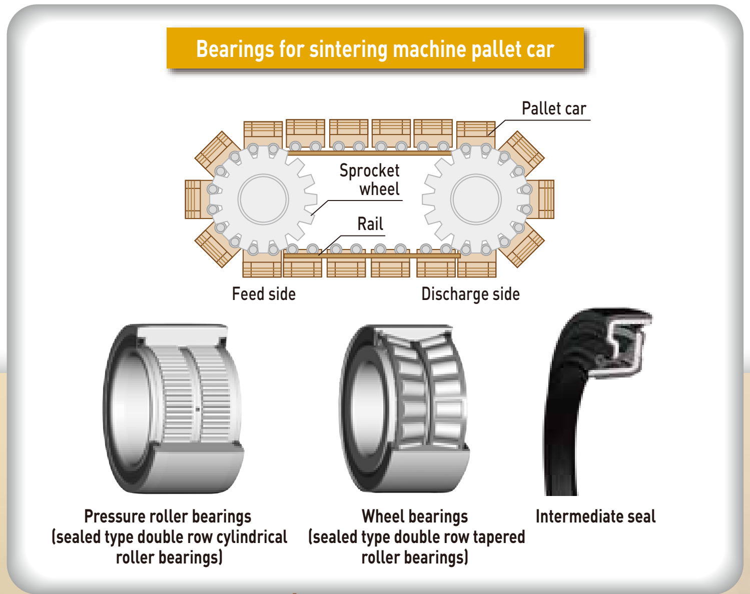
- **Drive shaft for roll drives** (CAT.NO.B2021E)
- **Hyper coupling** (CAT.NO.B1010E)

We will continue our efforts to enrich the JHS series.

History of JTEKT products for steel production equipment

Year	Social conditions /events	Steel manufacturer trends		(□ Bearings 🟧 Drive shafts)
1940	WWII Post-WWII	Catch-up with industry overseas	Domestic production of bearings for rolling mills	• Developed four-row tapered roller bearings for hot-strip mill work rolls Japan 1st • Developed tapered roller bearings for hot-strip mill backup rolls Japan 1st
1950	High growth period			
1960		Mass production; increase productivity; high-load/ high-speed/continuous	Development of high-performance bearings (longer service life, high-speed compatibility) Introduction of overseas Drive shafts technologies; domestic production	• Developed three-row cylindrical roller bearings with cage for Sendzimir mills • First delivery of drive shafts for wire-rod mills Japan 1st
1970	Stable growth period			• Entered agreement with Sendzimir Japan, Ltd. to manufacture backup roll assemblies • Started production of Sendzimir mill backup roll assemblies Unique to Japan • Adopted roller bearings for 1,680m/min cold-strip mill backup rolls Japan 1st • First delivery of drive shafts for cold-strip mills Japan 1st • First delivery of drive shafts for hot-strip mills Japan 1st
1975				• Received award from the Japan Society of Mechanical Engineers for hot-strip mill drive shaft • Developed sealed cylindrical roller bearings for Sendzimir mills
1980		Large-variety, low-volume production; improve thickness accuracy; reduce maintenance cost	Development of bearings/drive shafts compatible with shape-controlled rolling mills Longer-life bearings/drive shafts and extended maintenance interval	• Developed (sealed) roll neck bearings for 6HI work roll shift mills • Improved bearings for backup rolls from oil-film bearings to roller bearings Japan 1st • Developed split bearing units (spherical Roller bearings)
1985	Bubble economy			• Developed CR mill backup roll assemblies • First delivery of drive shafts for hot-strip WR shift mills Japan 1st • Developed fastening-ring split bearing units with fastening-ring • Developed cylindrical roller bearings with self-aligning ring
1990	Burst of bubble / Economic stagnation			• Developed oil/air lubrication system • Developed long-life Cross & Bearing with different diameter rollers • First delivery of drive shafts for pair cross mills • Developed carburized steel (CH213) for large bearings
1995				• Developed HSC split bearing units • First delivery of drive shafts for Plate mills World 1st
2000	Economic expansion	Pursue higher functionality/better quality		• Developed new material for core hardening • Developed sealed cylindrical roller bearings for new Sendzimir mill producing magnetic steel sheets • Developed long-life Cross & Bearing with cross burnishing process
2005	Period of economic change			• Fiest delivery of hyper coupling • Adopted newly developed material and carbonitriding process (premium) for JHS520 highly corrosion-resistant long-life bearings
2010				• Developed JHS210 high-performance backup roll bearings for new Sendzimir mill producing magnetic steel sheets • Developed a long-life, high-speed JHS Series spherical roller bearings • Commenced full-scale operation of the Large Bearing Technical Development Center
2015				• Developed an oil seal for sealed-type, four-row tapered roller bearings, for roll neck • Developed an oil seal for drive shaft cross bearings

Introduction to products for steel production equipment

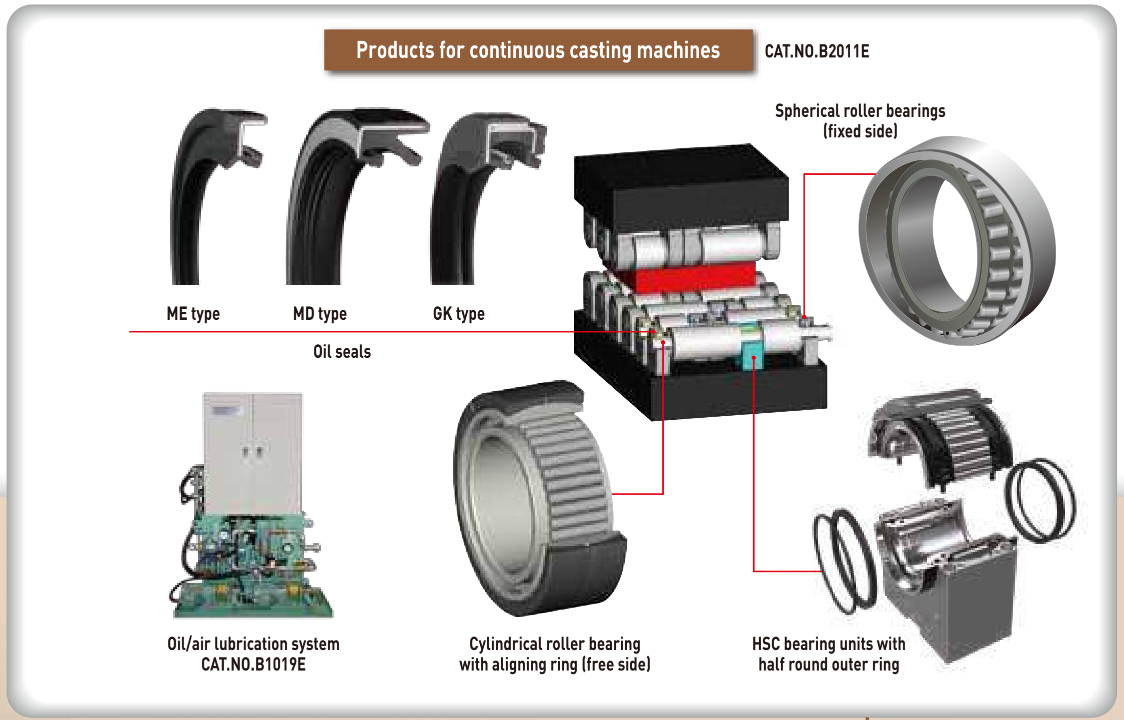


Bearings for sintering machine pallet car

Pressure roller bearings (sealed type double row cylindrical roller bearings)

Wheel bearings (sealed type double row tapered roller bearings)

Intermediate seal



Products for continuous casting machines

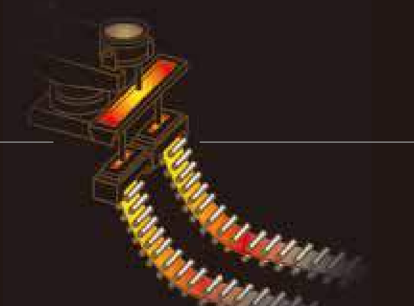
Rolling

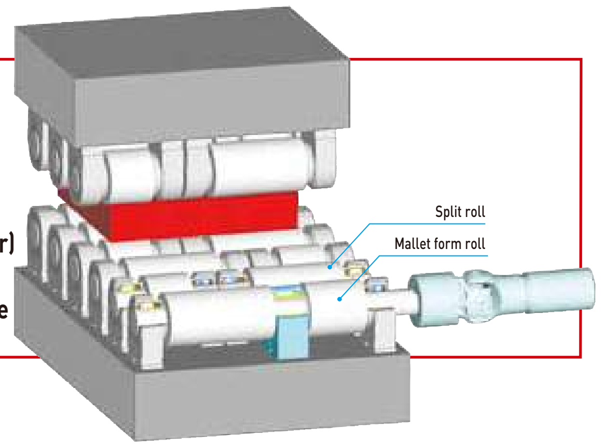
Products for continuous casting machines



Offering long-life bearings for systems, we manufacture bearings for continuous casting equipment, bearing housing units, oil/air lubrication devices, oil seals and other products.

Required performance and issues

- 🟩 Measures for high contact stress/roll deflection under heavy load
- 🟥 Measures for roll elongation under high temperature
- 🟦 Measures for corrosion / lubrication failure due to the infiltration of steam (water)
- 🟧 Measures for surface roughness / indentations due to the intrusion of mill scale

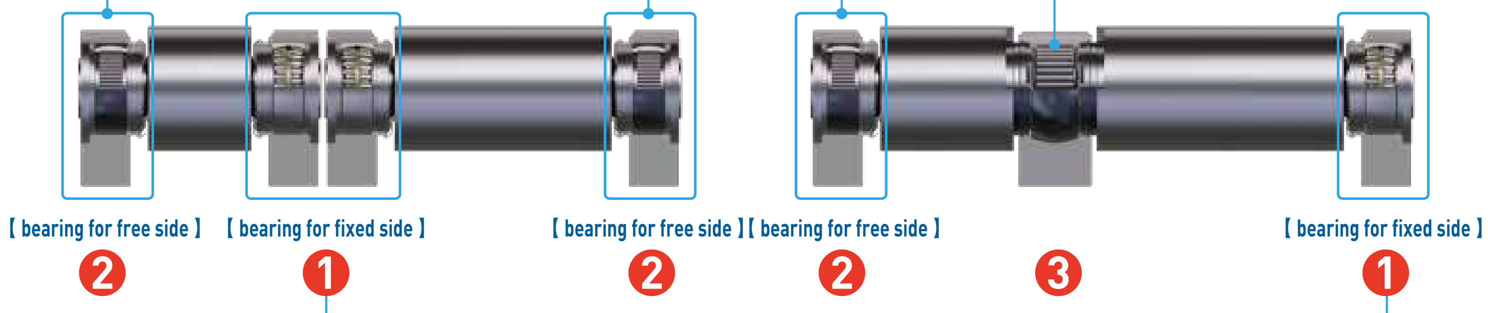


Roll configuration example 1 (single and split rolls)

Optimal configuration for roll elongation absorption using single and split rolls

Roll configuration example 2 (pestle-shaped roll)

Optimal configuration for roll elongation absorption using pestle-shaped roll

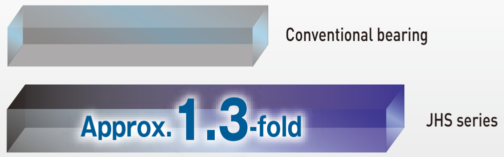


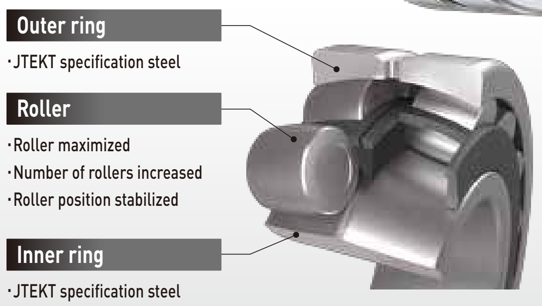
🟩🟥 Measures for heavy load / high temperature

① RZ-type Spherical Roller Bearings

Features
- Designed for maximum load rating; internal design reduces contact stress
- Designed to stabilize roll position
- Resistant to high temperature for use in various environments

[Service life]





Outer ring
- JTEKT specification steel

Roller
- Roller maximized
- Number of rollers increased
- Roller position stabilized

Inner ring
- JTEKT specification steel

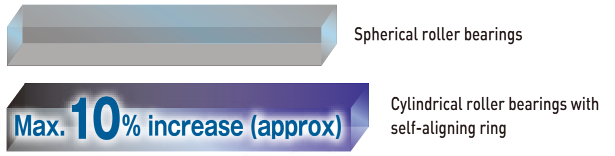
Bearing composition diagram

🟩🟥 Measures for heavy load / high temperature

② Cylindrical roller bearings with self-aligning ring

Features
- Smooth absorption of roll movement in the axial direction
- Absorption of roll deflection and misalignment

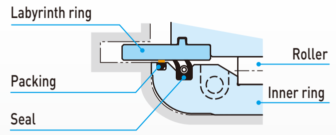
[Static load rating]



③ HSC bearing units with half round outer ring

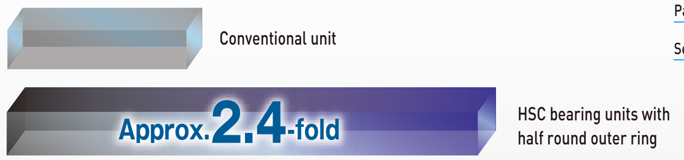
Features
- Heavy load type using a compact sealing structure
- Water-cooled structure with high cooling efficiency

[Compact sealing structure]

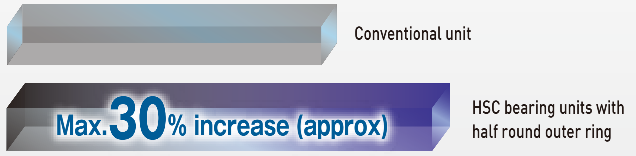


[Cooling structure]

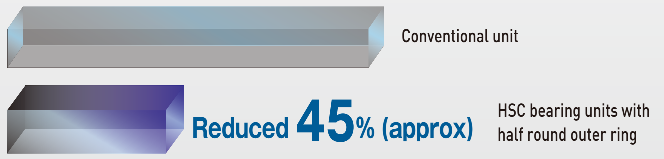
[Service life]



[Rated static load]



[Flow consumption]



🟦🟧 Measures for intrusion of water / mill scale

Oil seals

Features
- Superior sealing performance
- Lip contact stress dispersed
- Materials used are hydrogenated nitrile rubber (HNBR) and fluoro rubber (FKM)

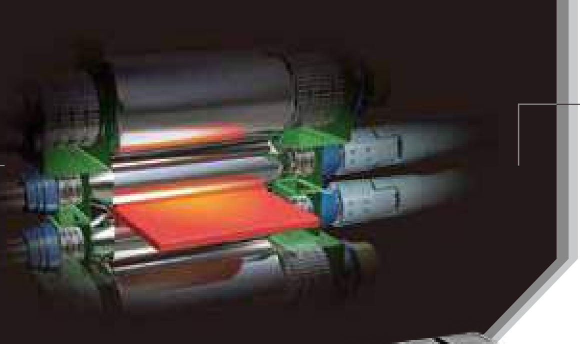
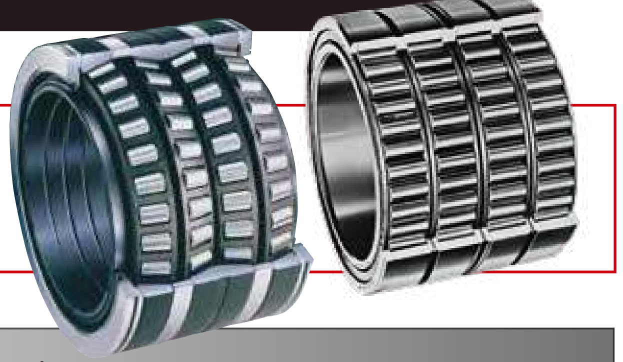
Bearings for roll necks

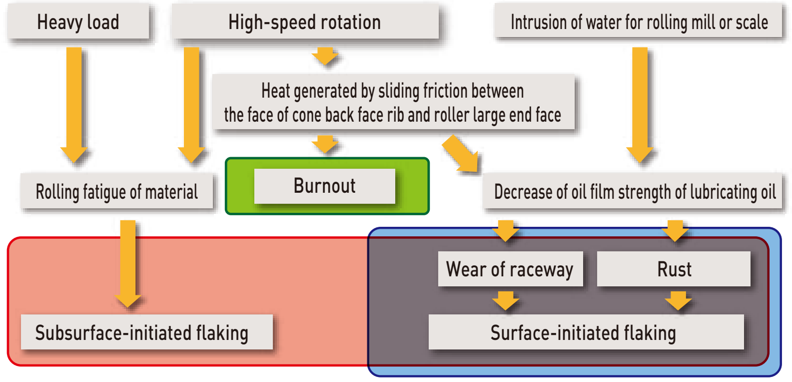
Bearings used to steel mill roll necks must cope with heavy loads and high-speed rotation in severe environments. In order to respond to these needs, JTEKT works daily to resolve related issues such as developing bearing materials and improving bearing seal performance.





Required performance and issues

- 🟥🟩 Enhancing durability and service life under heavy load / high-speed rotation
- 🟦 Preventing the intrusion of water / mill scale



(Countermeasure technologies)

- 🟥 Long-life/high corrosion-resistant steel
- 🟩 Minimizing temperature increases
- 🟦 High-performance seal

🟥 Improvement of durability and service life to withstand heavy loads and high-speed rotations

Long-life / high corrosion-resistant carburized steel

JHS 520
JTEKT HYPER STRONG

◆ **Standard**
By using our newly developed case-hardening steel in the bearing rings, we have greatly improved the rolling life, toughness, and corrosion resistance compared to our conventional products.

◆ **Premium**
By using our newly developed case-hardening steel and by applying special heat treatment, we have provided the premium specification with further improved rolling fatigue life and corrosion resistance.

Features

① Long-life and high corrosion-resistant steel with optimized content of chromium and molybdenum

② Original carbonitriding heat treatment improves corrosion-resistance and wear-resistance qualities

	Results of evaluations of bearings in an environment prone to rust (filled with water-mixed grease)		Results of evaluations of bearings in clean oil
	Rust resistance comparison	Rust resistance comparison Life (JTEKT bench test)	
Conventional product			
Developed steel, carburized product ① (JHS520 standard)		Approx.2.2-fold	Approx.4-fold
Developed steel, special heat treated product ①+② (JHS520 premium)		Approx.3.8-fold	Approx.7-fold
Test conditions	Humidity cabinet test conditions Test temperature: 49°C ± 1°C Relative humidity: 95% or more Test period: 96 hours	Sample: Tapered roller bearing Main dimensions: ø50 × ø120 ×30 Lubrication: Grease (water content ratio, 30%)	Test piece form: 20 mm dia., 32 mm length Maximum contact stress: 5 800 MPa Loading cycle frequency: 285 Hz Lubricating oil: Turbine oil (ISO #VG68) Oil supply: 2 L/min (room temperature) * Test was stopped after 50 × 107 times.

Examples of actual use

Cold strip mill work roll (open type) ① [JHS520 standard]

Conventional type

Used approximately 4 million tons (under DS)

Approx.5-fold

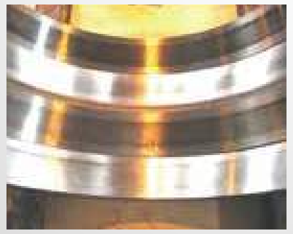
No flaking

Cold strip mill work roll (sealed type) ①+② [JHS520 premium]

Conventional type

Used for approximately 24 mont (under OP)

Approx.4.8-fold



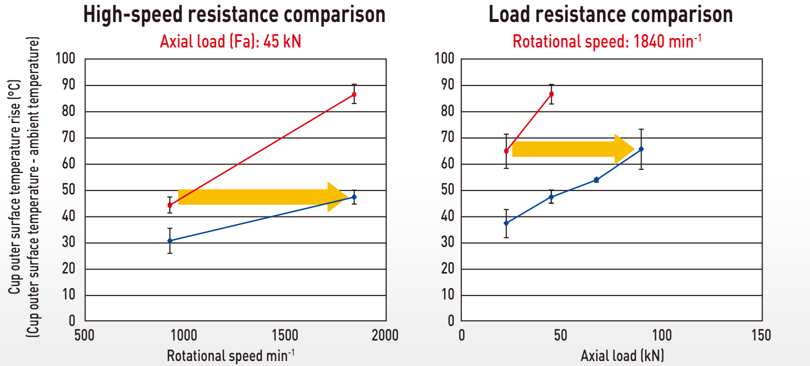
Hardly any indication of rust

🟩 Improvement of durability and service life to withstand heavy loads and high-speed rotations

Technology for minimizing temperature increases

Features

- On the basis of the EHL theory, improvement of the lubrication of the rolling part between the roller large end face and the face of cone back face rib
- Optimization of the shapes and suppression of temperature rising for the rolling part between the roller large end face and the face of cone back face rib



2 times the speed performance (at the same temperature rise)

4 times the load performance (at the same temperature rise)

🟦 Preventing intrusion of water / mill scale

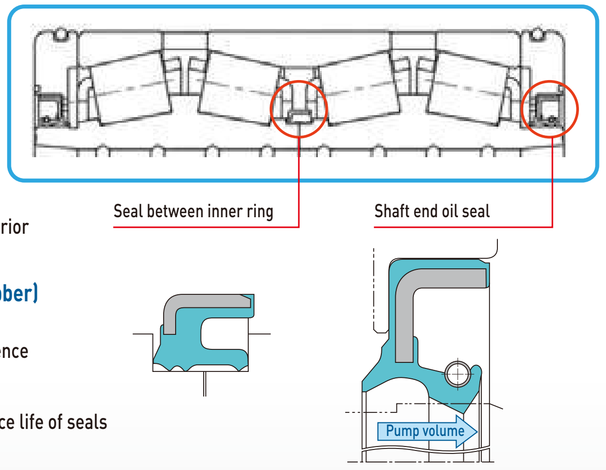
High sealing property oil seal for sealed-type, four-row tapered roller bearings

Features

① **Greater robustness due to improved sealing property**
- Optimization of seal lip shape
- Maximized pump volume and reduced the amount of water infiltration into the interior of the bearing by **70% or more compared to conventional**

② **Expanded application range of the conventional material (NBR: nitrile rubber)**
- Reduced seal lip temperature by **30% compared to conventional**
- Expanded the application range of common and low-cost NBR to improve convenience

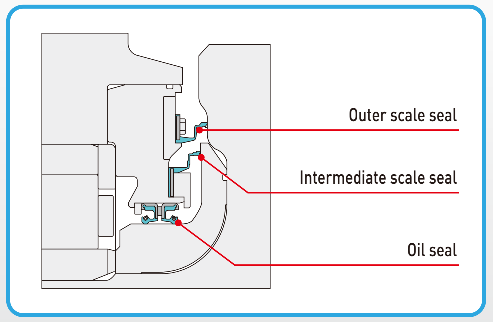
③ **Reduced maintenance costs**
- Contributed to reduction of customers' maintenance costs through extended service life of seals



Chock seals

Features

- Original design realizes an optimal lip structure that demonstrates excellent sealing performance



For more information, please refer to catalog No. B2013E and No.B2002E.

Bearings for multi-roll mill backup rolls

We provide high-precision bearings with excellent durability based on long years of experience and achievements.

Required performance and issues

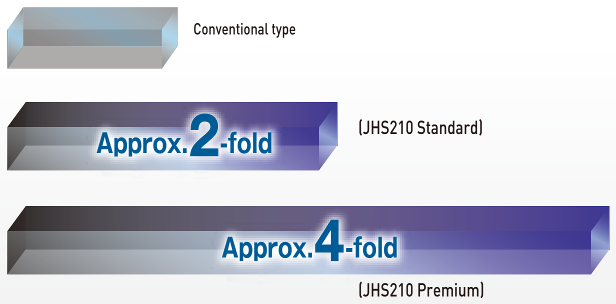
- 🟪 Seal structure that maintains a favorable lubricated state
- 🟩 Longer inner ring rolling fatigue service life
- 🟥 Improving outer ring durability
- 🟦 Improving outer ring rotational accuracy
- 🟧 Improving ease of outer ring regrinding work

🟪 Seal structure that maintains a favorable lubricated state 🟩 Longer inner ring rolling fatigue service life 🟥 Improving outer ring durability
🟦 Improving outer ring rotational accuracy

Bearings for oil mist lubrication

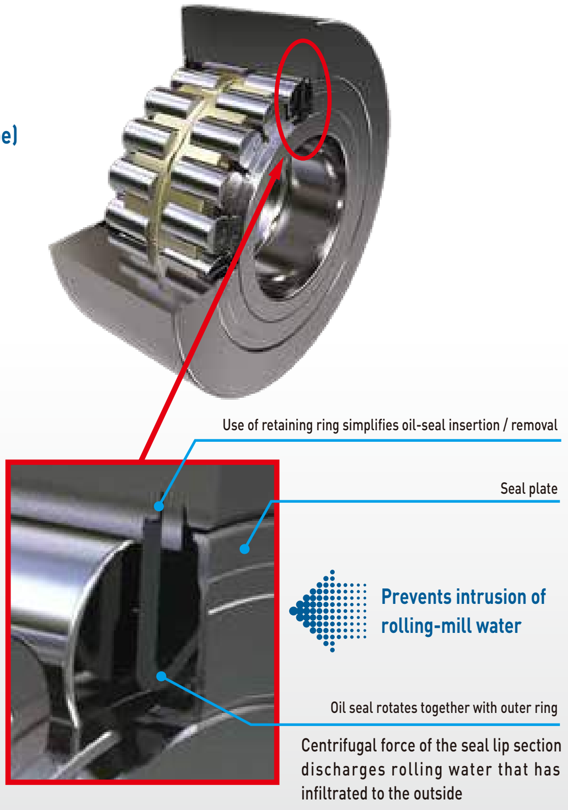
Features
- Improved bearing service life (2-fold/4-fold compared to the conventional type)
- High sealing performance
- Space-saving size for simple installation / removal

[Service life]



Premium specifications
JHS210 JTEKT HYPER STRONG

Case-hardened steel is used for the inner ring to suppress the loss of rolling service life under low-viscosity lubrication. For oil-seal materials, fluoro rubber is used, improving sealing performance and realizing an increase in bearing service life of approximately four-fold compared to the conventional type.



Centrifugal force of the seal lip section discharges rolling water that has infiltrated to the outside

---

🟩 Longer inner ring rolling fatigue service life 🟥 Improving outer ring durability 🟦 Improving outer ring rotational accuracy

Bearings for forced oil lubrication

Features
- Outer ring with both high rigidity and durability realized
- High resistance to fatigue realized owing to superior materials composition
- Design optimized to match surrounding structure

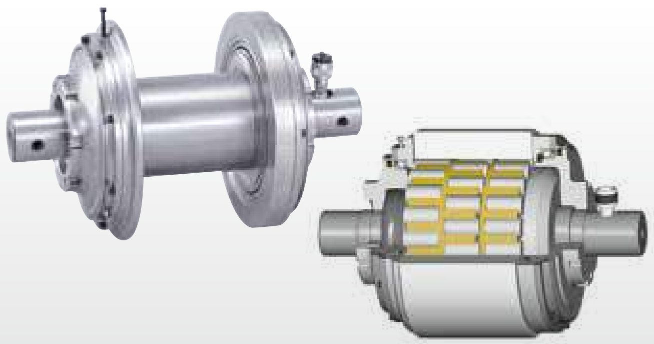
Premium specifications
JHS210 JTEKT HYPER STRONG

Case-hardened steel is used for the inner ring to suppress the loss of rolling service life under low-viscosity lubrication.
Bearing service life is approx. 1.5~3-fold that of conventional products.

🟧 Improving ease of outer ring regrinding work

Bearings-regrinding Jigs

Features
- Bearing radial runout minimized
- Installation / removal work simplified
- Reproduction of radial runout accuracy equivalent to that when product is new



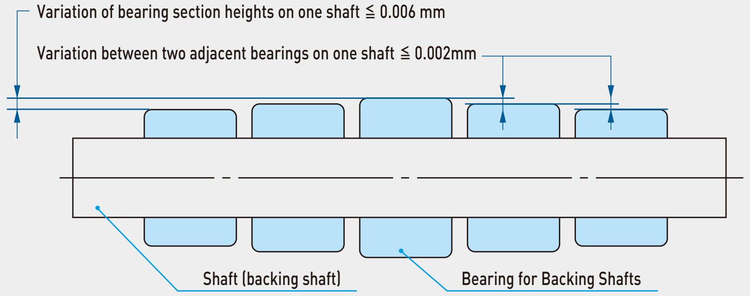
🟧 Improving ease of outer ring regrinding work

Measurement for Bearing Section Height

Features
- High rigidity, possible to make extremely accurate measurements
- Possible to measure outer ring rotational accuracy
- Adoption of mandrel shape realizes easy bearing insertion / removal

Optimized load distribution

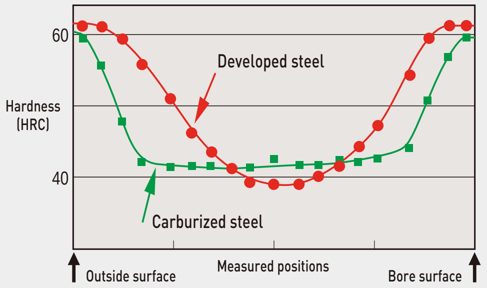
Contributes to rolled coil quality / precision



Core hardening

Surface-hardened layer improved approximately 3-fold

[Surface-hardened layer]



【 typical hardness distribution of cored hardening outer ring 】

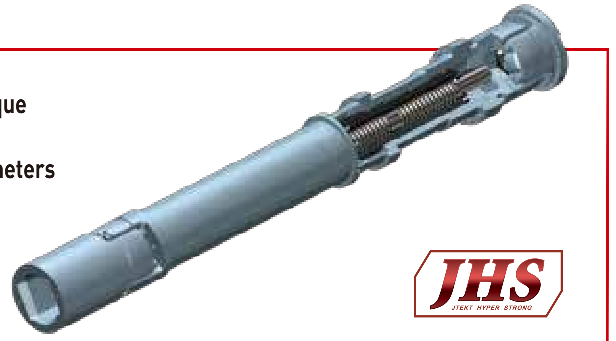
For more information, please refer to catalog No. B2012E.

Drive shafts for rolling mills

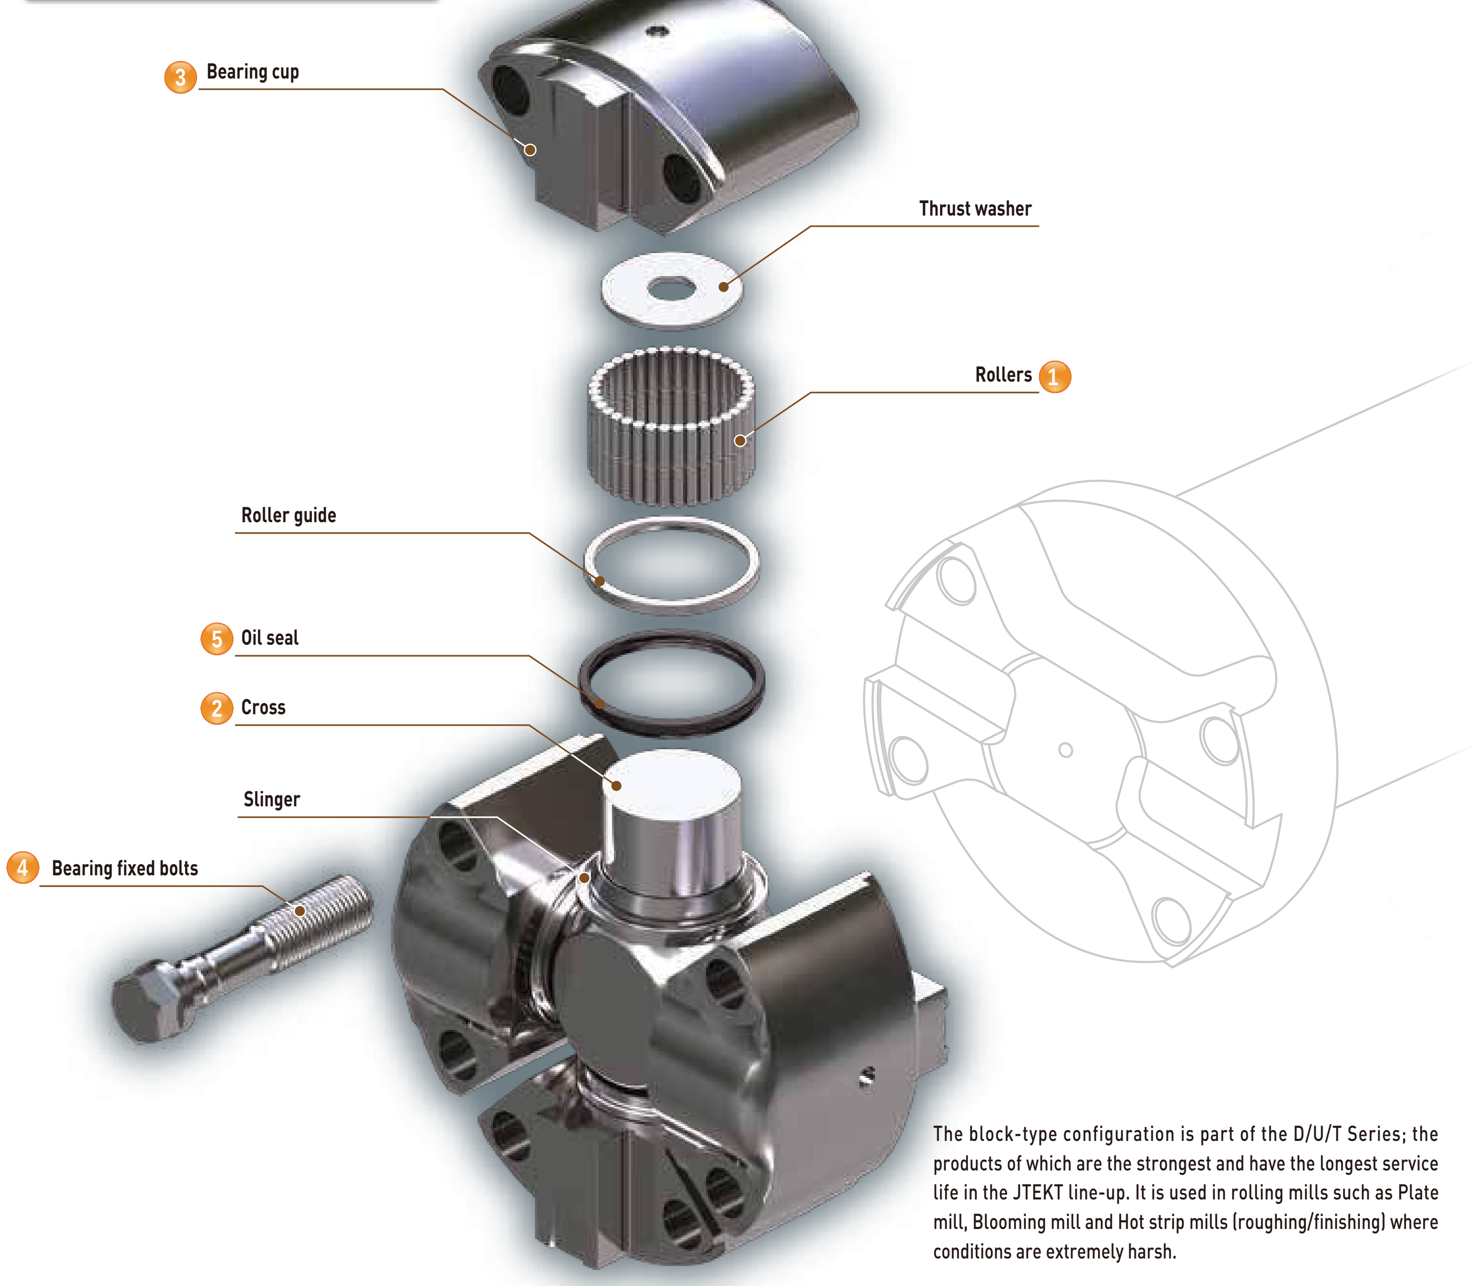
We provide high-strength, long-life drive shafts that have good torque transfer efficiency under severe environments.

Required performance and issues

- 🟪 Stronger, longer-life drive shafts capable of handling increased rolling torque
- 🟩 Stronger, longer-life drive shafts for use with smaller rolling-mill roll diameters
- 🟥 Protecting rolling-mill drive systems from excessive torque
- 🟦 Ability to randomly adjustment the roll rotational phase



Example of block-type configuration



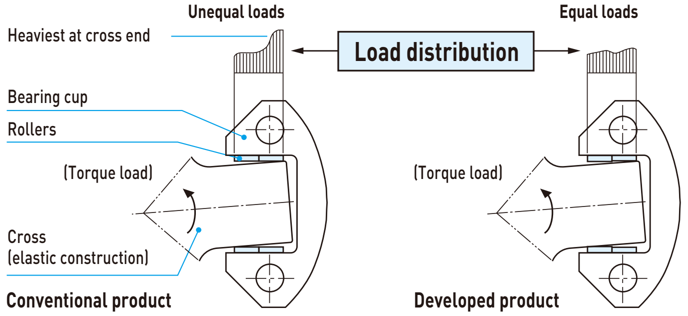
The block-type configuration is part of the D/U/T Series; the products of which are the strongest and have the longest service life in the JTEKT line-up. It is used in rolling mills such as Plate mill, Blooming mill and Hot strip mills (roughing/finishing) where conditions are extremely harsh.

🟪🟩 Contributing to stronger, longer-life drive shafts

① Application of different diameter rollers for cross & bearing

Features Roller diameter at the end of the cross reduced slightly
➡ Uniform multi-row roller load

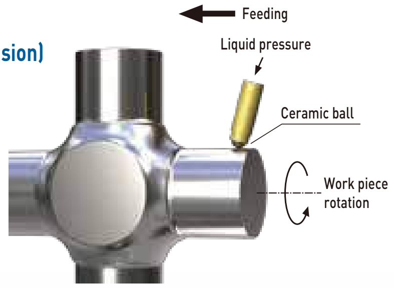
[Longer service life]

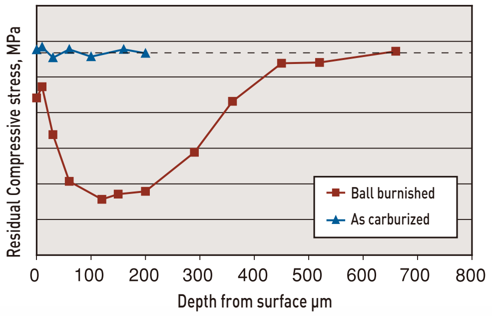


② Ball burnishing on cross shaft

Features
- Increasing of residual compressive stress at subsurface
- Increasing of surface hardness
- Fine surface roughness (Removal protrusion)

[Longer service life]

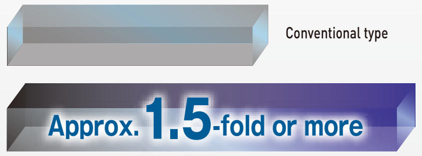


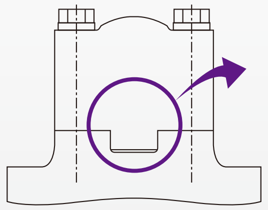


③ Thermal spraying coat of tungsten carbide (WC) on bearing cup key

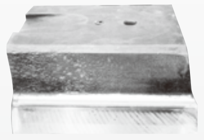
Features Restraining of clearance between key and key way due to corrosion wear
➡ Alleviating bending stress of bolt ··· Restraint of Strength reduction
➡ Minimizing heavy load at cross end ··· Longer service life

[Improved corrosion resistance]



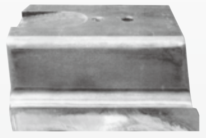


13 months



Without WC coat (corrosion)

20 months

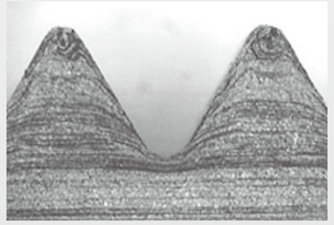


WC coated product (no corrosion)

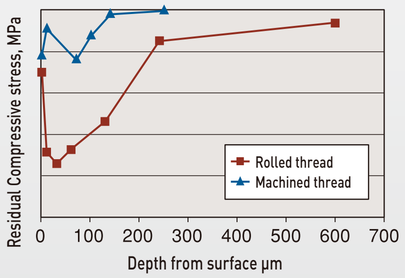
④ Application of form rolling to bearing set Bolt

Features
- Thread section processing changed from machining to form after heat treatment
- Fiber flow is formed along the shape of the thread
- Residual compressive stress at subsurface beneath the bottom radius of the thread increases

[Improved fatigue strength]



【 Fiber flow of rolled thread 】

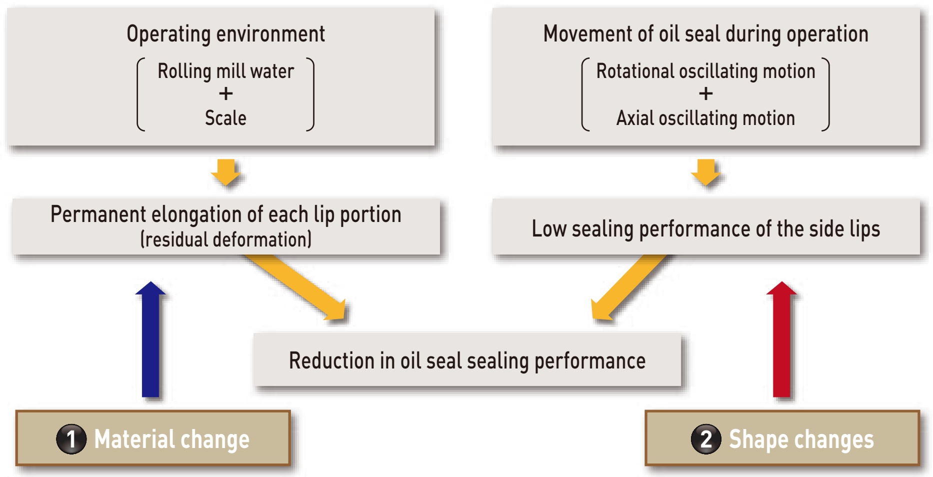


【 Residual compressive stress distribution of rolled thread 】

For more information, please refer to catalog No. B2021E.

Improved service life of oil seals and cross bearings

5 Development of a high-sealing oil seal



Operating environment
Rolling mill water
+
Scale

Movement of oil seal during operation
Rotational oscillating motion
+
Axial oscillating motion

Permanent elongation of each lip portion
(residual deformation)

Low sealing performance of the side lips

Reduction in oil seal sealing performance

❶ Material change

❷ Shape changes

Features

❶ **Improved sealing performance through material change**

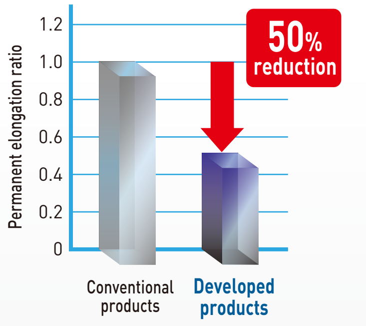
- Reduction of permanent elongation under rolling mill water and high temperature (90°C) environment by 50% compared to conventional

❷ **Improved sealing performance through shape change**

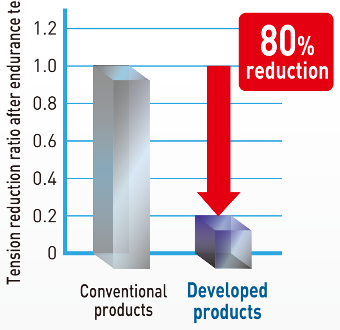
- By changing from side lip seal thrust contact to radial contact, sealing performance relative to axial oscillating motion has improved
- Reduced decline in lip tension by 80% compared to conventional

These changes suppress sudden damage to the cross bearing caused by deterioration in lubricating ability, thus contributing to reduced maintenance costs and improved productivity for customers.

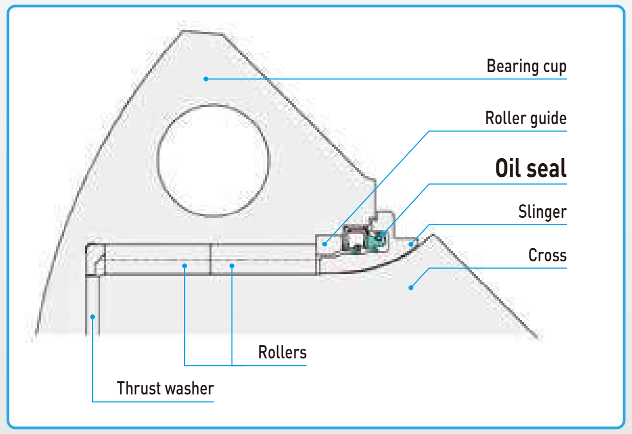
❶ [Confirmation of permanent elongation]



❷ [Confirmation of lip tension]



Conventional product: NBR (nitrile rubber)
Developed product: NBR (high nitrile rubber)



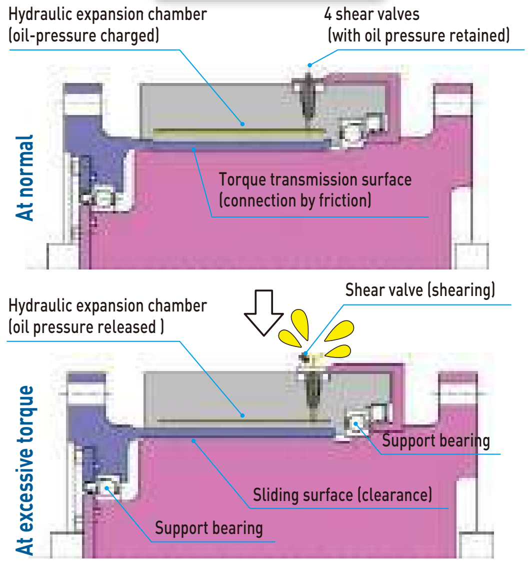
Optional mechanisms supporting drive shafts for rolling mill

Hyper coupling (torque limiter)

Features

- Device for protecting rolling mill drive system from excessive torque
- Significantly improved operating precision and durability
- Easy to set operating torque
- Significant reduced recovery time after finishing operation

Operating principle



Recovery work process (required time: 30min)

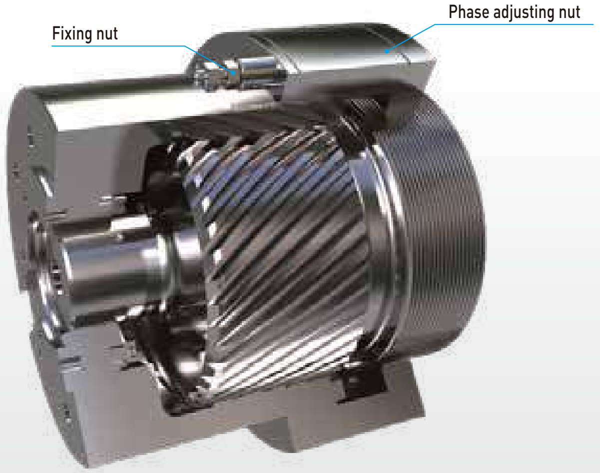
1. Phase alignment
2. Shear valve replacement (x4)
3. Re-pressurizing hydraulic expansion chamber

Optional mechanisms supporting drive shafts for rolling mill

Roll phase adjustment device (for bar & rod mill)

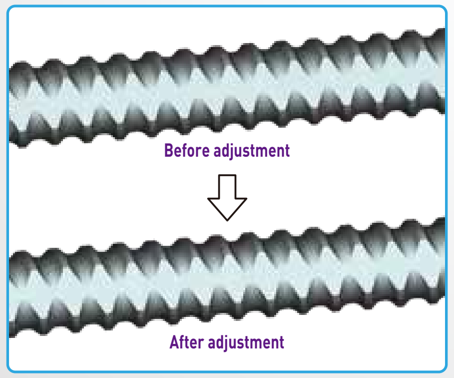
Features

- Device enables the rotational phase of rolls to be randomly adjusted when producing screw reinforcing bar and deformed steel bar used for construction.
- Phase can be adjusted almost seamlessly in a short time, improving product accuracy.
- Operation being possible without dismounting the drive shafts.



Product example

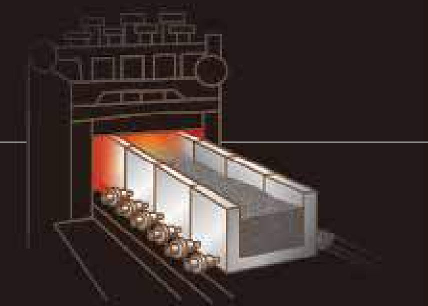
Screw reinforcing bar



Adjustment work process (online work)

1. Measure misalignment of workpiece
2. Set adjustment angle
3. Loosen the fixing nut
4. Turn the adjusting nut the required amount
5. Tighten the fixing nut

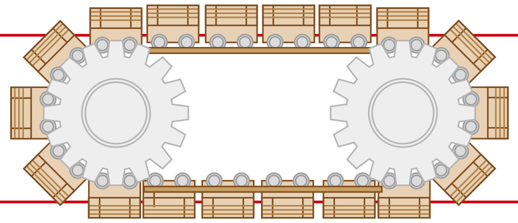
Bearings for sintering machine pallet car



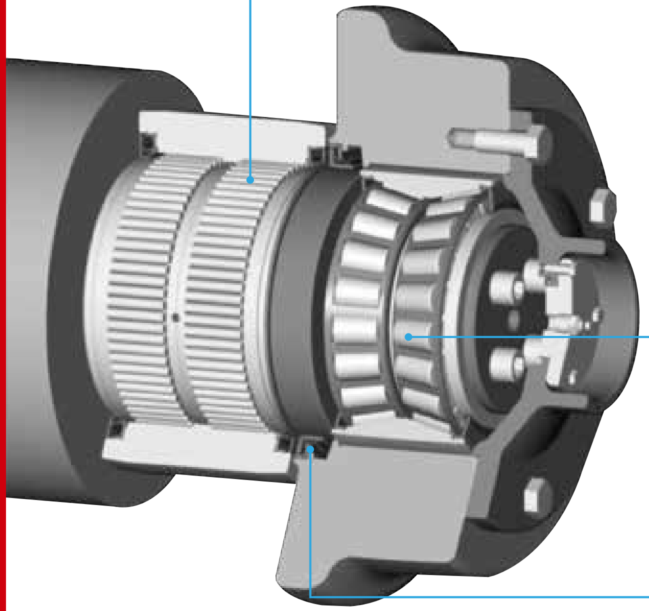
Sintering machines are used in harsh environments where high temperatures and large amounts of dust are generated. We provide sealed bearings and mill-scale seals capable of withstanding these kinds of environments.

Required performance and issues

- 🟥 Measures for heavy load / shock load
- 🟦 Preventing intrusion of dust



JHS JTEKT HYPER STRONG



Pressure roller bearings
(sealed type double row cylindrical roller bearings)

Features

Optimized outer ring thickness and carburized steel adopted
➡ Capable of withstanding heavy loads/impact loads

Sealing structure using special seal
➡ Prevents the intrusion of dust

Full roller shape adopted
➡ High load capacity realized

Wheel bearings
(sealed type double row tapered roller bearings)

Features

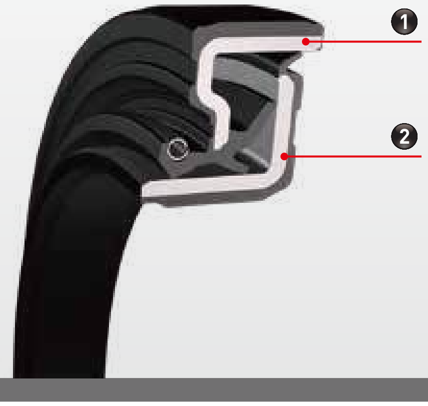
Integrated seal structure offers both high load capacity and excellent sealing performance
➡ Can withstand heavy loads and prevents the intrusion of dust

Intermediate seal

Features

Structure combining two parts (❶ and ❷)
➡ No damage to peripheral parts

High sealing performance owing to multilayer lip structure
➡ Prevents the intrusion of dust



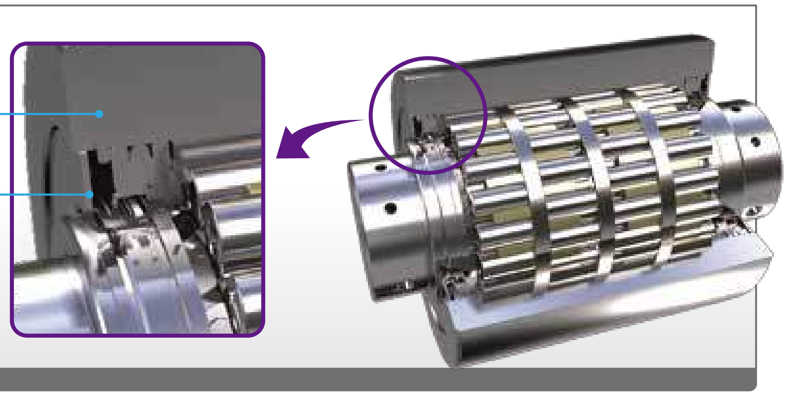
Bearing units for plate levelers

We provide plate leveler units to cope with severe usage environments such as heavy loads, rust and the intrusion of water / foreign matter.

Required performance and issues

🟥 Stable operation under heavy load 🟦 High corrosion resistance 🟩 Prevent the intrusion of water / foreign matter

- 🟥 Roll strength and bearing load rating improved as the result of integrating the roll and outer ring structure
- 🟦 Special stainless steel for rolls developed
- 🟩 Seal and shield are combined to form a labyrinth structure that has excellent sealing performance



Bearing units for tension levelers

We provide optimal tension leveler units that are compatible for high-speed rotation, wet / dry environments and low torque.

Required performance and issues

🟥 Low torque 🟩 Tightly sealed structure 🟦 High section height accuracy

- 🟥🟩 Wet-specification unit has an oil seal that forms a tightly sealed structure and also realizes lower torque
- 🟥 Dry-specification unit has a labyrinth seal structure that realizes the lowest possible torque
- 🟦 Addition of a suitable, uniform corrective force by controlling bearing section height (H) dimensional accuracy

Large Size Bearing Technology Development Center

JTEKT's accumulated knowledge and experience helps our customers solve problems. We provide new, high- value-added products and processes for businesses with a global supply system developed to meet those demands.

Regarding large bearings used in the industrial machinery field, there have been many cases in the past where customers evaluate by using actual machines after conducting desk review and basic evaluation. As a result, development took too long due to unforeseen problems that arose.

At the Large Size Bearing Technology Development Center which was established and launched operations, evaluation tests in environments close to actual machines are now possible within JTEKT. The accumulated data will be used to raise the accuracy of CAE analysis (simulation analysis) which will result in significant reduction of the product developmental period as well as the development of new, high-value-added products.

Bearing testing equipment for steel production equipment

Our testing equipment is able to evaluate the scattering rolling mill water in high-temperature environments to recreate close to actual conditions.

In this way, we can deliver bearings and oil seal components with excellent performance.

Oil Seal Lineup for Steel Production Equipment

Only One ***Partner***

Steel production equipment operates in high-temperature environments where a large amount of water is used.
In order to secure the stable operation of steel production equipment, JTEKT produces optimal oil seals that contribute to ensuring a favorable working environment where the equipment demonstrate its true potential.
We offer a complete range of sealing technology services, including oil seals and surrounding structures such as bearings, drive shafts and other key components.

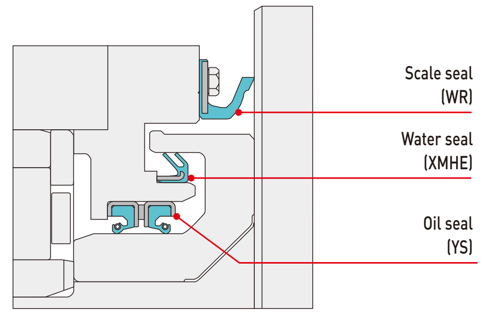
Oil Seals for Rolling Mill Roll Necks

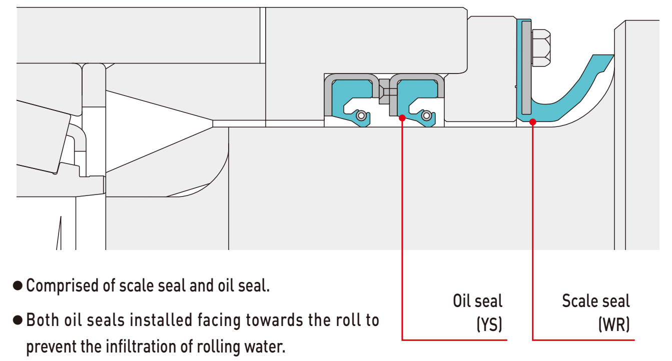
Examples of Oil Seal Applications

Cold Rolling Mill Backup Rolls

- The WR seal is often used as a scale seal owing to it featuring a side lip that gives it superior ability to shake off rolling water.
- Oil seals are attached back-to-back and play an important role in preventing bearing oil leaks.



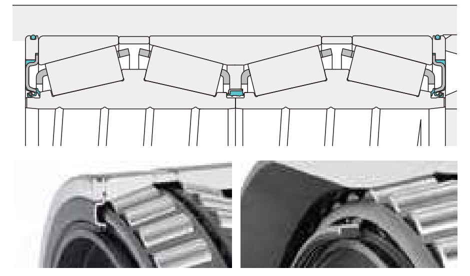
Rolling Mill Work Rolls

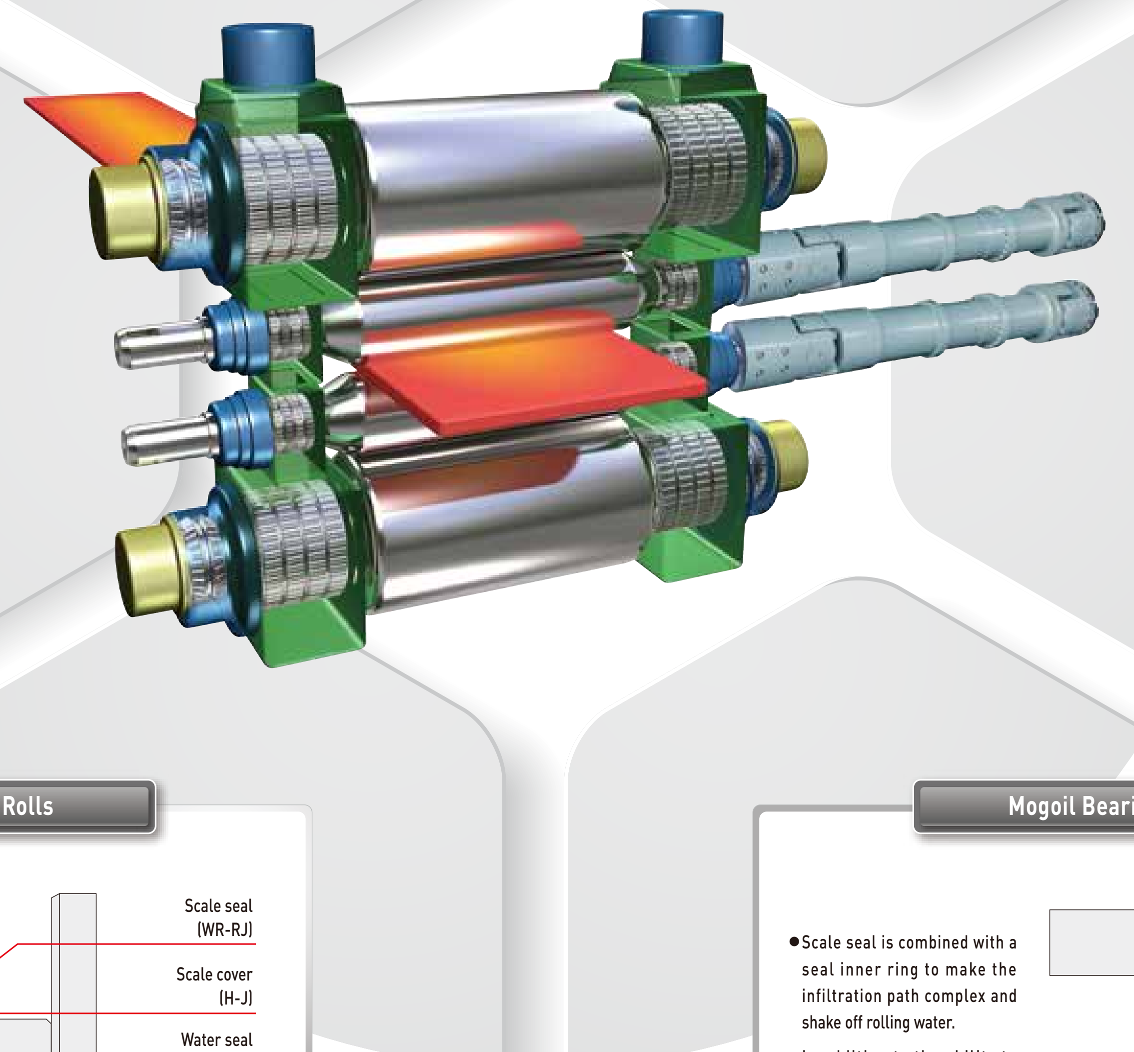


- Comprised of scale seal and oil seal.
- Both oil seals installed facing towards the roll to prevent the infiltration of rolling water.

■Sealed type four -row tapered roller bearings

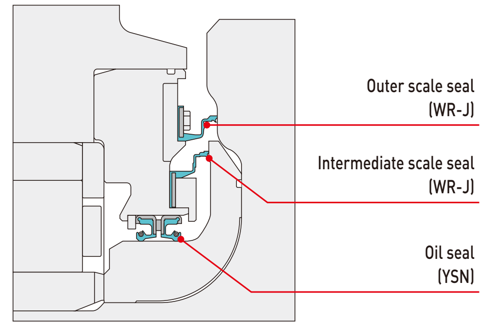
- Holds grease in the bearing and prevents the infiltration of rolling water and scale from outside.





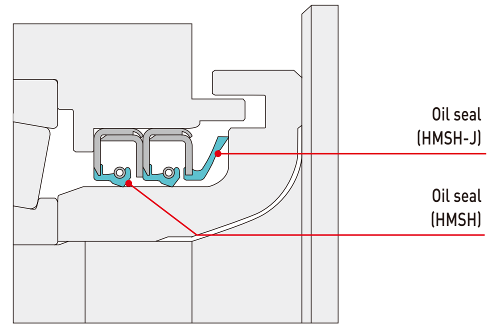
High-speed Cold Rolling Mill Backup Rolls

- If the roll rotation speed exceeds 1,800min^{-1}, the durability of the scale seal is improved thanks to its low heat generation specification.
- Infiltration of rolling water is prevented by using two scale seals.
- Oil seals for low-heat generating specifications.



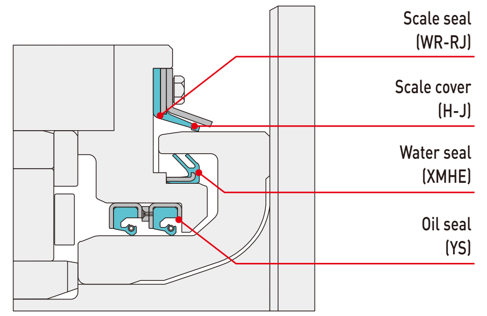
Shaped-steel Rolling Mill

- A HMSH-J oil seal with scale seal function added is used on the roll side to prevent the infiltration of scale.



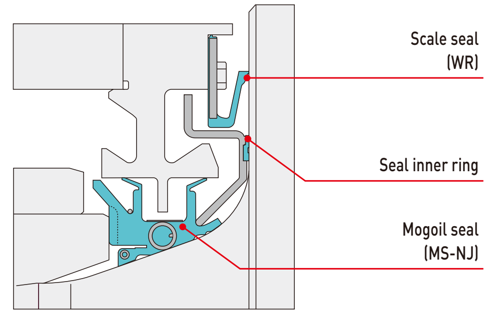
Hot Rolling Mill Backup Rolls

- The WR-RJ scale seal with a radial lip for superior following of axial displacement and the H-J scale cover can also be used.
- Two oil seals installed facing towards the roll play an important part in preventing water infiltration.



Mogoil Bearing (Slide Bearing)

- Scale seal is combined with a seal inner ring to make the infiltration path complex and shake off rolling water.
- In addition to the ability to shake off water, the Mogoil seal increases sealability using a seal lip.



Features of Each Oil Seal

Category	Scale Seal			
Type	WR	WR-RJ + H-J	WR-J	WR-BJ
Shape				Features	● Standard scale seal product ● Side lip has superior ability to prevent rolling water/scale infiltration	● Used when there is frequent movement in the axial direction ● Scale cover (H-J) is used if rolling water come in direct contact with the seal	● Low torque specifications ● Appropriate for high-speed cold rolling, dry milling and other specifications where heat generation and lubrication are difficult	● Used if there is no space to install in the radial direction ● Tightened and secured with a steel band

Category	Oil Seal				
Type	YS	YSA	YS-J	YS-P	YSN
Shape					Features	● Standard oil seal product Superior installation ability owing to use of robust steel band ● Spring less likely to come out as rubber covers more than 75% of the bearing	● YS oil seal with an additional auxiliary lip to prevent the infiltration of dust	● YS oil seal with scale seal modification added for when there is insufficient space to install a scale seal	● YS with pressure-resistant specification ● Additional backup ring on the lip prevents lip from turning due to pressure, reduces lip temperature by providing support	● Often used for low-torque YS specifications but can be used with general specifications

Category	Oil Seal				Water Seal	V ring
Type	MS	MSA	HMSH	HMSH-J	XMHE	MV-A
Shape						Features	● Easy-to-install oil seal comprised of rubber and hook-type spring ● If shaft cannot be removed, a one cut-type oil seal (MS-C) is used	● MS oil seal with an auxiliary lip added to prevent the infiltration of dust	● Small-diameter oil seal (outer diameter 300mm or less)	● HMSH oil seal with scale seal modification added for when there is insufficient space to install a scale seal	● Seal lip is installed facing outward, with the two spaces functioning as a conduit to direct rolling water from the top to the bottom and prevent infiltration of rolling water and scale	● A seal made of only rubber stretched and attached to the shaft ● Used as an alternative to a scale seal

Category	Mogoil Seal		Block Mill Seal	
Type	MS-J	MS-NJ	M-BNJ	WR-J
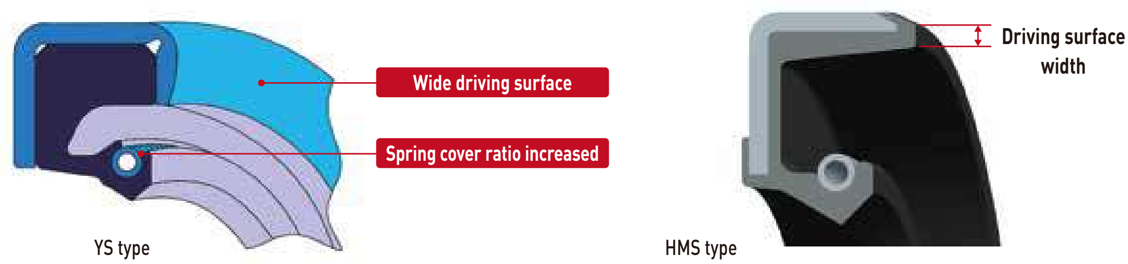
Shape				Features	● Standard Mogoil seal product ● East-to-install seal that prevents the infiltration of oil and water ● Rotates due to being secured to the roll neck, and therefore has superior shake off performance	● Lip contact is stable owing to the different shapes of the lip and end-plate, thereby achieving superior sealability performance compared to the MS-J	● Standard block mill seal product ● Prevents infiltration of oil and water at ultrahigh-speed rotation of 100 m/s	● Improved product durability with superior detachability ● Uses two seals, one each for oil and water, for tough specification conditions, with seal on water side only easy to replace

Oil Seal (YS) Features

Features

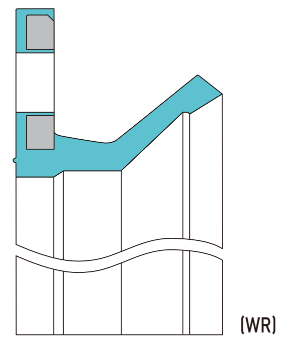
- Wider driving surface when assembling seal on the choke prevents seal distortion, and steel band made of enhanced high-strength material is used
- Spring cover ratio increased to prevent spring from coming off when inserting into roll



Scale Seal (WR & WR-J) Features

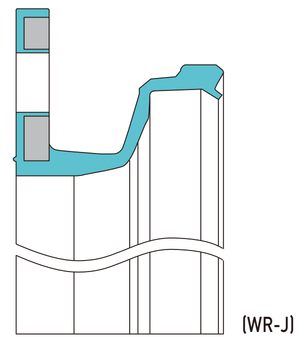
(Standard products)

- Used in locations exposed to large volumes of water, such as hot rolling mills, owing to superior ability to prevent water and scale infiltration

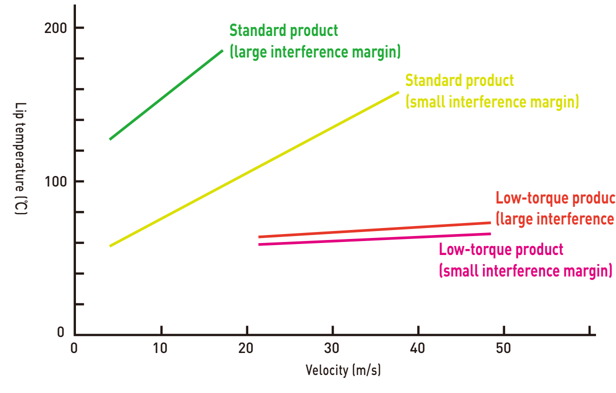


(Low-torque products)

- Used for high-speed cold rolling owing to the ability to suppress rising lip temperature



- Lip temperature on actual machine measured and reflected in design



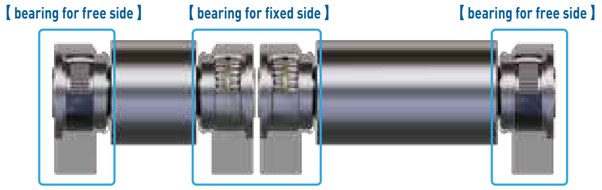
Velocity and lip temperature (bench test)

Oil Seals for Continuous Casting Machines

Types of Rolls

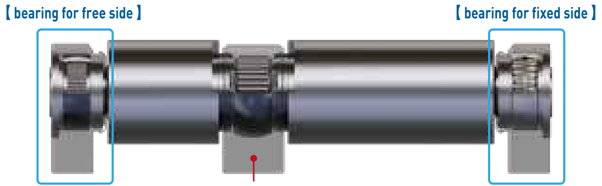
Roll configuration example 1 (single and split rolls)

Optimal configuration for roll elongation absorption using single and split rolls



Roll configuration example 2 (pestle-shaped roll)

Optimal configuration for roll elongation absorption using pestle-shaped roll



(See next page for oil seal for split bearing units)

Oil Seals for Free Side/Fixed Side Bearing Housing Units

Features

- Bumper lip shape for main lip alleviates shaft wear
- Protective lip suppresses water/scale infiltration
- Hydrogenated nitrile rubber (HNBR) used as standard rubber material, featuring superior heat resistance that ensures more stable use when exposed to water vapor

■ Discharge and recovery methods for bearing house grease and oil/air

		End side	Roll side	
		ME type	MD type	GK type
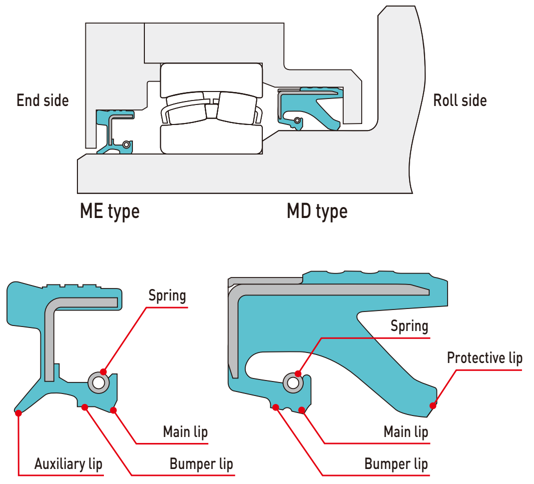
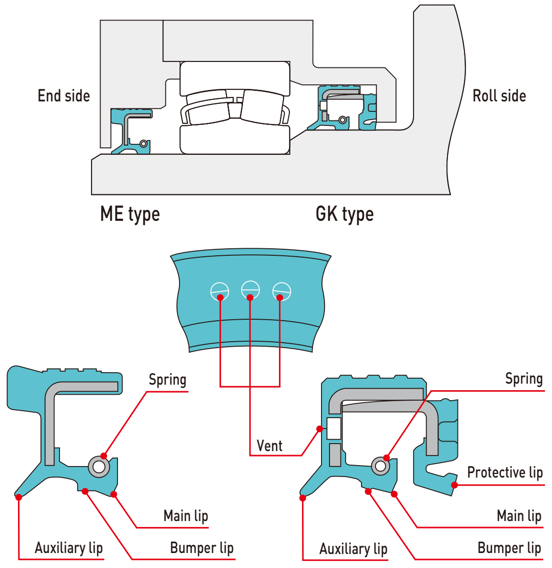
Shape				Characteristic		Standard end-side product	Improved sealability with protective lip	Vent for improved lubrication and suppressing wear on shaft and lip
Grease	Discharge method	○	○	—
	Recovery method	○	—	○
Oil/Air	Discharge method	○	○	—
	Recovery method	○	○	—

Bearing Housing Grease discharge method
Oil/Air discharge method
Oil/Air recovery method



Bearing Housing Grease recovery method

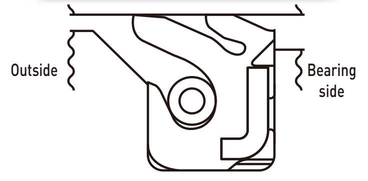


Oil Seals for Split Bearing Units

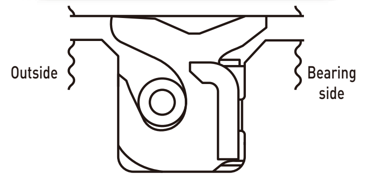
Features

- Follow roll deflection
- Suppress water and scale infiltration
- Hold grease between lips

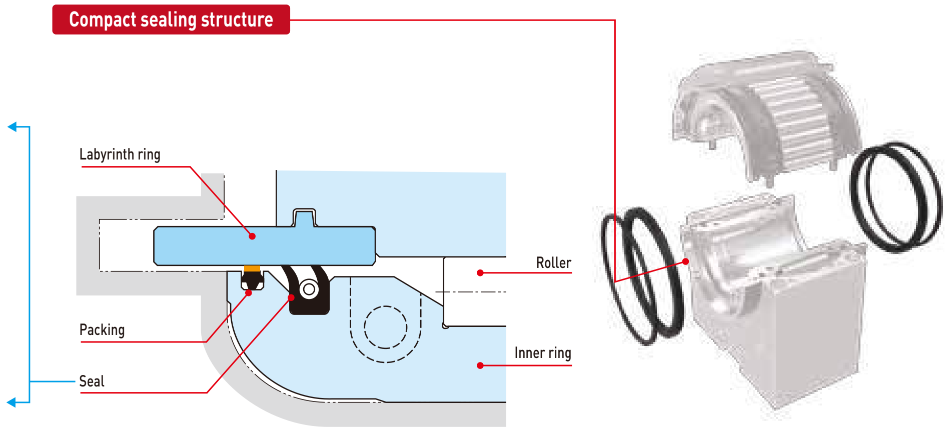
Grease discharge method



Grease Recovery Method



Please consult with JTEKT regarding oil seals for oil/air lubrication.



Oil Seal Rubber Material Used for Continuous Casting Machines

Features

- Compared to fluoro rubber (FKM), hydrogenated nitrile rubber (HNBR) has superior water vapor resistance and grease resistance (urea-based), thereby providing better performance than FKM in cases of continuous use.

■ Rubber material resistance comparison

	Hydrogenated nitrile rubber (HNBR)	Fluoro rubber (FKM)	Nitrile butadiene rubber (NBR)
Heat resistance	○	○	△
Urea grease resistance	○	△	○
Water vapor resistance	○	×	△
Water resistance	○	○	○
Wear resistance	○	○	○

○:Has resistance (excluding specific cases) △:No resistance (excluding specific cases) ×:No resistance

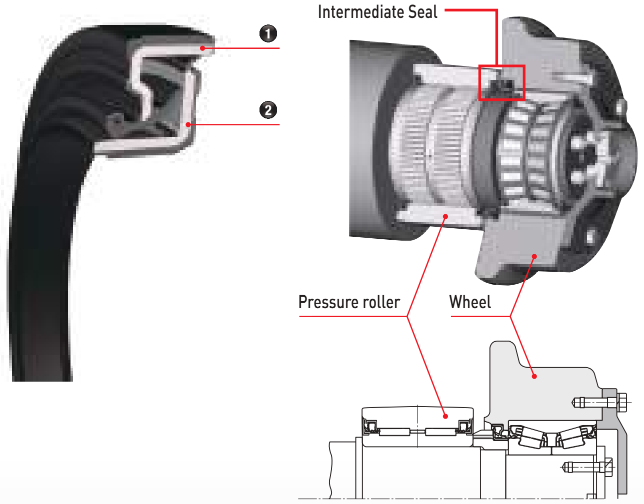
Note: Judgment of heat resistance and water vapor resistance assumed a working condition of 100℃

Oil Seals for Sintering Machine Pallet Cars

Intermediate seal

Features

- No damage to peripheral parts owing to two-component (❶and❷) combined structure
- Prevents dust infiltration owing to high sealing performance provided by multilayer lip structure



Sealed Bearing Seals

Bearing seal for pressure rollers

●Special seal shape with integrated sleeve prevents dust infiltration

Bearing seals for wheels

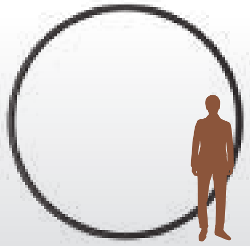
●Compact seal shape with improved sealing performance prevents dust infiltration

Oil Seals for Converter Furnaces

Large Seals

Features

- MS-type oil seals can be cut in one location to enable easy installation on long or complex-shaped shafts



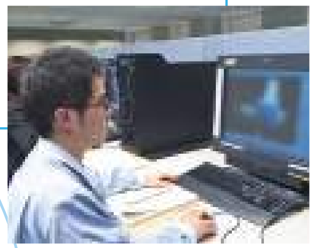
Converter trunnion split bearing

MS-type oil seal cut in one location

Technology Management

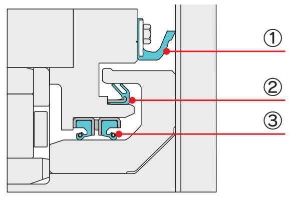
Oil seal FEM analysis

Scale seal FEM analysis



Analysis example

Basic design concept



① Scale seal
…Prevents infiltration of/shakes off cooling water

② Water seal
…Prevents infiltration of cooling water

③ Oil seal
…Prevents leakage of bearing lubricant

Example rolling bearing sealers for backup rolls

- Optimal rubber composition as sealing material
- Well-balanced design adaptable to location of use

Material Design Analysis

Technology Management

Production Inspection

- Stable quality by vacuum vulcanization molding
- Integrated production of seals including rubber and metal ring

Large turning machine

Inspection data CPU

Evaluation

- Evaluation can be performed in a simulated environment closely resembling actual machine operation

Bearing tester
for steel production equipment

World’s first successful practical application of ceramic bearings

“Aren’t there any bearings that can be used in seawater?”

…One of our customers asked this question,
triggering our efforts to develop the ceramic bearing.

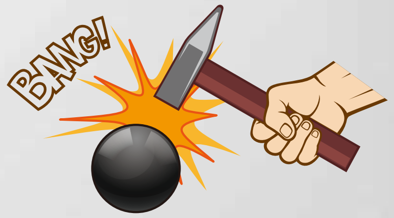
Initially, we attempted to use alumina as the raw material,
but **it split quickly and cracks developed…**

Following this, research stalled and ended after approximately five years.

Research resumed again in 1978;
this time with the development team consisting of five members.

Additionally, **a material manufacturer known for leading ceramics research was invited to join the effort.**

Starting with silicon nitride as the raw material,
strength was reinforced using a sintering additive and
a hot pressing process eliminated cracking.
As a result, the first ceramic bearings were commercialized in 1984.



Some of our customers had doubts about strength in the beginning,
stating “If ceramic cracks, it will surely split in two!”

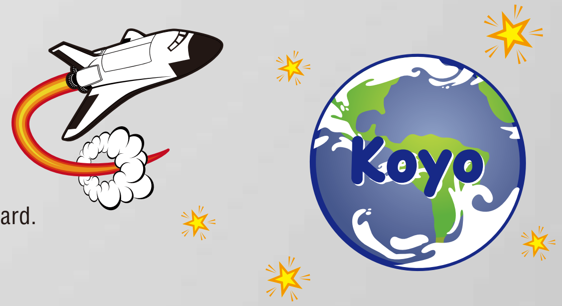
At that time, **customers would hit the bearings with a hammer to test their strength.**

Doing this, **the concrete below the bearing was the only thing that cracked!**

Finding practical applications was initially difficult,
but **their strength and high-speed performance were gradually recognized,** and
ceramic bearings began to be utilized for the main spindles of machine tools.

Next, **they began receiving attention from semiconductor manufacturers owing to the characteristics of not using oil and not producing waste.**

Ceramic bearings were then **utilized in a section of experimental equipment on the space shuttle Colombia,** expanding their range of applications.



As productivity improved, ceramic bearings began being used in the
mass production of computer HDDs and automobile engines.

Their excellent performance has been recognized and
applications have received various awards, such as the Japan Fine Ceramics Award.

And now…

“For ceramic bearings, the answer is KOYO”

Introduction to Application Examples

Performance

Ceramic Bearing Capacities

Product Introduction

1 Machine tools

CERAMIC BEARINGS

1 Spindle (Angular Contact Ball Bearing)

Product : Hybrid Ceramic Bearings

Machine tool spindle bearings are required to have superior rotational performance at extremely high speeds, quick acceleration/ deceleration, high rigidity, and reduced temperature rises.
Hybrid Ceramic Bearings, which satisfy these requirements, are widely used in this application.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- 20% to 30% reduction in temperature rise
- Upper limit of rotational speed range is 1.2-1.5 times higher (compared to Koyo steel bearings)

Use Conditions

Rotational speed: 25 000 min^{-1}
($d_m n = 2.75 \times 10^6$)
Lubrication: Oil or Grease
Spindle power: 75 kW

High Ability

2 Spindle (Cylindrical Roller Bearing)

Product : Hybrid Ceramic Bearings

Seizure resistance performance under unbalanced load conditions due to misalignment improved at the Vertical Spindle Machining Center.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- 20% to 30% reduction in temperature rise
- Upper limit of rotational speed range is 1.2-1.5 times higher (compared to Koyo steel bearings)

Use Conditions

Rotational speed: 12 000 min^{-1}
Lubrication: Grease

High Ability

2 Film manufacturing equipment

CERAMIC BEARINGS

1 Liquid Crystal Polarizing Film Manufacturing Equipment

Product : Corrosion Resistant Hybrid Ceramic Bearings

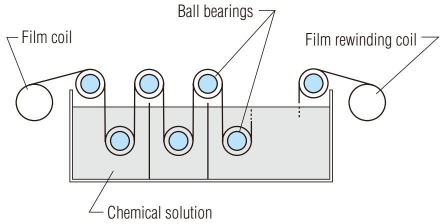
Liquid crystal polarizing film manufacturing equipment use acid solution, alkaline solution, dying solution, distilled water, and other solutions.
In such corrosive environments, Corrosion Resistant Hybrid Ceramic Bearings are widely used.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
High speed	**Abrasion resistance**	Low torque

- Corrosion resistance to solutions such as acid solution, alkaline solution, dying solution, and distilled water

Use Conditions

Rotational speed: 80 min^{-1}
Temperature: Room temp. to 80°C
Lubrication: Chemical solution



2 Photographic Film Manufacturing Equipment

Product: Hybrid Ceramic Bearings (with special features)

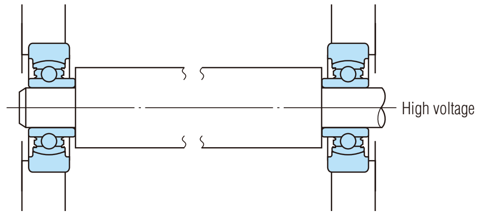
A photographic film production line treats film surfaces by applying a high voltage.
Hybrid Ceramic Bearings are widely used in such environments, because the ceramic inner ring and balls serve as insulators.

Vacuum	Clean	High temperature
Corrosive	**Electric field**	Magnetic field
High speed	Abrasion resistance	Low torque

- Insulation under high voltage environments

Use Conditions

Rotational speed: 200 min^{-1}
Temperature: Room temp.
Lubrication: Grease



3 Power generation equipment

CERAMIC BEARINGS

1 Wind Turbine Generator

Product: Hybrid Ceramic Bearings

Wind Turbine Generator are strongly required to operate for extensive periods of time without the need of maintenance.
However, bearings used in generators are subject to electrical pitting, which may cause the bearings to break down.
Hybrid Ceramic Bearings, which have superior durability and reliability, are widely used in such aerogenerators.

Vacuum	Clean	High temperature
Corrosive	**Electric field**	Magnetic field
High speed	Abrasion resistance	Low torque

- Prevention of electrical pitting
- Extension of grease service life (three times longer than Koyo steel bearings)

Use Conditions

Rotational speed: 2700 min^{-1}
Temperature: Below freezing point to approx. 60°C
Lubrication: Grease

2 Micro Gas Turbine Generator

Product: Hybrid Ceramic Bearings

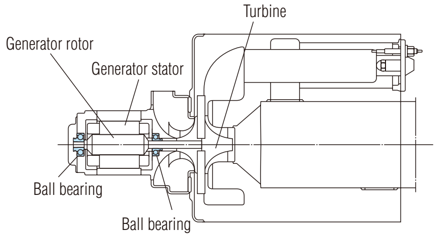
The world's smallest gas turbine generators emit clean exhaust emissions and hence are friendly to the environment.
Hybrid Ceramic Bearings are used in these generators because they are low in vibration and noise generation, and have excellent high speed performance.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- Improved reliability in high speed rotation

Use Conditions

Rotational speed: 10 000 min^{-1}
($d_m n = 2.22 \times 10^5$)
Temperature: 200°C
Lubrication: Oil



4 Industrial furnaces

CERAMIC BEARINGS

1 Liquid Crystal Panel Bonding and LC Sealing Furnace

Product : Hybrid Ceramic Linear Motion Ball Bearings

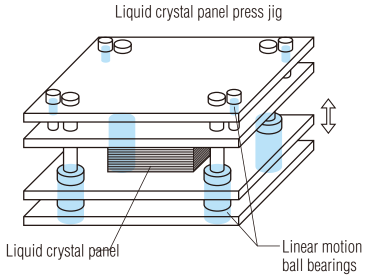
Substrate bonding press jigs for use in furnaces must be low in particle emissions and have a long service life under high temperature conditions.
The Clean Pro Hybrid Ceramic Linear Motion Ball Bearings are widely used for such jigs.

Vacuum	**Clean**	**High temperature**
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- Suitable for clean environments thanks to low particle emissions

Use Conditions

Stroke speed: 5 mm/s
Temperature: 200°C
Ambient pressure: Normal pressure
Lubrication: Clean pro coating



2 Furnaces Cars

Product: High Temperature Hybrid Ceramic Bearings

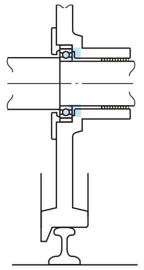
The bogies, conveyers and other carrier systems used in furnaces are exposed to high temperatures.
Because of their high heat resistance, High Temperature Hybrid Ceramic Bearings are used in such applications.

Vacuum	Clean	**High temperature**
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- Applicable to high temperature environments

Use Conditions

Rotational speed: 10 to 500 min^{-1}
Temperature: 500°C
Lubrication: Graphite



3 Baking Furnace Cars

Product: High Temperature Hybrid Ceramic Bearings

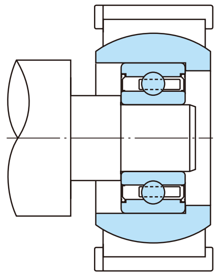
In the kiln that bakes fluorine resin onto the heat rollers of copying machines, conveyor bearings must be low in particle emissions under high temperatures. Because it is structurally difficult to mount bearings accurately, High temperature Hybrid Ceramic Bearings are used for this application, along with aligning rings.

Vacuum	Clean	**High temperature**
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- Compatible with high temperature environments

Use Conditions

Rotational speed: 3 to 10 min^{-1}
Temperature: 400 to 500°C
Lubrication: Graphite



4 Tube Annealing Furnace Guide Rolls

Product: Hybrid Ceramic Bearings

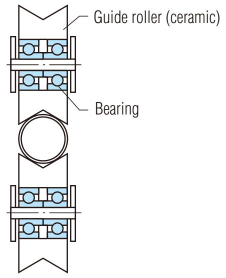
The guide roll bearings installed inside tube annealing furnaces are used under high temperatures without lubrication.
Hybrid Ceramic Bearings are suitable for such applications.

Vacuum	Clean	**High temperature**
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- Compatible with high temperature environments

Use Conditions

Rotational speed: 300 min^{-1}
Temperature: 300°C



5 Diffusion Furnace Dolly

Product: Full-complement Ceramic Ball Bearings

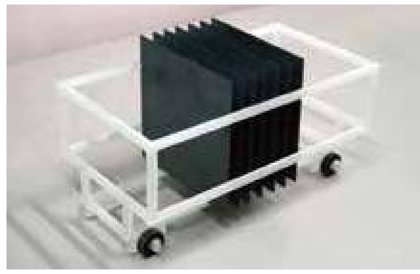
Conditions in a diffusion furnace are harsh, including not only high temperature, but also corrosive gas.
Incorporating a rolling mechanism for the conveyor dolly in the furnace enables smooth conveyance to be obtained, thereby leading to improvements in product quality and productivity.

Vacuum	Clean	**High temperature**
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- Compatible with high-temperature environments
- Corrosion-resistant against corrosive gases
- Contributes to improved productivity

Use Conditions

Temperature: 800°C or higher
Ambient pressure: Corrosive gas atmosphere
Load: 5N



5 Production equipment

CERAMIC BEARINGS

1 Aluminum Electrolytic Capacitor Manufacturing Equipment

Product: High Corrosion Resistant Ceramic Bearings

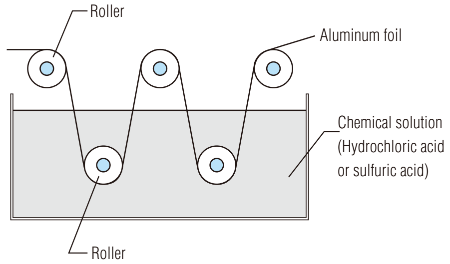
In an aluminum foil electrolytic capacitor manufacturing equipment, a strong acid solution is used to treat the aluminum foils. High Corrosion Resistant Ceramic Bearings are widely used in such highly corrosive environments.

Vacuum	Clean	High temperature
[✓ Corrosive]	Electric field	Magnetic field
High speed	[✓ Abrasion resistance]	Low torque

- Corrosion resistance to strong acid solution

Use Conditions

Rotational speed: 50 min⁻¹
Temperature: 90°C
Lubrication: Chemical solution
(hydrochloric acid and sulfuric acid)



2 Synthetic Fiber Manufacturing Equipment

Product: Corrosion Resistant Hybrid Ceramic Bearings

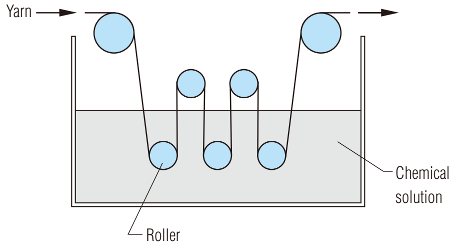
Acid solution, alkaline solution, water, and other liquids are used in synthetic fiber yarn reinforcing processes. Corrosion Resistant Hybrid Ceramic Bearings are applied in such corrosive environments.

Vacuum	Clean	High temperature
[✓ Corrosive]	Electric field	Magnetic field
High speed	[✓ Abrasion resistance]	Low torque

- Corrosion resistance under acid solution, alkaline solution and water

Use Conditions

Rotational speed: 20 to 100 min⁻¹
Temperature: Room temp. to 90°C
Lubrication: Chemical solution



3 DVD Sputtering Equipment

Product: Hybrid Ceramic Bearings

To improve reliability further, Hybrid Ceramic Bearings are used.

Vacuum	Clean	High temperature
Corrosive	[✓ Electric field]	Magnetic field
High speed	Abrasion resistance	Low torque

- Insulation

Use Conditions

Rotational speed: 300 min⁻¹
Temperature: Room temp.
Lubrication: Grease

4 Steel Wire Stranding Machine

Product: Hybrid Ceramic Bearings

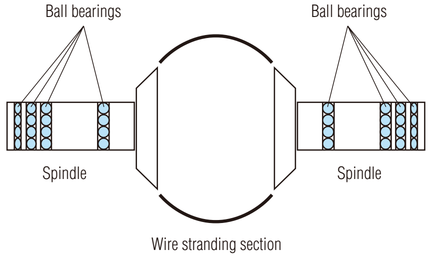
Steel wires for radial tires are produced by stranding steel wires to attain the required strength. In steel wire stranding machines, which involve high speed rotation, Hybrid Ceramic Bearings are used for improved service life and stability.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
[✓ High speed]	Abrasion resistance	Low torque

- Reduced temperature rises
- Reliable durability

Use Conditions

Rotational speed: 6 000 min⁻¹ or higher
Lubrication: Grease



5 Jet Electrostatic Coating Machine

Product: Hybrid Ceramic Bearings

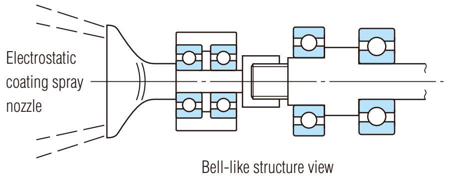
In a jet electrostatic coating machine, grease may escape from the spray nozzle due to the air motor, affecting the quality of the paint to be coated.
To resolve this problem, Hybrid Ceramic Bearings that do not use grease are used.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
[✓ High speed]	Abrasion resistance	Low torque

- Prevention of grease scattering
- Prevention of paint contamination

Use Conditions

Rotational speed: 20 000 min⁻¹
Lubrication: Fluorine polyme



6 Blister Packaging Equipment

Product: High-temperature Hybrid Ceramic Bearings

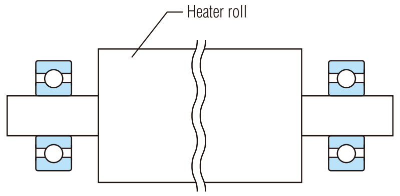
As heater roll bearings used in processing reach high temperatures during operation, conventional bearings are quickly damaged.
Incorporating high-temperature ceramic bearings extends the bearing replacement cycle and improves productivity.

Vacuum	Clean	[✓ High temperature]
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- Applicable to high-temperature environments
- Contributes to improved productivity

Use Conditions

Temperature: 250°C
Load: 900N
Lubrication: Grease



6 Semiconductor manufacturing equipment

1 Transfer Robot for Semiconductor and LCD Manufacturing Equipment

Product: K Series Full-Complement Hybrid Ceramic Ball Bearings

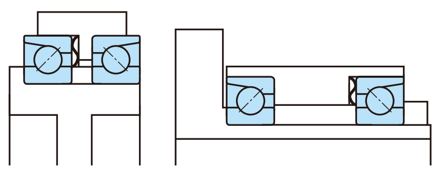
For application in transfer robots for semiconductor and liquid crystal manufacturing equipment, bearings are required to be low in particle emissions and have a long service life.
Bearings may be delivered incorporated in arm units for improved assemblability and maintainability.

Vacuum	**Clean**	**High temperature**
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	**Low torque**

- Applicable to vacuum environments and clean environments
- Optimal for machine size reduction

Use Conditions

Temperature: Room temp. to 200°C
Ambient pressure: 10^{-3} Pa
Lubrication: Grease or clean pro coating



Bearing unit for application to transfer robots

2 Electron Beam Lithography

Product: Non-magnetic Hybrid Ceramic Bearings

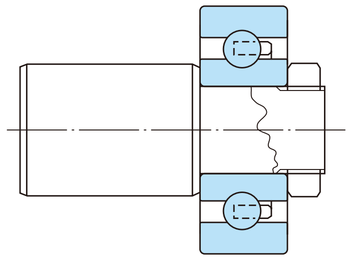
The bearings in semiconductor production electron beam lithography are exposed to strong magnetic fields.
Because of their non-magnetic characteristics, Hybrid Ceramic Bearings are used in such machines.

Vacuum	Clean	High temperature
Corrosive	Electric field	**Magnetic field**
High speed	Abrasion resistance	Low torque

- Compatible with vacuum, strong magnetic field environments

Use Conditions

Rotational speed: 100 min^{-1}
Temperature: Room temp.
Ambient pressure: 10^{-5} Pa
Lubrication: Grease



3 Gates in Chemical Vapor Deposition Equipment

Product: Hybrid Ceramic Ball Bearing Clean Pro Linear Motion Ball Bearings

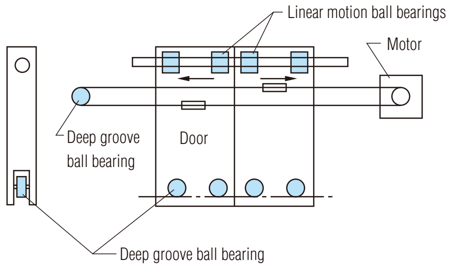
Hybrid Ceramic Ball Bearings and Clean Pro Linear Motion Ball Bearings are widely used for the doors of the chemical vapor deposition (CVD) equipment.

Vacuum	**Clean**	**High temperature**
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- Applicable to high temperature, vacuum and clean environments

Use Conditions

Rotational speed: 10 to 200 min^{-1}
Temperature: 200°C
Ambient pressure: Normal to 10^{-4} Pa
Lubrication: Clean pro coating



4 Etching Equipment

Product: Hybrid Ceramic Bearings (with special features)

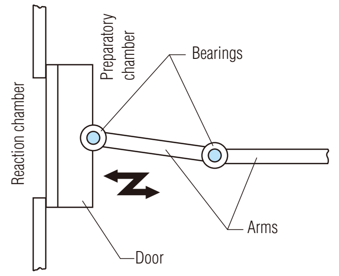
Bearings used in etching machines must be resistant to halogen, hydrofluoric acid, and other corrosive gasses, as well as low in particle emissions. To meet these requirements, PTFE coated Hybrid Ceramic Bearings are used.

Vacuum	**Clean**	**High temperature**
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- Resistant to corrosive ambient gases such as halogen and hydrofluoric acid
- Suitable for clean environments thanks to low particle emissions

Use Conditions

Temperature: Room temp. to 60°C
Ambient pressure: Normal to 10^{-2} Pa
Load: Radial load of 10 N
Lubrication: PTFE coating



5 Vacuum Evaporator

Product: High Temperature Hybrid Ceramic Bearings (with special features)

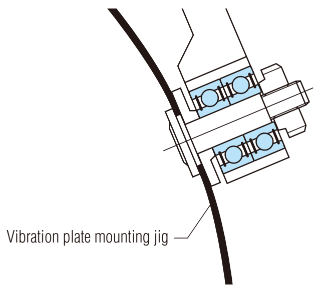
Bearings used in the planetary section of vacuum evaporator are required to be high in durability under high temperatures, high load (moment) conditions. To ensure a long bearing life under high temperature conditions, High temperature Hybrid Ceramic Bearings with special features are used.

Vacuum	Clean	**High temperature**
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- Improved reliability in vacuum and high temperature environments

Use Conditions

Rotational speed: 1 to 30 min^{-1}
Temperature: 200 to 400°C
Ambient pressure: 10^{-6} to 10^{-8} Pa
Lubrication: Molybdenum disulfide or silver



6 Spin-dryer for Wafer Cleaning Equipment

Product: Corrosion Resistant Hybrid Ceramic Bearings

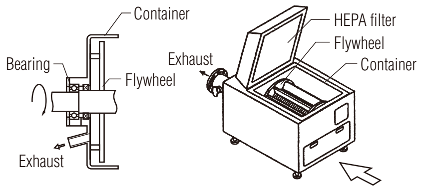
In semiconductor wafer cleaning processes, wafers are cleaned in cleansing chemicals, rinsing liquids, distilled water, and other liquids before drying.
Because of their high corrosion resistance, Corrosion Resistant Hybrid Ceramic Bearings are widely used in wafer cleaners.

Vacuum	**Clean**	High temperature
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	**Low torque**

- Corrosion resistance to solutions such as cleaning chemicals, rinsing liquids, and distilled water

Use Conditions

Rotational speed: 2 000 to 3 000 min^{-1}
Temperature: Room temp.
Lubrication: Grease



6 Semiconductor manufacturing equipment

CERAMIC BEARINGS

7 Wafer Transfer Equipment

Product: Hybrid Ceramic Linear Way Bearing Units (with special features)

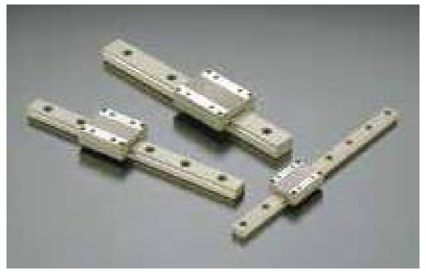
For application in wafer transfer equipment, low particle emissions performance is required.
For such devices, Clean Pro Hybrid Ceramic Linear Way Bearing Units are widely used.

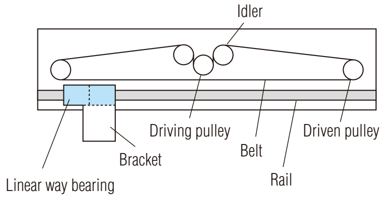
Vacuum	**Clean**	High temperature
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- Suitable for clean environments thanks to low particle emissions
- Corrosion resistant to cleaning agent splashes

Use Conditions

Stroke speed: 350 mm/s
Temperature: Room temp.
Ambient pressure: Normal pressure
Lubrication: Clean pro coating





8 Wafer Cleaning Equipment for Chemical Mechanical Polishing System

Product: Corrosion Resistant Ceramic Bearings

In the semiconductor multilayer production process, each wafer surface should be treated to maintain evenness. This process uses chemical mechanical polishing equipment, and the cleaner attached to the equipment uses Corrosion Resistant Ceramic Bearings.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
High speed	**Abrasion resistance**	Low torque

- Corrosion resistance to corrosive solutions

Use Conditions

Rotational speed: 100 min^{-1}
Temperature: Room temp.
Lubrication: Fluorine polymer

9 Turbo Molecular Pump

Product: Full-Complement Hybrid Ceramic Ball Bearings (with special features)

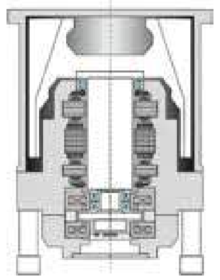
Magnetic bearings are used in turbo molecular pumps driven at extremely high speeds. To protect the blades from fracture in case of a power failure or magnetic failure, touchdown bearing units are used. As touchdown bearings, Full-Complement Hybrid Ceramic Ball Bearings are used to increase the service life of the touchdown bearings under severe hostile conditions.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
High speed	**Abrasion resistance**	Low torque

- Improved reliability in vacuum environments

Use Conditions

Rotational speed: 20 000 to 60 000 min^{-1}
Ambient pressure: 1 Pa
Lubrication: Molybdenum disulfide or silver



7 Motor, Industrial machinery

CERAMIC BEARINGS

1 Polygon Scanner Motor

Product: Hybrid Ceramic Bearings

Hybrid Ceramic Bearings, which exhibit superior high speed performance, are widely used in high speed polygon scanner motors.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- Excellent reliability in high speed rotation

Use Conditions

Rotational speed: 26 000 min^{-1} or higher
Lubrication: Grease

2 Ultrasonic Motor in Magnetic Resonance Imagers

Product: Ceramic Bearings

The motors installed in magnetic resonance imagers (MRI) use magnetism insensitive Ceramic Bearings.

Vacuum	Clean	High temperature
Corrosive	Electric field	**Magnetic field**
High speed	Abrasion resistance	Low torque

- Compatible with strong magnetic field environments

Use Conditions

Rotational speed: 500 min^{-1}
Temperature: Room temp.
Lubrication: Grease

3 Switched Reluctance Motor

Product: Hybrid Ceramic Bearings

For high speed, high efficiency switched reluctance (SR) motors, which do not use coils or permanent magnets, Hybrid Ceramic Bearings are applied.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- Excellent reliability in high speed rotation

Use Conditions

Rotational speed: 30 000 min^{-1}
Lubrication: Grease

8 Medical equipment

CERAMIC BEARINGS

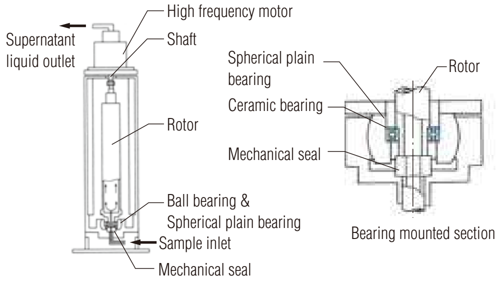
1 Blood Centrifuge

Product: Hybrid Ceramic Bearings (with special coating)

Corrosion resistance is required of bearings to be used in blood centrifuge especially to physiological saline.
Hybrid Ceramic Bearings with bearing rings coated with a corrosion resistant film are suitable for such corrosive environments.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

● **Corrosion resistance to physiological saline**



Use Conditions

Rotational speed: 20 000 min^{-1}
Temperature: –10 to 10°C
Lubrication: Grease

2 Ultrasonic Motor in Magnetic Resonance Imagers

Product: Ceramic Bearings

The motors installed in magnetic resonance imagers (MRI) use magnetism insensitive Ceramic Bearings.

Vacuum	Clean	High temperature
Corrosive	Electric field	**Magnetic field**
High speed	Abrasion resistance	Low torque

● **Compatible with strong magnetic field environments**

Use Conditions

Rotational speed: 500 min^{-1}
Temperature: Room temp.
Lubrication: Grease

9 Home electrical appliances

CERAMIC BEARINGS

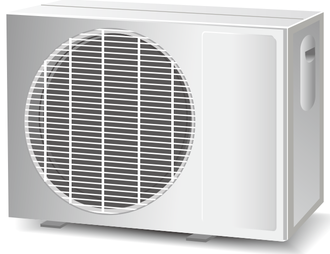
1 Air-conditioner motors

Product : Hybrid Ceramic Bearings

When using motors equipped with inverter control such as air-conditioner motors, there is a possibility of electric pitting defects occurring on motor bearings.
Using a ceramic — which is an insulator — as the rolling elements eliminates electric pitting.

Vacuum	Clean	High temperature
Corrosive	**Electric field**	Magnetic field
High speed	Abrasion resistance	Low torque

● **CElectric pitting prevent through insulation performance**



Use Conditions

Rotational speed: 3 000 min^{-1}
Load (preload): 1.5% C
Lubrication: Grease

2 Fan Motor

Product : Hybrid Ceramic Bearings

Bearing defects occur due to electric pitting in various motors.
Hybrid ceramic bearings are utilized as a measure against electric pitting.

Vacuum	Clean	High temperature
Corrosive	**Electric field**	Magnetic field
High speed	Abrasion resistance	Low torque

● **Prevention of electrical pitting**

Use Conditions

Rotational speed: 5 000 min^{-1}
Temperature: –10 to 120°C
Lubrication: Grease

10 Outer space, Leisure

CERAMIC BEARINGS

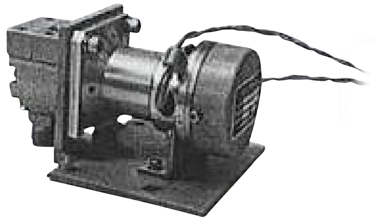
1 Outer Space Experimentation Equipment

Product: Ceramic Bearings

Utilized in experimental equipment on a space shuttle.
Stainless-steel bearings using fresh water as the lubricant experience abrasion and do not reach the required service life.
Using general ceramic bearings enables the required service life to be attained.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
High speed	**Abrasion resistance**	Low torque

● **Long Service Life under Freshwater Lubricating Conditions**



Use Conditions

Rotational speed: 10 000 min^{-1}
Temperature: 30°C
Load: Radial 5N, Axial 10N
Lubrication: Fresh water

2 Inline Skates

Product : Hybrid Ceramic Bearings

Because of their low running torque and high durability, Hybrid Ceramic Bearings are widely used in speed skates.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	**Low torque**

● **Low torque and improved durability**

Use Conditions

Rotational speed: 10 000 min^{-1}
Lubrication: Oil or grease

11 Automobiles, Motorcycles

CERAMIC BEARINGS

1 Turbocharger

Product: Hybrid Ceramic Bearings

Bearings supporting the main shaft of the turbocharger are responsive during acceleration and durable when using low-viscosity, dirty oil.
Hybrid ceramic bearings with superior reliability are utilized.

Vacuum	Clean	**High temperature**
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	Low torque

- Service life three times longer than that of ordinary bearings
- Acceleration response improved 20%
- Oil quantity reduced 80%

Use Conditions

Rotational speed: 180 000 to 210 000 min^{-1}
Temperature: 350°C
Lubrication: Oil

2 Fuel Injection System Control Valve

Product: Ceramic Ball

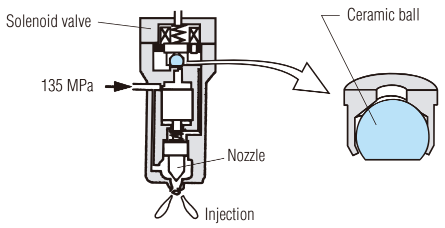
The common rail system (fuel injection system), which enables diesel engines to feature high power, good fuel economy and low emissions, is equipped with Ceramic Balls in the control valves.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
High speed	**Abrasion resistance**	Low torque

- Compatible with high pressure fuel injection thanks to improved wear resistance and seizure resistance

Use Conditions

Maximum pressure: 135 MPa



3 Wheel Bearings for Solar Cars

Product: Hybrid Ceramic Bearings

Stable operation of the motor section under severe open conditions of running eight hours or more per day. Improvements in weight reduction, durability and reliability.
Suppressing spinning resistance and efficiently transferring the driving force to the wheels contributes to saving power.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
High speed	Abrasion resistance	**Low torque**

- Australia: Covered over 3,000km vertically
- South Africa: Covered over 4,000km

Use Conditions

Rotational speed: 1 000 min^{-1}
Lubrication: Grease

Photo: Courtesy of Tokai University

4 Rally Car Hub Units

Product: Hybrid Ceramic Bearings

Excellent abrasion resistance even under severe environmental conditions has improved durability and reliability.

Vacuum	Clean	High temperature
Corrosive	Electric field	Magnetic field
High speed	**Abrasion resistance**	Low torque

- Utilized in the car entered in the Paris-Dakar Rally in 1997 and 1998
- Rigidity improved
- Unsprung weight reduced

Photos: Courtesy of Mitsubishi Motors Corporation

5 Motorcycle Superchargers

Product: Hybrid Ceramic Bearings

The new superchargers for large motorcycles utilize lightweight, high-strength ceramic balls capable of high-speed rotation. The incorporation of ceramic balls has achieved bearings with excellent high-speed performance, heat resistance and abrasion resistance. Additionally, when using hybrid ceramic bearings, high output is achieved even for race-specification motors operating under harsh conditions.

Vacuum	Clean	**High temperature**
Corrosive	Electric field	Magnetic field
High speed	**Abrasion resistance**	**Low torque**

- High-speed performance, heat resistance and abrasion resistance improved
- Contributes to achieving high output supporting race specifications

Properties of ceramic materials

CERAMIC BEARINGS

1 Material characteristics

Table 1 below lists the mechanical and physical properties of major ceramic materials used as bearing materials. Table 2 compares silicon nitride and high carbon chromium bearing steel.

Table 1 Mechanical and physical properties of ceramic materials used as bearing materials

Property	Unit / Ceramic Material	Silicon Nitride Si_3N_4	Zirconia ZrO_2	Silicon Carbide SiC
Density	g/cm^3	3.2	6.0	3.1
Linear expansion coefficient	K^{-1}	3.2×10^{-6}	10.5×10^{-6}	3.9×10^{-6}
Vickers hardness	HV	1 500	1 200	2 200
Module of longitudinal elasticity	GPa	320	220	380
Poisson's ratio		0.29	0.31	0.16
Three point bending strength	MPa	1 100	1 400	500
Fracture toughness	MPa·m$^{1/2}$	6	5	4
Heat resistance (in atmospheric air)	℃	800	200	1 000 or higher
Thermal shock resistance	℃	750 or higher	350	350
Coefficient of thermal conductivity	W/(m·K)	20	3	70
Specific heat	J/(kg·K)	680	460	670

Table 2 Comparison of characteristics of silicon nitride and high carbon chromium bearing steel

Property	Unit	Silicon Nitride Si_3N_4	High Carbon Chromium Bearing Steel SUJ2	Advantages of Ceramic Bearings
Density	g/cm^3	3.2	7.8	Decrease in centrifugal force induced by rolling elements (balls or rollers) → Longer service life and reduced bearing temperature rises
Linear expansion coefficient	K^{-1}	3.2×10^{-6}	12.5×10^{-6}	Decreased internal clearance change due to reduced bearing temperature rises → Lowered vibration and reduced preload changes
Vickers hardness	HV	1 500	750	Less deformation in rolling contact areas → Higher rigidity
Module of longitudinal elasticity	GPa	320	208	
Poisson's ratio		0.29	0.3	
Heat resistance	℃	800	180	Retention of superior load carrying characteristics under high temperature
Corrosion resistance		High	Low	Useful in acid or alkaline solutions
Magnetism		Non-magnetic	Ferromagnetic	Decreased rotational fluctuation in ferromagnetic field due to non-magnetization
Conductivity		insulator	conductor	Prevents electrical pitting
Bond		Covalent bond	Metallic bond	Decrease in adhesion (or material transfer) due to oil film thinning in rolling contact areas

2 Rolling fatigue of ceramic materials

The individual ceramic materials were tested for rolling fatigue under oil lubrication and under water lubrication, to evaluate their applicability as bearing material. Figs. 1 and 2 show the results of the tests.
The figures indicate that each ceramic material has a certain level of rolling fatigue strength and that silicon nitride has the highest fatigue strength among the ceramic materials tested.

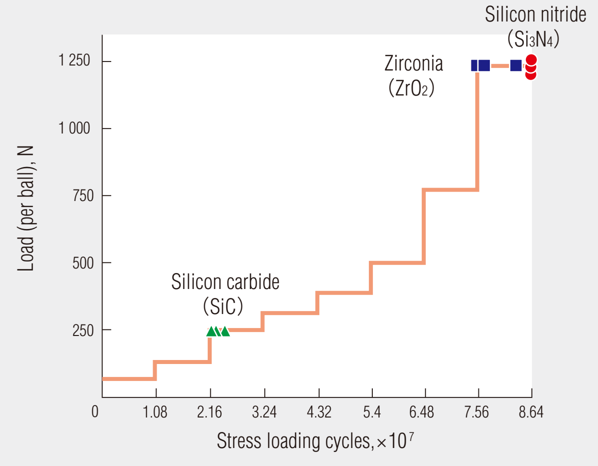

Fig. 1 Comparison in rolling fatigue life under oil lubrication

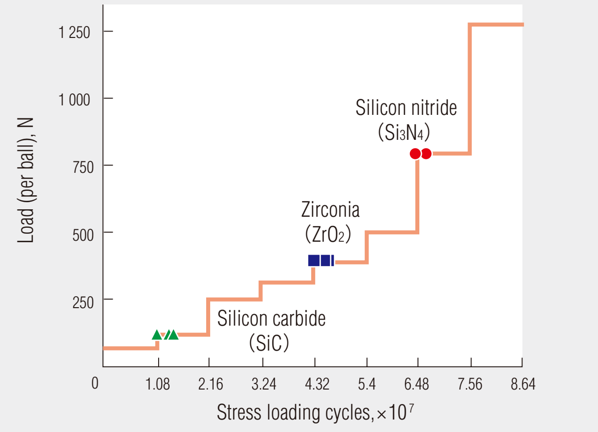

Fig. 2 Comparison in rolling fatigue life under water lubrication

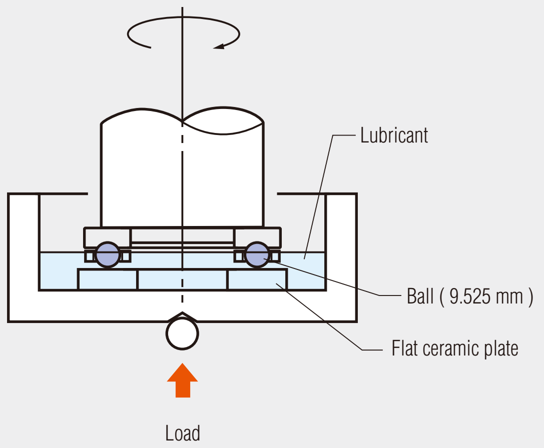
Test conditions

	Oil lubrication	Water lubrication
Lubricant	Spindle oil	City water
Ball	Bearing steel	Ceramic
Load	Increased in stages at every 1.08×10^7 cycles	
Rotational speed	1 200 min^{-1}	

Test equipment



Test equipment appearance

Fig. 3 Rolling fatigue life test conditions and test equipment

3 Ceramic materials suitable for rolling bearings

Table 3 shows the results of evaluating the ceramic materials in terms of their characteristics and the rolling fatigue strength. Among the ceramic materials tested, silicon nitride is the most suitable as rolling bearing material.
JTEKT uses the silicon nitride produced by the hot isostatic pressing (HIP) method as the standard ceramic material for bearings.

Table 3 Ratings of ceramic materials as rolling bearing materials

	Application to rolling bearings		
	Rating	Performance and use	Characteristics
Silicon nitride Si_3N_4	◎	･Comparable to bearing steel in load carrying capability and service life ･Suitable for high performance applications	･High speed ･High vacuum ･Corrosion resistant ･Heat resistant ･Non-magnetic ･High rigidity
Zirconia ZrO_2	○	･Useful under a limited load ･Applicable in highly corrosive chemicals	･Highly corrosion resistant
Silicon carbide SiC	○	･Useful under a limited load ･Applicable in highly corrosive chemicals	･Highly corrosion resistant ･Highly heat resistant

4 Composition of ceramic bearings

Koyo ceramic bearings are divided into Full Ceramic Bearings (with all components, namely, the outer ring, inner ring and rolling elements, made of ceramic) and Hybrid Ceramic Bearings (with only the rolling elements made of ceramic). The outer ring and inner ring of the Hybrid Ceramic Bearings are made from special steel, including high carbon chromium bearing steel. The cage may be made of a metallic material, resin, or composite material, depending on the intended operating conditions of the bearing.

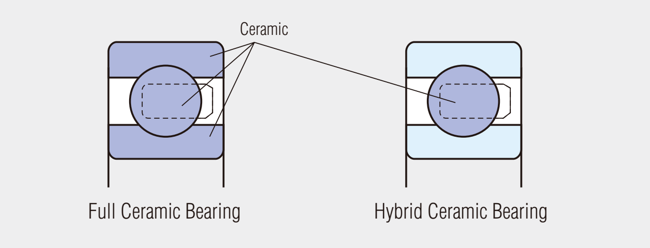


Fig. 4 Composition of ceramic bearings

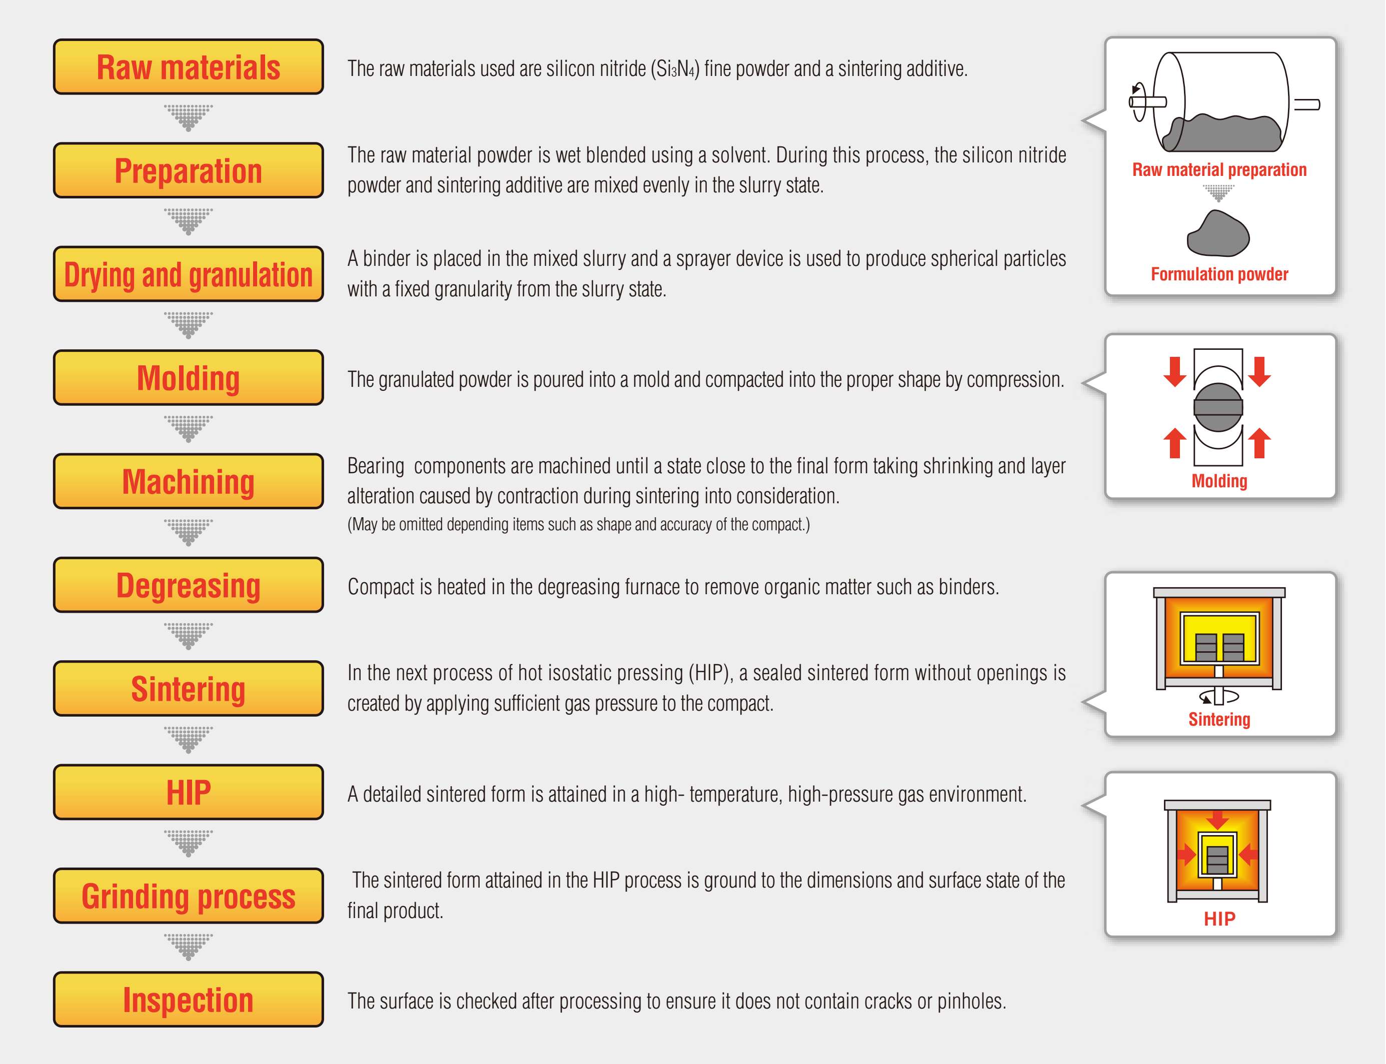
Ceramics Production Processes

CERAMIC BEARINGS

1 Production processes

With silicon nitride, characteristics such as density and strength can vary greatly depending on the manufacturing method and manufacturing conditions. Therefore, it is necessary to strictly control items such as shape, sintering and other processes when manufacturing silicon nitride for ball and roller bearings. The general manufacturing process is shown in Fig. 5.



Raw materials The raw materials used are silicon nitride (Si_3N_4) fine powder and a sintering additive.

Preparation The raw material powder is wet blended using a solvent. During this process, the silicon nitride powder and sintering additive are mixed evenly in the slurry state.

Drying and granulation A binder is placed in the mixed slurry and a sprayer device is used to produce spherical particles with a fixed granularity from the slurry state.

Molding The granulated powder is poured into a mold and compacted into the proper shape by compression.

Machining Bearing components are machined until a state close to the final form taking shrinking and layer alteration caused by contraction during sintering into consideration.
(May be omitted depending items such as shape and accuracy of the compact.)

Degreasing Compact is heated in the degreasing furnace to remove organic matter such as binders.

Sintering In the next process of hot isostatic pressing (HIP), a sealed sintered form without openings is created by applying sufficient gas pressure to the compact.

HIP A detailed sintered form is attained in a high- temperature, high-pressure gas environment.

Grinding process The sintered form attained in the HIP process is ground to the dimensions and surface state of the final product.

Inspection The surface is checked after processing to ensure it does not contain cracks or pinholes.

Fig. 5 Ball and roller Bearing Silicon Nitride Manufacturing Process

Ceramic Bearing Product Details

CERAMIC BEARINGS

Silicon nitride, a ceramic material, is more rigid than high carbon chromium bearing steel; therefore, a bearing including silicon nitride components is subject to a higher contact stress on the area of contact between bearing raceways and rolling elements. Accordingly, to estimate the service life of ceramic bearings, whether the rolling bearing theory is applicable or not is critical.

Basic dynamic load rating

The ISO standard defines the basic dynamic load rating as the pure radial load (for radial bearings), constant in magnitude and direction, under which the basic rating life of 1 million revolutions can be obtained, when the inner ring rotates while the outer ring is stationary or vice versa. The basic dynamic load rating represents the resistance of a bearing against rolling fatigue.

Basic static load rating

The basic static load rating is defined as the static load which corresponds to the calculated contact stress shown below, at the center of the most heavily loaded raceway/rolling elements.

Self-aligning ball bearings : 4 600 MPa
Other ball bearings : 4 200 MPa
Roller bearings : 4 000 MPa

JTEKT defines the dynamic load rating and static load rating of ceramic bearings based on the results of their service life tests, the maximum allowable static load of the ceramic materials, the elastic deformation test results of high carbon chromium bearing steel, and other related data, as shown in Table 4.

Table 4 Load ratings of ceramic bearings

	Full Ceramic Bearing	Hybrid Ceramic Bearing
Dynamic load rating C_r	Comparable to steel bearings	Comparable to steel bearings
Static load rating C_{0r}	Comparable to steel bearings	85% that of steel bearings

Note) The steel bearings here refer to bearings consisting of rings and rolling elements both made of high carbon chromium bearing steel.

1 Rolling fatigue life of ceramic bearings

A typical service life test for Ceramic Bearings and steel bearings was performed under the conditions specified in Fig. 7.

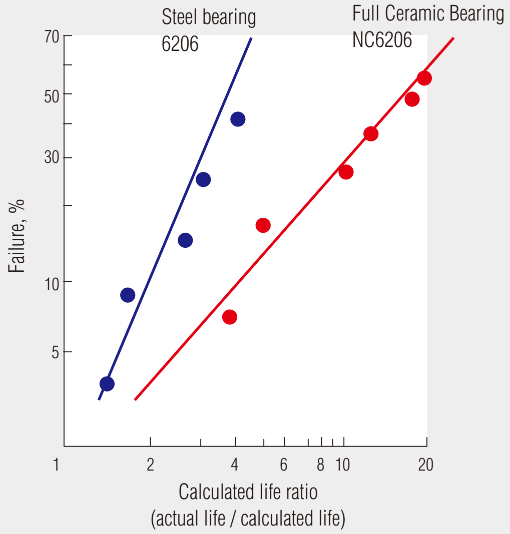
The test results showed that the service life of Ceramic Bearings was equal to or longer than that of steel bearings, exceeding the calculated life.

The Ceramic Bearings were found to exhibit flaking (Fig. 6) when their service life terminated. The same phenomenon was observed on the steel bearings whose service life terminated.

Based on these findings, as the dynamic load rating of a Ceramic Bearing, that of a steel bearing of the same dimensions can be used.

Ceramic ball
Ceramic inner ring

Fig. 6 Flaking on ceramic ball and inner ring



Rolling fatigue test conditions

Bearing number	Material (outer/inner rings and balls)	Dimensions, mm
NC6206	Silicon nitride (Si_3N_4)	30 × 62 × 16 (bore × outside dia. × width)
6206	Bearing steel (SUJ2)	

Specification	Condition
Load	5 800 N
Rotational speed	8 000 min^{-1}
Lubrication oil	AeroShell Turbine Oil 500
Temperature	70 ± 2 ℃

Fig. 7 Rolling fatigue life of Full ceramic bearings and steel bearings

2 Static load rating of ceramic bearings

The basic static load rating of a steel bearing represents a load that produces a localized permanent deformation in the rolling element/raceway contact area, impeding smooth rotation.

However, ceramic materials, which are highly rigid, produce little permanent deformation. Therefore, the theory of the basic static load rating for steel bearings is not applicable to ceramic bearings.

Static load rating of Full Ceramic Bearings

When exposed to continuous excessive loads, ceramic materials may break down; however, before breakdown occurs, the materials develop cracking.

Fig. 8 compares the load measurements at which ceramic balls developed cracking with the basic static load ratings of steel bearings. Fig. 9 shows the measurement system.

As these results show, the loads at which cracks develop on the Full Ceramic Bearing are far higher than that of the basic static load rating of steel bearings. This means that the basic load ratings specified in the ISO standard can be used as the allowable static loads of the Full Ceramic Bearing.

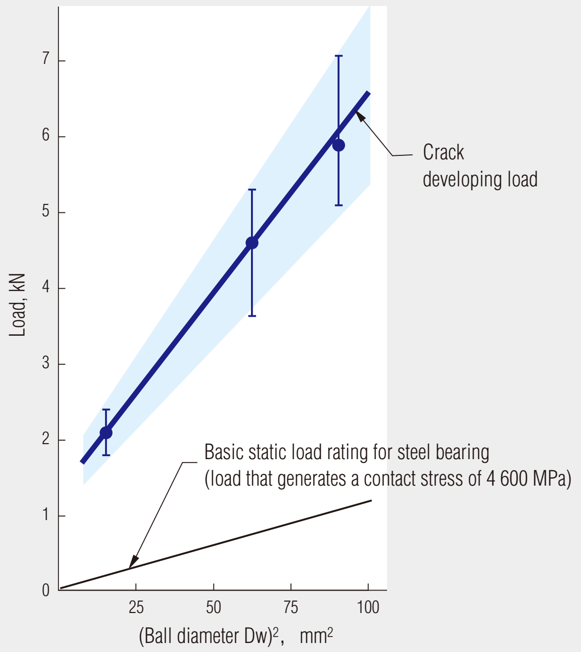


Fig. 8 Crack developing loads for Full Ceramic Bearings

Static load rating of Hybrid Ceramic Bearings

The theory of the static load rating for steel bearings is applicable to Hybrid Ceramic Bearings because their outer and inner rings are made of steel and accordingly any deformation is permanent.

Table 5 shows the results of a test for which a high carbon chromium bearing steel ball and ceramic ball were pressed against a flat plate of high carbon chromium bearing steel and the resulting permanent deformations (indentation depths) on the flat plate and balls were measured.

Table 5 Measurements of permanent deformation produced on flat steel plate and balls

Load kN		Permanent deformation (average), mm		Permanent deformation (sum of averages), mm
		Flat plate (bearing steel)	Ball	
Ceramic ball	0.65	0.5	—	0.5
	1.3	1.9	—	1.9
	2.6	5.2	—	5.2
	3.9	9.3	—	9.3
Steel ball	0.65	0.4	—	0.4
	1.3	1.3	0.11	1.41
	2.6	4.0	0.41	4.41
	3.9	6.8	1.18	7.98

These results indicate that ceramic balls do not suffer permanent deformation and that the permanent deformation produced on the flat steel plate by the ceramic balls is approximately 1.2 times the sum of the deformation produced on the flat plate by steel ball and the deformation that the steel ball undergo.

Accordingly, the static load rating of Hybrid Ceramic Bearings can be determined based on the permanent deformation of their bearing steel rings. JTEKT uses the load equal to 85% of the static load rating of steel bearings as the static load rating of the Hybrid Ceramic Bearings.

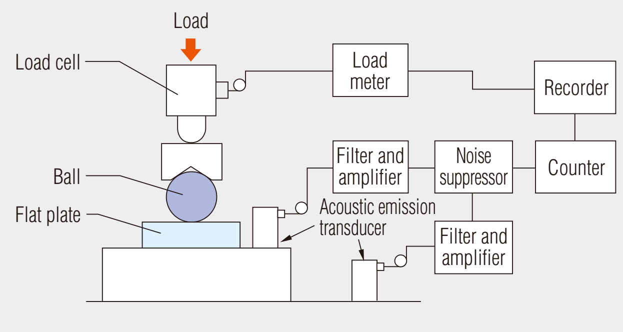

Fig. 9 Crack generating load measurement system

3 Impact strength of ceramic bearings

To evaluate the impact strength of ceramic bearings, ceramic balls were crushed by two methods: by a static load and an impact load. The test results are shown in Fig. 10. Fig. 11 shows the testing methods.

This figure shows that the impact strength of the ceramic bearings is almost equal to the static load strength, which means the bearings possess sufficient impact strength.

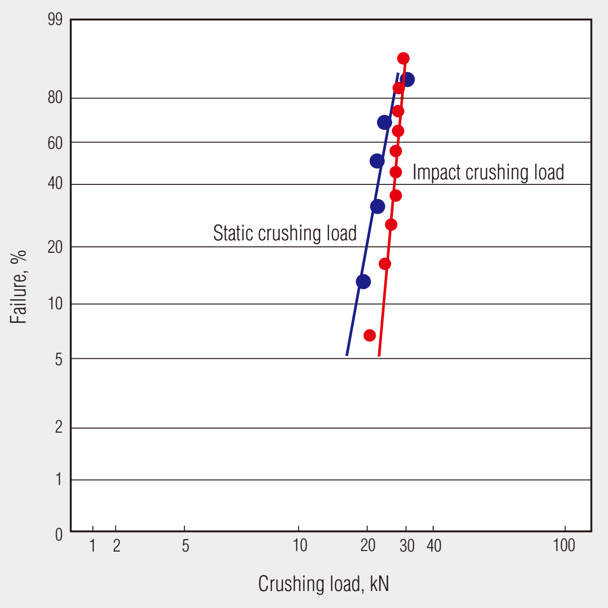

Fig. 10 Comparison of static load and impact load that crush ceramic balls

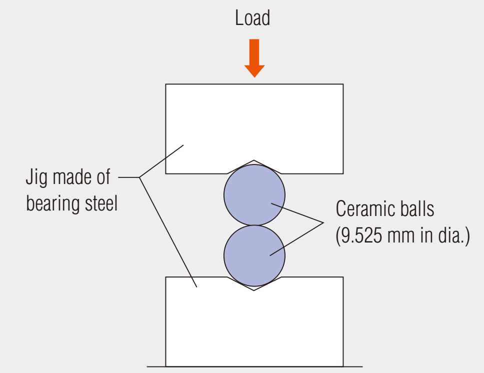
○ Static crushing test



○ Impact crushing test

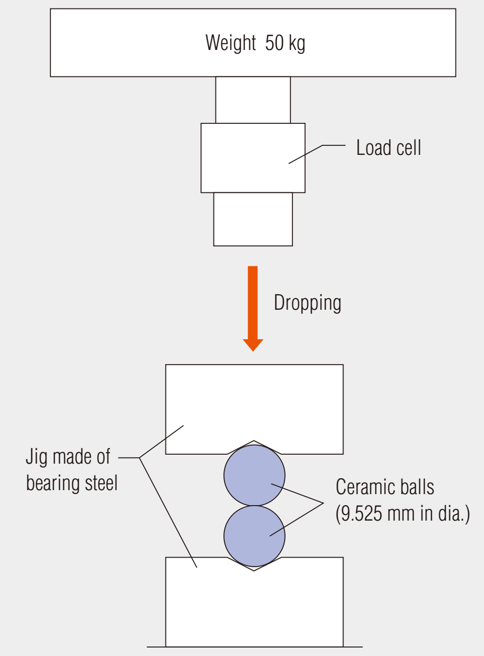


Fig. 11 Ceramic ball crushing test method

4 Fitting of ceramic bearings

When using ceramic bearings, it should be noted that ceramic materials are largely different from steel materials in the coefficient of linear expansion. Attention should therefore be paid to fitting stresses and temperature rises. The following are the results of evaluating the fitting of a Ceramic Bearing on a stainless steel shaft.

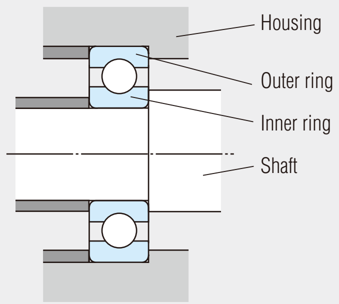

Fig. 12 Bearing fitting

Maximum stress produced by fitting

Table 6 shows the results of a static strength test conducted on a ceramic ring fitted on a stainless steel shaft. Table 7 shows the results of a dynamic strength test (running test) conducted on a ceramic ring fitted on a stainless steel shaft.

Based on the results of these tests, JTEKT makes it a rule for the maximum stress produced by interference to be no greater than 150 MPa when a ceramic inner ring is fitted on a stainless steel shaft.

Consult JTEKT for applications requiring tighter fitting.

○ Table 6 Typical results of static strength test on ceramic bearing shaft fitting

	Interference, L_{10} µm	Ring's fracture stress MPa
Solid shaft	50	399
Hollow shaft	68	332

○ Table 7 Typical results of dynamic strength test on ceramic bearing shaft fitting

	Max. allowable interference µm	Max. allowable stress for ring MPa
Solid shaft	31	243
Hollow shaft	43	204

Fig. 13 Ceramic inner ring damaged by dynamic strength test

Influence of temperature

During operation, bearing temperature exceeds the ambient temperature. When a ceramic bearing is operated on a stainless steel shaft or in a stainless steel housing, the interference with the shaft increases due to the difference in linear expansion coefficient while the interference with the housing decreases. (When the outer ring is loose-fitted, the clearance increases.)

To determine the class of fit for a ceramic bearing, the maximum temperature during operation should be assessed carefully.

■ The maximum stress generated on the inner ring due to the interference with the shaft can be determined from the following equation:

$$\sigma = P_m \cdot \frac{D_i^2 + d^2}{D_i^2 - d^2}$$

$$P_m = \varDelta_{deff} \left[\frac{d}{E_B} \left(\frac{D_i^2 + d^2}{D_i^2 - d^2} + \nu_B \right) + \frac{d}{E_S} \left(\frac{d^2 + d_0^2}{d^2 - d_0^2} - \nu_S \right) \right]^{-1}$$

σ : Maximum circumferential stress to interference (MPa)
P_m : Pressure of contact on fitting surface (MPa)
d , D_i : Inner ring bore diameter and outside diameter (mm)
$\varDelta_{deff}$: Effective interference of inner ring (mm)
d_0 : Bore diameter of hollow shaft (mm)
E_B , ν_B : Bearing's modulus of longitudinal elasticity and Poisson's ratio (MPa)
E_S , ν_S : Shaft's modulus of longitudinal elasticity and Poisson's ratio (MPa)

Ceramic Bearing Capacities

CERAMIC BEARINGS

1 Corrosion resistance

Table 8 shows the corrosion resistance of ceramic materials. Silicon nitride, which is used as the standard material of the ceramic bearings, is excellent in corrosion resistance. However, it may develop corrosion in a highly corrosive chemical, a high temperature, or other highly corrosive ambient condition.

Table 8 Corrosion resistance of ceramic materials

◎ : Fully resistant ○ : Almost resistant △ : Slightly susceptible × : Susceptible

Corrosive solutions \ Ceramic materials	Silicon nitride (standard) Si_3N_4	Corrosion resistant silicon nitride Si_3N_4	Zirconia ZrO_2	Silicon Carbide SiC
Hydrochloric acid	△	○	○	◎
Nitric acid	△	○	○	◎
Sulfuric acid	△	○	○	◎
Phosphoric acid	○	○	○	◎
Fluorine acid	△	△	×	◎
Sodium hydroxide	△	△	○	△
Potassium hydroxide	△	△	△	△
Sodium carbonate	△	△	△	△
Sodium nitrate	△	△	△	△
Water and saltwater	◎	◎	◎	◎

Note) The corrosive natures of individual solutions differ largely depending on the concentration and temperature. Note that mixing two or more chemicals may increase the corrosivity.

There are two types of ceramic corrosion: One is the corrosion of the alumina-yttria system sintering aid (Al_2O_3-Y_2O_3), which is used to bake ceramic materials. To avoid this type of corrosion, corrosion resistant silicon nitride treated with a spinel sintering aid ($MgAl_2O_4$) should be used. Fig. 14 shows the mass reduction and bending strength deterioration of corrosion resistant silicon nitride dipped in an acid or alkaline solution for a given period of time.

The other type of corrosion is the corrosion of the silicon nitride itself. For use in a highly corrosive solution, bearings made of zirconia (ZrO_2) or silicon carbide (SiC) may be effective.

To select a ceramic bearing for use in a highly corrosive environment, its corrosion resistance to the specific condition should be carefully examined.

Service life of corrosion resistant bearings

Table 9 lists the bearings suitable for applications requiring corrosion resistance, along with their major applications.

Table 9 Typical corrosion resistant Ceramic Bearings

	Applications	Bearing Materials	
		Bearing Rings	Balls
Corrosion Resistant Hybrid Ceramic Bearing	In water, alkaline environment and reactive gas	SUS630	Silicon nitride
Ceramic Bearing	In a slightly acidic environment, alkaline environment and reactive gas	Silicon nitride	Silicon nitride
Corrosion Resistant Ceramic Bearing	In a strongly acidic environment, strongly alkaline environment and reactive gas	Corrosion resistant silicon nitride	Corrosion resistant silicon nitride
High Corrosion Resistant Ceramic Bearing	In a strongly acidic environment, strongly alkaline environment and corrosive gas	Silicon carbide	Silicon carbide

When Ceramic Bearings are operated in a solution, the solution serves as a lubricant. This means the solution is closely associated with the service life of the bearings. Fig. 15 shows the service life evaluation results for three types of Ceramic Bearings under water.

The Ceramic Bearings terminate their service life due to the flaking on the bearing ring or ball surfaces.

In case of the Hybrid Ceramic Bearings, ceramic balls do not develop flaking or wear. Their service life ends due to wear attributed to the minute corrosion of stainless steel bearing rings.

When bearings are used in a solution whose lubrication performance is not enough, such as in water, it is important to evaluate in advance the susceptibility of the bearings to corrosion and the relationship between the bearing load and wear in the solution.

SUS440C has a longer service life than SUS630; however, the former steel is not suitable for use in water because it may rust and cause contamination.

Ceramic Bearings may develop wear at an early stage of use depending on the characteristics of the solution, temperature, and load. Please contact JTEKT before using Ceramic Bearings in solutions.

Test conditions

Bearing No.: 6206 or equivalent
Rotational speed: 1 500 min^{-1}

Radial load:
Ceramic Bearing: 1 470 N
Corrosion Resistant Hybrid Ceramic Bearing: 196 N
Hybrid Ceramic Bearing: 196 N

Fig. 15 Comparison in underwater service life of Ceramic Bearings

2 Non-magnetic performance

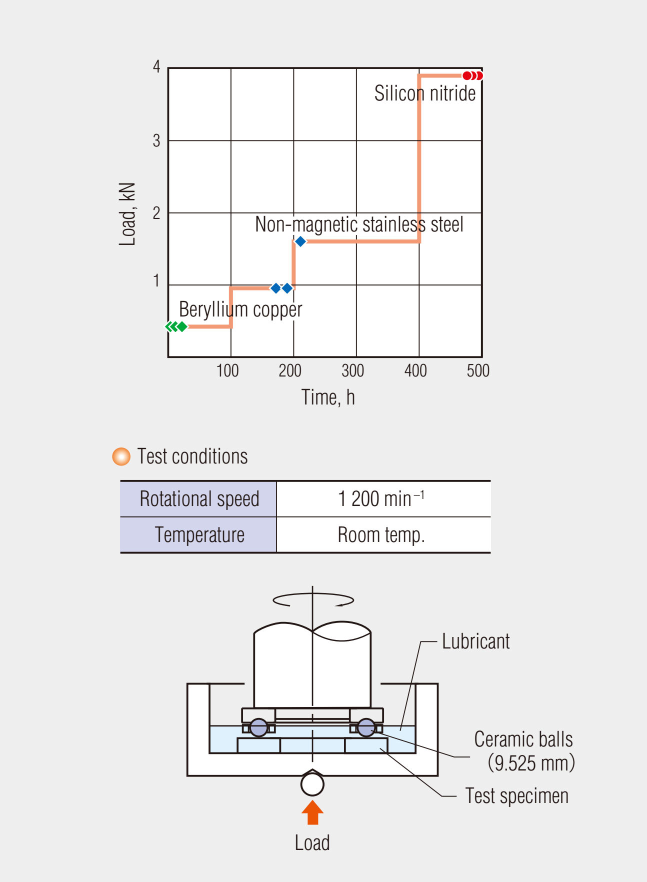
Bearings may be exposed to magnetic fields in some applications, including equipment associated with super conductivity, semiconductor production facilities and medical examination facilities. If steel bearings are used for such applications, the running torque may fluctuate or the magnetic field may be disturbed . Non-magnetic bearings should be used for such applications. As a non-magnetic material for such bearings, beryllium copper has conventionally been used. However the use of beryllium copper should be avoided since it contains beryllium, a substance of environmental concern.

For such applications, JTEKT supplies Hybrid Ceramic Bearings, whose rings are made of non-magnetic stainless steel and rolling elements are made of a ceramic material, or the full ceramic bearings.

Table 10 Non-magnetic bearings and relative permeability

	Relative permeability
Non-magnetic Hybrid Ceramic Bearings	1.01 or lower
Ceramic Bearing	1.001 or lower
(Ref.) Beryllium copper	1.001 or lower

Fig. 16 shows a rolling fatigue strength evaluation result for various non-magnetic materials. As can be seen from the figure, non-magnetic stainless steel is superior to beryllium copper in rolling fatigue strength.



Test conditions

Rotational speed	1 200 min^{-1}
Temperature	Room temp.

Fig. 16 Comparison of non-magnetic materials in rolling fatigue strength

3 Insulation

A cause of bearing failure in motors or generators is electric pitting. Electric pitting occurs when a surface in rolling contact is locally molten due to sparks produced over the very thin lubricating oil film on the surface when electricity passes through the bearing in operation.

Electric pitting appears as a series of pits or a series of ridges on the surface in rolling contact, which is shown in Fig. 17 and Fig. 18.

An estimation of the mechanism that causes electric pitting on a bearing is shown in Fig. 19.

Fig. 17
Electric pitting generated on general purpose bearings (pits)

Fig. 18
Electric pitting generated on general purpose bearings (ridges)

To avoid such pitting, a bypass is provided to ensure that no electric current passes through the bearing. Another method is to use an insulating bearing that can block electric current.

Since ceramic materials exhibit an excellent insulation performance, Hybrid Ceramic Bearings consisting of ceramic rolling elements can be used as insulating bearings.

Hybrid Ceramic Bearings prevent electric pitting, also reduce bearing temperature rise, and lengthen grease service life. For these reasons, Hybrid Ceramic Bearings assure long term maintenance free operation and high speed equipment operation.

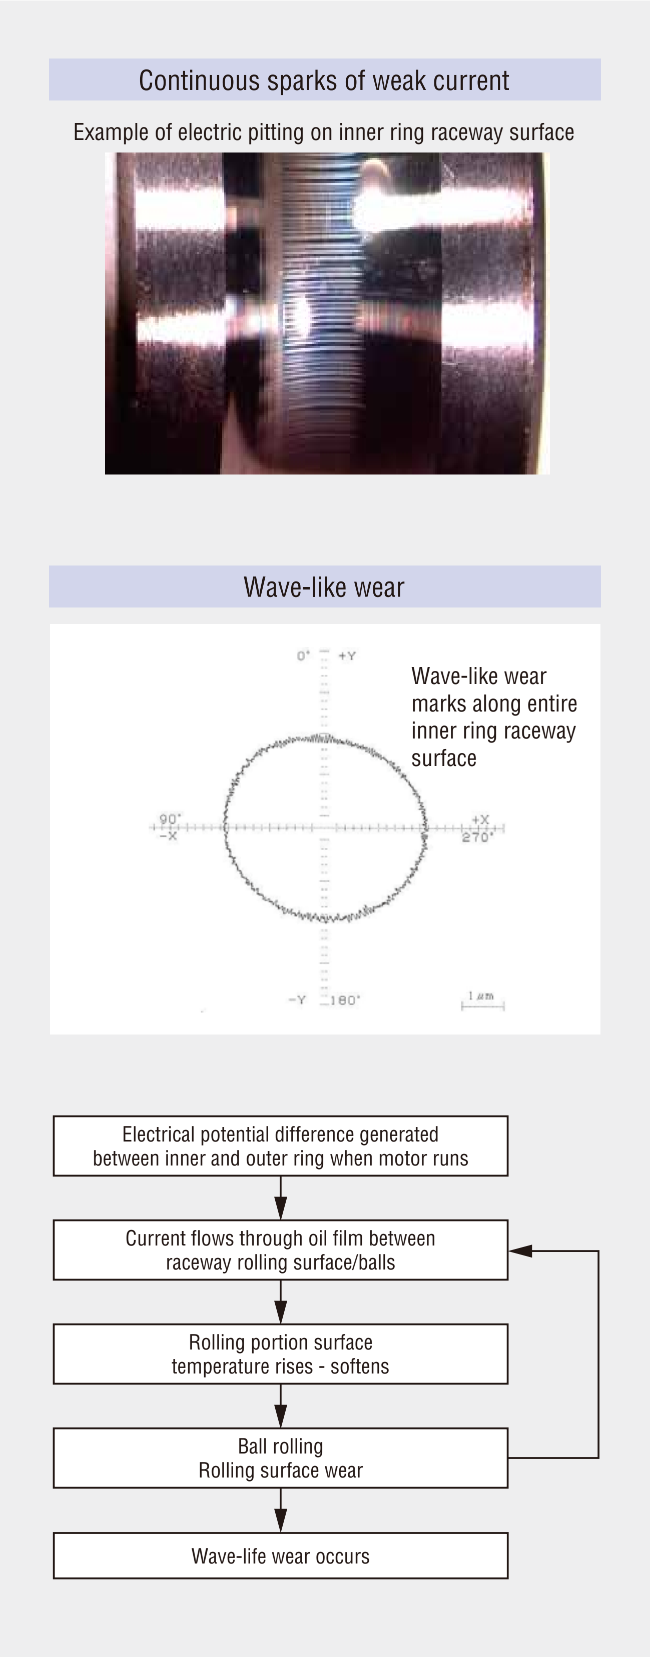


Fig. 19 Estimation of electric pitting (wave-like wear) occurrence mechanism

4 High-speed performance

Hybrid Ceramic Bearings, whose rolling elements are made of a ceramic material with a density lower than that of bearing steel, are most suitable for high speed applications. This is because reduced mass of rolling elements suppresses the centrifugal force of the rolling elements, as well as slippage attributable to the gyro-moment, when the bearings are in operation.

Thanks to their superior high speed performance, Hybrid Ceramic Bearings are used in turbochargers and on machine tool spindles.

Power losses at high speed

Fig. 20 compares power losses between the Hybrid Ceramic Bearings and steel bearings.

When compared to steel bearings, the Hybrid Ceramic Bearings lose smaller power during high speed operation. The power loss decreases with increasing rotational speed.

The Hybrid Ceramic Bearings also have superior antiseizure characteristics, which means that they consume smaller amount of lubrication oil and thereby reduce rolling resistance (power loss).

		Hybrid Ceramic Bearings	Steel bearings
Bearing rings		High speed tool steel (M50)	
Balls	Material	Ceramic (Si_3N_4)	High speed tool steel (M50)
	Dia.	6.35 mm	
	Number of balls	9	
Cage		Polyimide resin	

Condition	Specification
Axial load	200 N
Rotational speed (max.)	100 000 min^{-1}
Lubricating oil	AeroShell Turbine Oil 500
Ambient temperature	Room temp.

Fig. 20 Comparison in power loss between Hybrid Ceramic Bearings and steel bearings

Seizure limit at high speed

Fig. 21 shows the seizure limits of Hybrid Ceramic Bearings and steel bearings. The limits were measured by gradually reducing lubricating oil feed rate.

Compared with general purpose steel bearings, Hybrid Ceramic Bearings consume smaller amount of lubricating oil under the same speed condition, while they can run at a higher speed under the same luburicating oil feed rate condition.

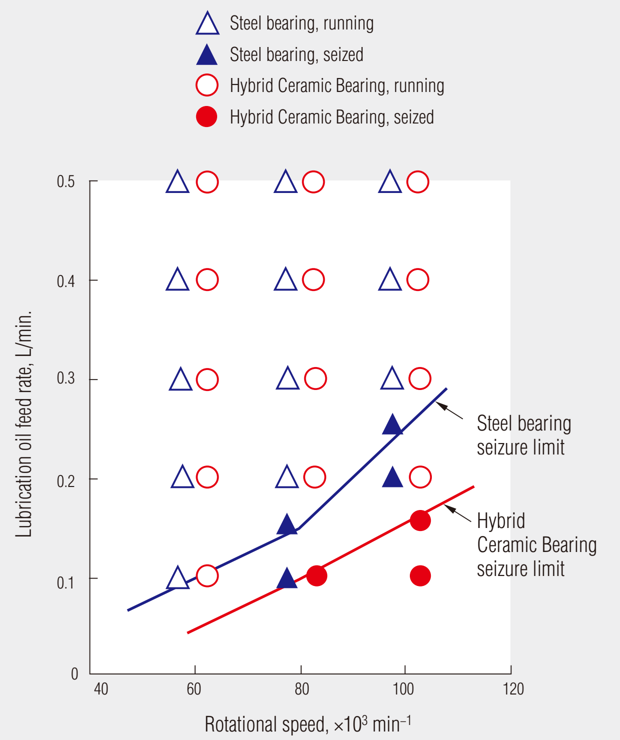

Fig. 21 Comparison between Hybrid Ceramic Bearings and steel bearings in seizure limit

1 Ceramic balls

JTEKT also supplies Ceramic Balls (silicon nitride), which have excellent resistance to wear and seizure, and are usable in corrosive environments and ultrahigh vacuums. Other major features of these balls are excellent heat resistance (up to 800°C), high rigidity, lightweight (40% compared to bearing steel), non-magnetic, and have insulating characteristics.

The Ceramic Balls are useful in many applications such as jigs, tools, gauges, solenoid valves, check valves, other valve varieties, high grade bicycle parts, automotive parts, and machine components.

Table of Dimensions and Masses

Nominal dimension		Nominal outside diameter mm	Precision grade [1]	Mass [2] (per piece)
mm	inch			
0.8		0.800 00	3 and 5	0.866 mg
1.0		1.000 00		1.691 mg
1.2		1.200 00		2.922 mg
	1/16	1.587 50		6.766 mg

Tapered Roller Bearings

for axle drive pinions

JTEKT

JTEKT CORPORATION

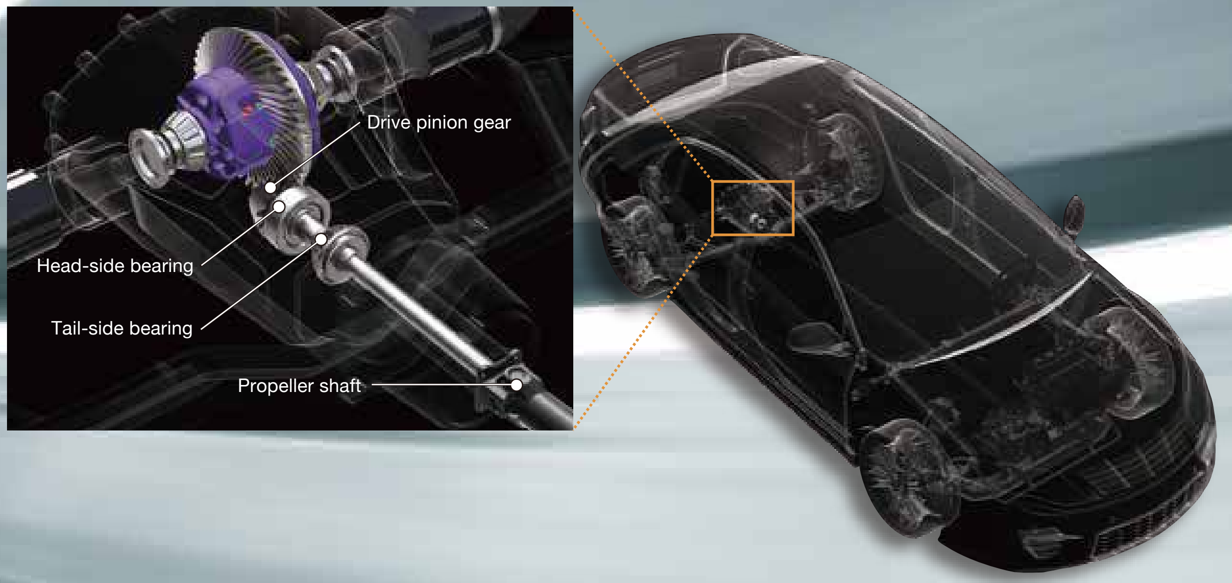
CAT.NO.B1006E-1

Compact & Lightweight, Low-torque, High-capacity & High-durability. JTEKT's TRBs support enhancement of vehicle's environmental performance.

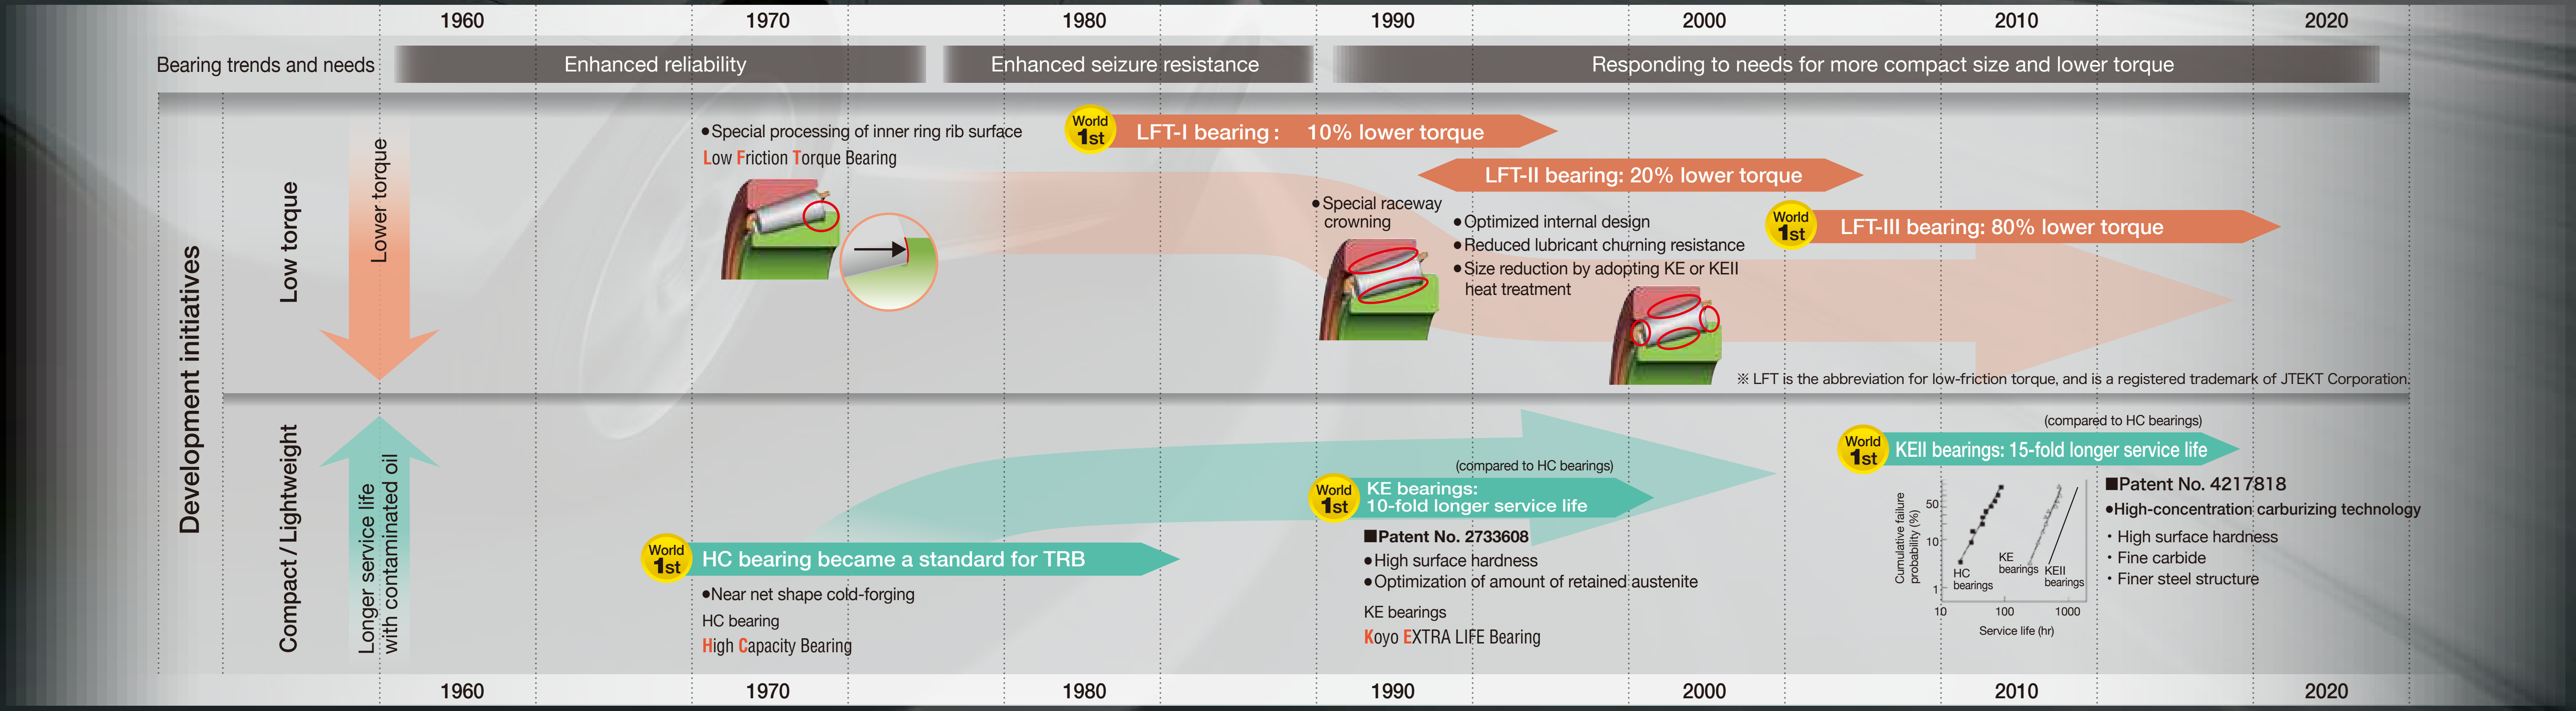
In automobile axles, various stresses are caused by acceleration, deceleration, and cornering forces in a complex manner from all directions.
They're truly a key mechanical part of every vehicle. In response to the demand for ever more advanced bearings that support drive pinions, JTEKT goes one step beyond making proposals. Every elemental technology imaginable is rethought from scratch to ensure products with unequalled levels of low friction loss and high capacity.

Tapered roller bearings for axle drive pinions

Drive pinion bearings support the drive pinion gear shaft of the hypoid gear,
which facilitates a 90° directional change of the driving force transmitted from the propeller shaft.
This bearing is used in pairs to simultaneously ensure smooth rotation and the rigidity of gear meshing points.



Tapered roller bearing development timeline (for automobile drivelines)



- Special processing of inner ring rib surface

Low Friction Torque Bearing

World 1st LFT-I bearing : 10% lower torque

LFT-II bearing: 20% lower torque

- Special raceway crowning

- Optimized internal design
- Reduced lubricant churning resistance
- Size reduction by adopting KE or KEII heat treatment

World 1st LFT-III bearing: 80% lower torque

※ LFT is the abbreviation for low-friction torque, and is a registered trademark of JTEKT Corporation.

World 1st HC bearing became a standard for TRB

- Near net shape cold-forging

HC bearing
High Capacity Bearing

(compared to HC bearings)
World 1st KE bearings: 10-fold longer service life

■Patent No. 2733608
- High surface hardness
- Optimization of amount of retained austenite

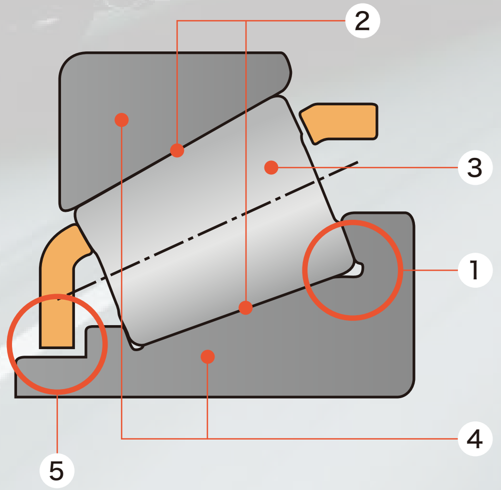
KE bearings
Koyo EXTRA LIFE Bearing

(compared to HC bearings)
World 1st KEII bearings: 15-fold longer service life

■Patent No. 4217818
- High-concentration carburizing technology
  - High surface hardness
  - Fine carbide
  - Finer steel structure

Tapered Roller Bearings **Torque reduction technologies LFT**

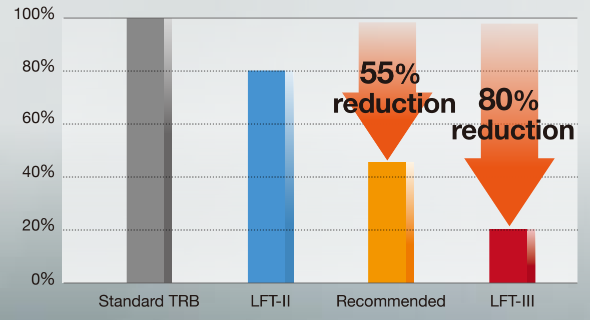
Target To reduce bearing rotational torque by focusing on friction loss caused by sliding, rolling and lubricant churning.



Applied technologies	LFT-II	Recommended	LFT-III
① Optimized surface roughness and shape of sliding parts	▮	▮	▮
② Optimized raceway crowning profile	▮	▮	▮
③ Optimized internal design		▮	▮
④ Size reduction enabled by excellent heat-treatment technologies		▮	▮
⑤ Control of lubricating oil flow			▮

Performance “Recommended” models significantly contribute to torque reduction compared to standard TRBs.

For axle drive pinion application, we are pleased to propose a model specially designed for that purpose as a recommended model. In addition, we can offer LFT-III as its option since LFT-III has a premium specification including the control of lubricating oil flow.



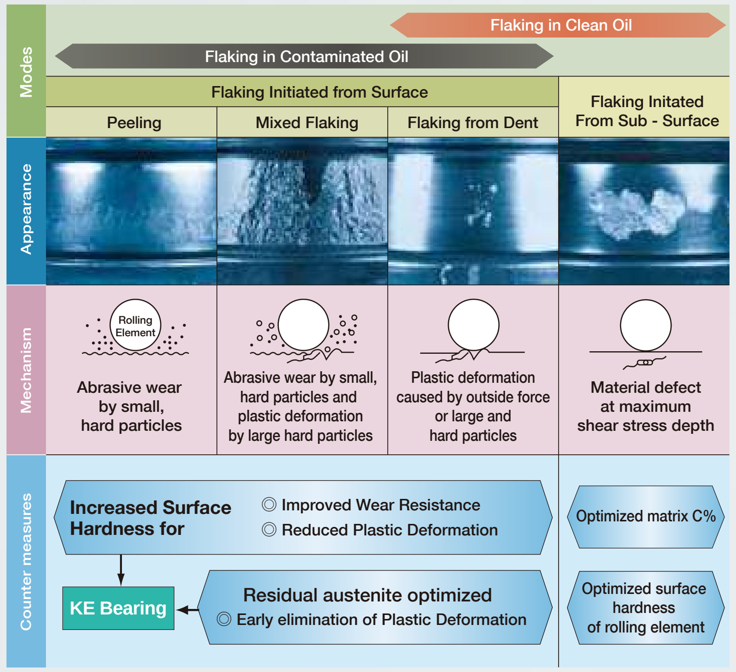
Tapered Roller Bearings
KE Bearing—Embodiment of Size/Weight Reduction Technologies

Target Significant extension of service life with contaminated oil by adopting JTEKT’s own heat treatment technologies.

1. Increase bearing surface hardness
2. Optimize the amount of retained austenite

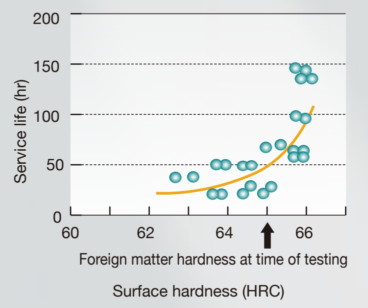
Effective to surface originated flaking which occurs when lubricated by contaminated oil

Bearing flaking mode

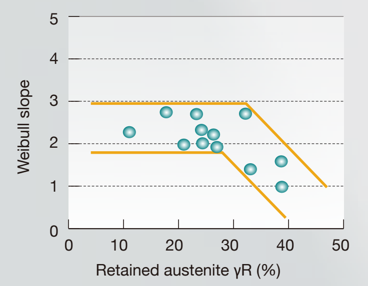


Modes	Flaking in Contaminated Oil Flaking Initiated from Surface Peeling	Flaking in Contaminated Oil Flaking Initiated from Surface Mixed Flaking	Flaking in Contaminated Oil / Flaking in Clean Oil Flaking Initiated from Surface Flaking from Dent	Flaking in Clean Oil Flaking Initated From Sub - Surface
Appearance				
Mechanism	Rolling Element Abrasive wear by small, hard particles	Abrasive wear by small, hard particles and plastic deformation by large hard particles	Plastic deformation caused by outside force or large and hard particles	Material defect at maximum shear stress depth
Counter measures	Increased Surface Hardness for ◎ Improved Wear Resistance ◎ Reduced Plastic Deformation Residual austenite optimized ◎ Early elimination of Plastic Deformation KE Bearing			Optimized matrix C% Optimized surface hardness of rolling element

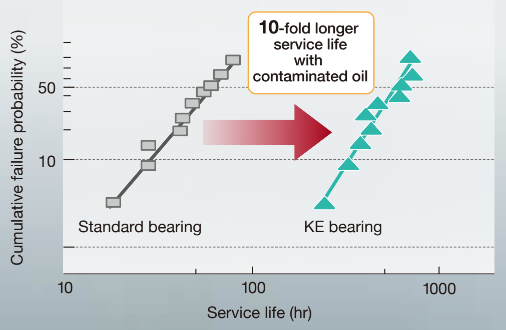
■Relationship between bearing surface hardness and service life with contaminated oil



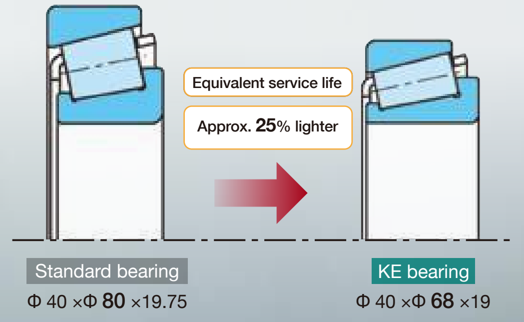
■Relationship between the amount of retained austenite and Weibull slope with contaminated oil



Performance Longer service life with contaminated oil



Size/ Weight reductions Contribution to fuel economy enhancement

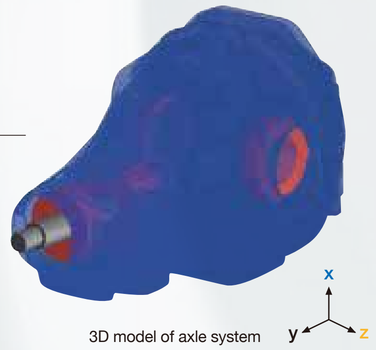


Example Technology Review

CAE analysis

JTEKT's design and development are conducted utilizing the latest equipment in an advanced CAE environment.

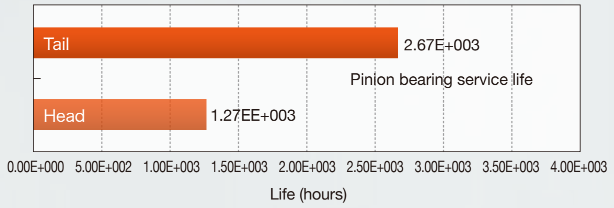
As JTEKT developed its own high-precision tapered roller bearing's torque calculation formula based on accumulated data, research and analysis, rotational torque can be easily obtained and used for examination.
JTEKT considers the rigidity of whole axle system, which supports the axle, bearing service life, contact stress, etc. and propose the best TRBs for your applications.



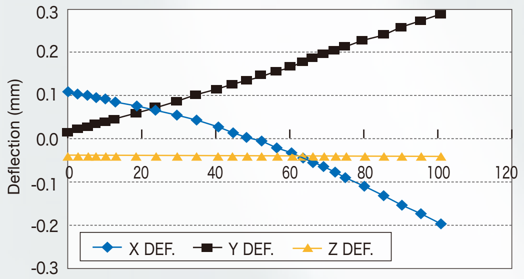
3D model of axle system

Calculation is possible as axle system.

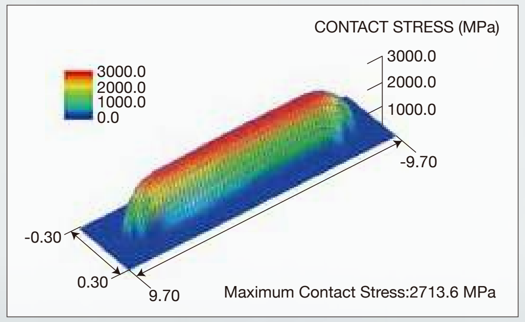
Service life calculation

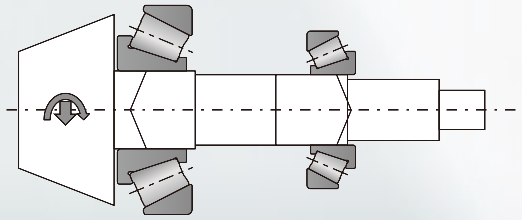


Deflection of pinion gear's meshing point



Surface pressure calculation





Simulation test equipment

In response to customers' requests, we conduct evaluations utilizing various vehicle driving conditions.

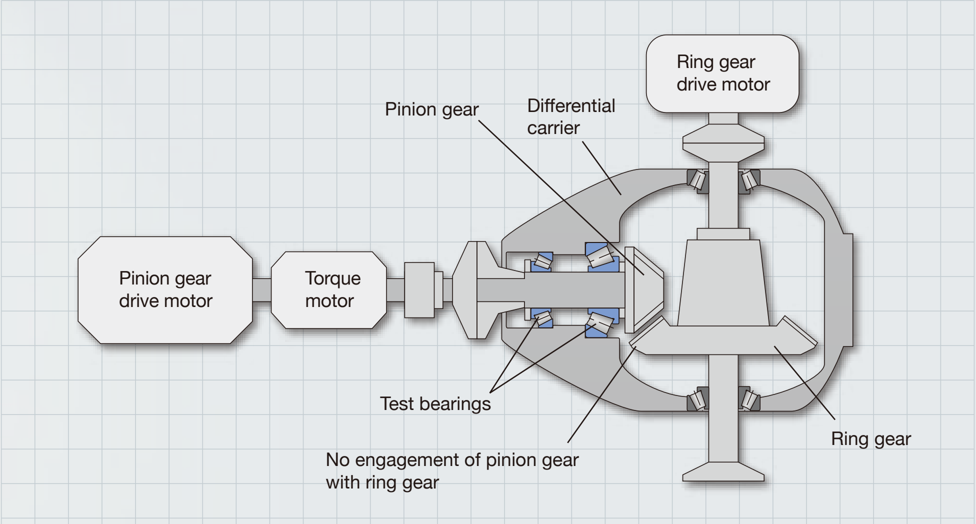
At JTEKT, prior to evaluations in actual vehicles, evaluations simulating various driving conditions are possible (such as oil flow check and torque loss measurement), which enables the reduction of development and evaluation periods.

Simulation of mountain road driving, high-speed cornering, driving in urban areas, etc.

Nose angle | Turning angle | Longitudinal G force | Lateral G force | Load
Rotational speed | Temp

Example Evaluation

CAE analysis result is verified by using an actual final reduction gear unit with an actual drive pinion.



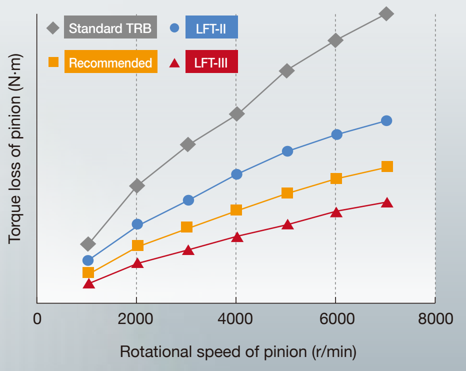
Schematic diagram of test equipment

Pinion bearing torque measurement results

Recommended ▶Max.55%torque reduction

LFT-III ▶Max.80%torque reduction

※ Compared to Standard TRB

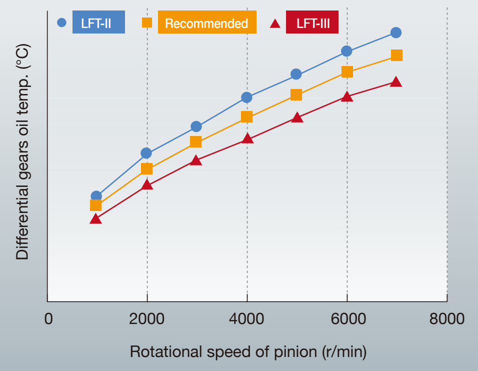


Oil temperature measurement results of differential gears

Recommended ▶Max. temp. rise controlled to 11℃

LFT-III ▶Max. temp. rise controlled to 20℃

※ Compared to LFT-II



Testing methods:
"Pinion bearing torque measurement results" for torque reduction and
"Oil temperature measurement results of differential gears"for temperature rise.

Global Technical Support (Bearing Development Bases)

Technical centers located around the world ensure quick response and technical support for customers' needs.

Iga Proving Ground Enables Testing / Evaluations Simulating Roads Worldwide

Fully utilizing our knowledge as a world-leading systems supplier, JTEKT conducts driving evaluations and analyses of products installed in vehicles. We exhaustively pursue the highest standards in product safety and operation on a test course capable of simulating various road and weather conditions around the world. As a total systems supplier, our highest value is to provide our customers with products that deliver outstanding performance and the best quality that help to make automobiles that are more than just fun to drive.

■ JTEKT Iga Proving Ground

- Site area: 500,000m²
- Course area: 170,000m²
- Combined circuit length: 2,200m
- Dynamics pad area: 54,000m²

Recommended Series Bearing Numbers

Please select from the recommended bearing numbers when considering axle drive pinion bearings.

BALL HUB UNITS

JTEKT

JTEKT CORPORATION

CAT.NO.B1004E-1

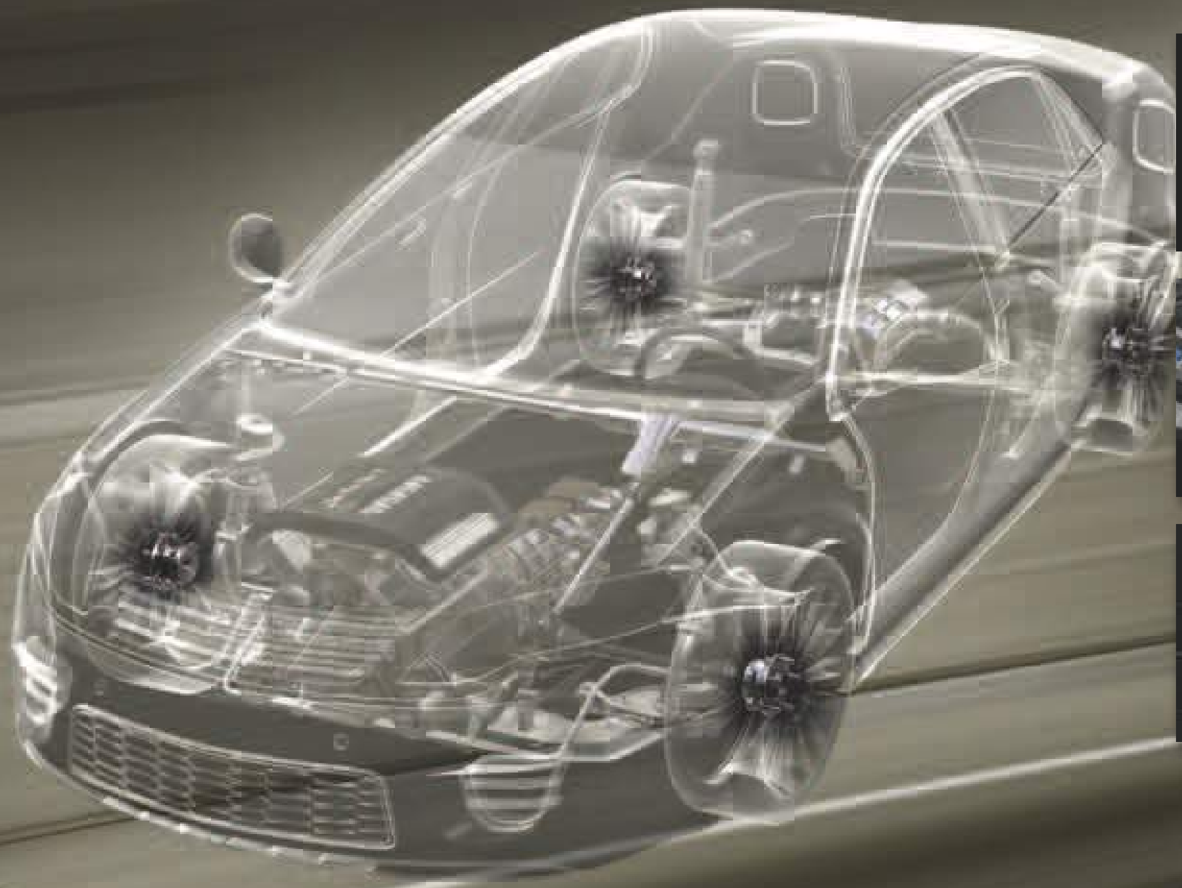
Refined Technologies and Products for Roads Worldwide Market leading and environment-friendly hub units contributing to vehicle performance and safety on roads worldwide

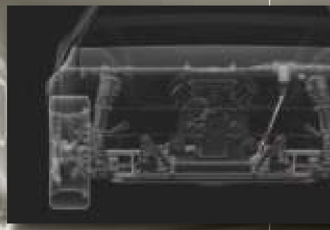
Hub Units - What they are and how they work

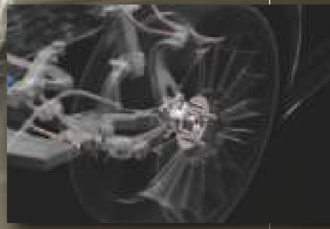
Hub units are wheel bearings combined with various peripheral parts, which in a single component play a vital role in supporting vehicle motion. JTEKT produces two types, both of which feature high precision and durability: one supports vehicle weight while delivering smooth rotation, and the other does that as well as assisting in the transmission of the driving force from the engine to the wheel. Beginning with the consideration of the car's overall construction to the environmental impact of our manufacturing techniques, JTEKT hub units are built to be lightweight with low rotating friction to enhance fuel efficiency, while maintaining the strength and rigidity that ensures optimal driving performance.

The 3rd generation

BALL HUB UNITS

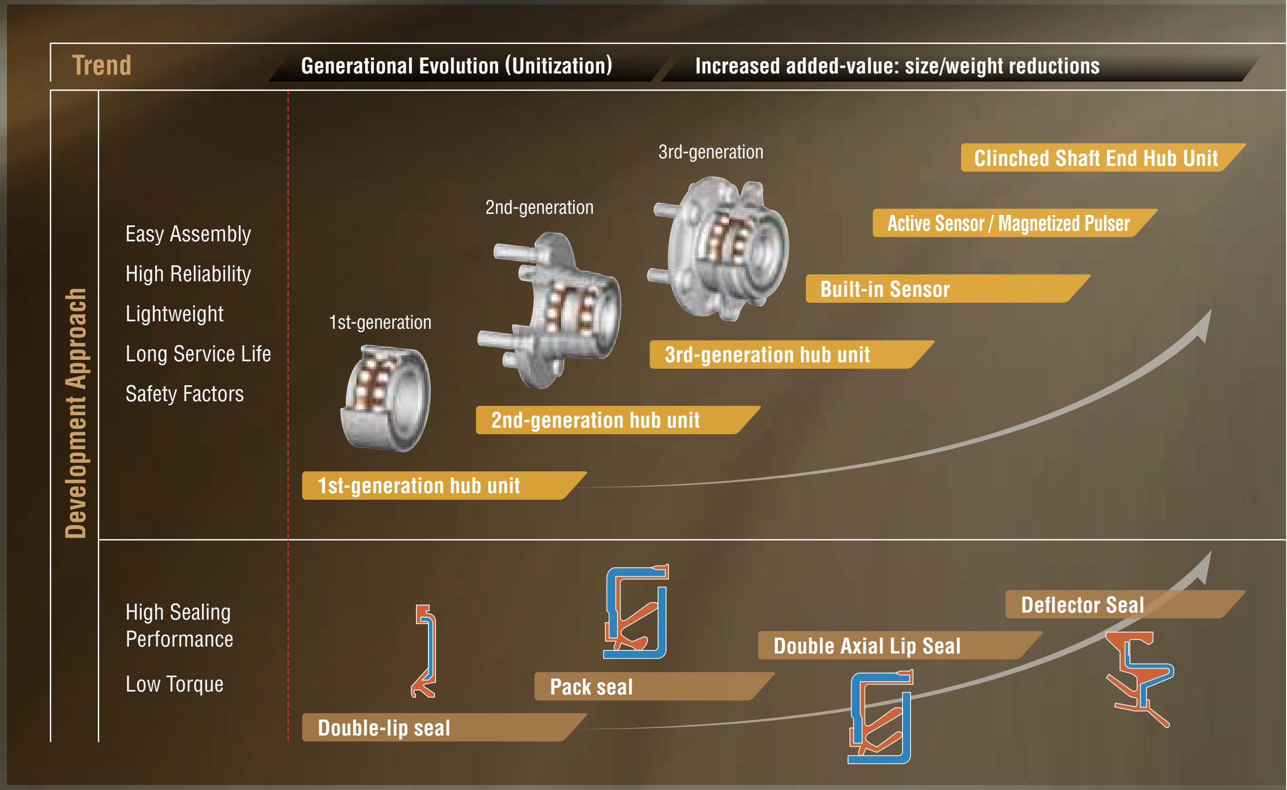






JTEKT hub units have evolved from the conventional 1st-generation design to the current advanced 3rd-generation configuration, which we most recommend to customers, by integrating flanges that facilitate their installation to vehicles.

1st-generation: Two single rows integrated into a double-row unit 2nd-generation: Integrated one flange on outer ring 3rd-generation: Also inner ring integrated with flange



Trend

Generational Evolution (Unitization)

Increased added-value: size/weight reductions

Development Approach

Easy Assembly

High Reliability

Lightweight

Long Service Life

Safety Factors

1st-generation

2nd-generation

3rd-generation

1st-generation hub unit

2nd-generation hub unit

3rd-generation hub unit

Built-in Sensor

Active Sensor / Magnetized Pulser

Clinched Shaft End Hub Unit

High Sealing Performance

Low Torque

Double-lip seal

Pack seal

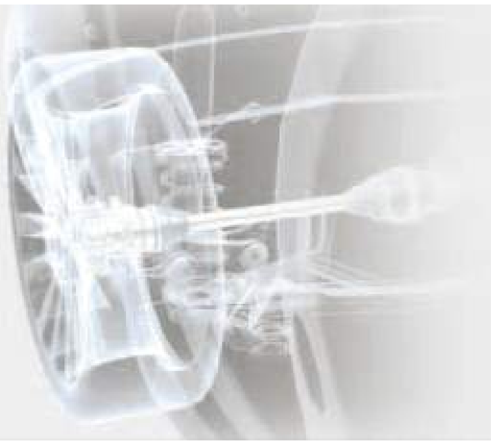
Double Axial Lip Seal

Deflector Seal

In parallel with the evolution of automobiles, JTEKT hub units have been widely adopted by not only automotive manufacturers in Japan, but manufacturers around the world.

JTEKT Hub Units Support Vehicles on Every Road around the World

Eco-friendly measures taken at all stages
— from initial design to manufacturing to daily driving

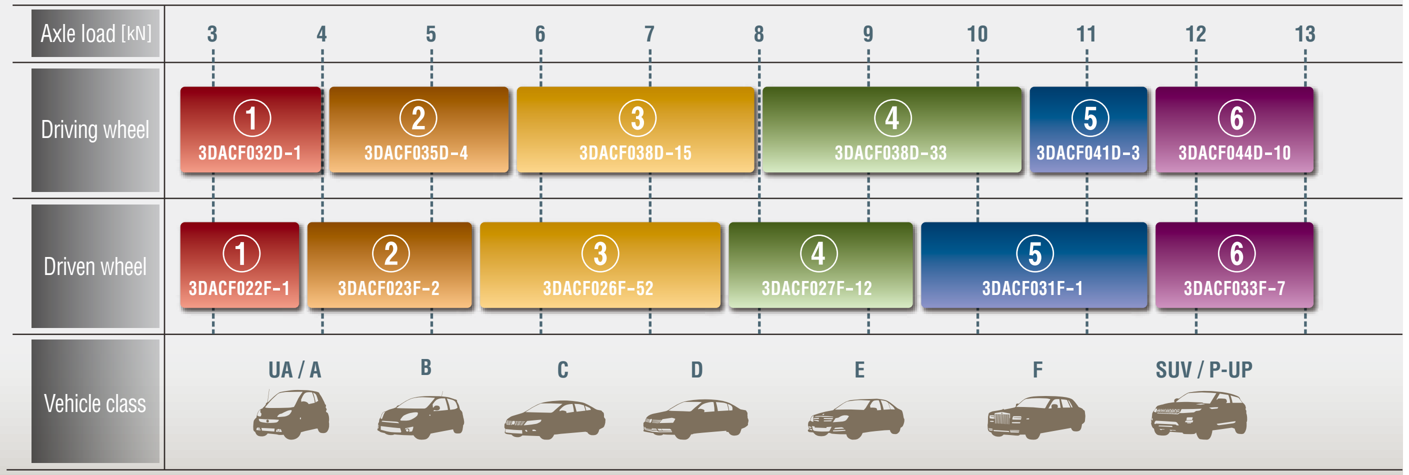


Hub Unit Recommendations

Features / Selection

Fuel Efficiency / Performance	Simultaneous achievement of weight reduction (= fuel efficiency) and increased strength/rigidity (= driving performance) at a high level
High Reliability	High reliability ensured, even in severe environments such as driving on muddy roads
High Capacity	High-capacity bearing design enabled by maximizing the use of allowable space
Recommended set-up	Recommended specifications are set according to vehicle segment (axle load)

Recommended hub units according to axle load



Axle load [kN]	3	4	5	6	7	8	9	10	11	12	13

	①	②	③	④	⑤	⑥
Driving wheel	3DACF032D-1	3DACF035D-4	3DACF038D-15	3DACF038D-33	3DACF041D-3	3DACF044D-10
Driven wheel	3DACF022F-1	3DACF023F-2	3DACF026F-52	3DACF027F-12	3DACF031F-1	3DACF033F-7

Vehicle class	UA / A	B	C	D	E	F	SUV / P-UP

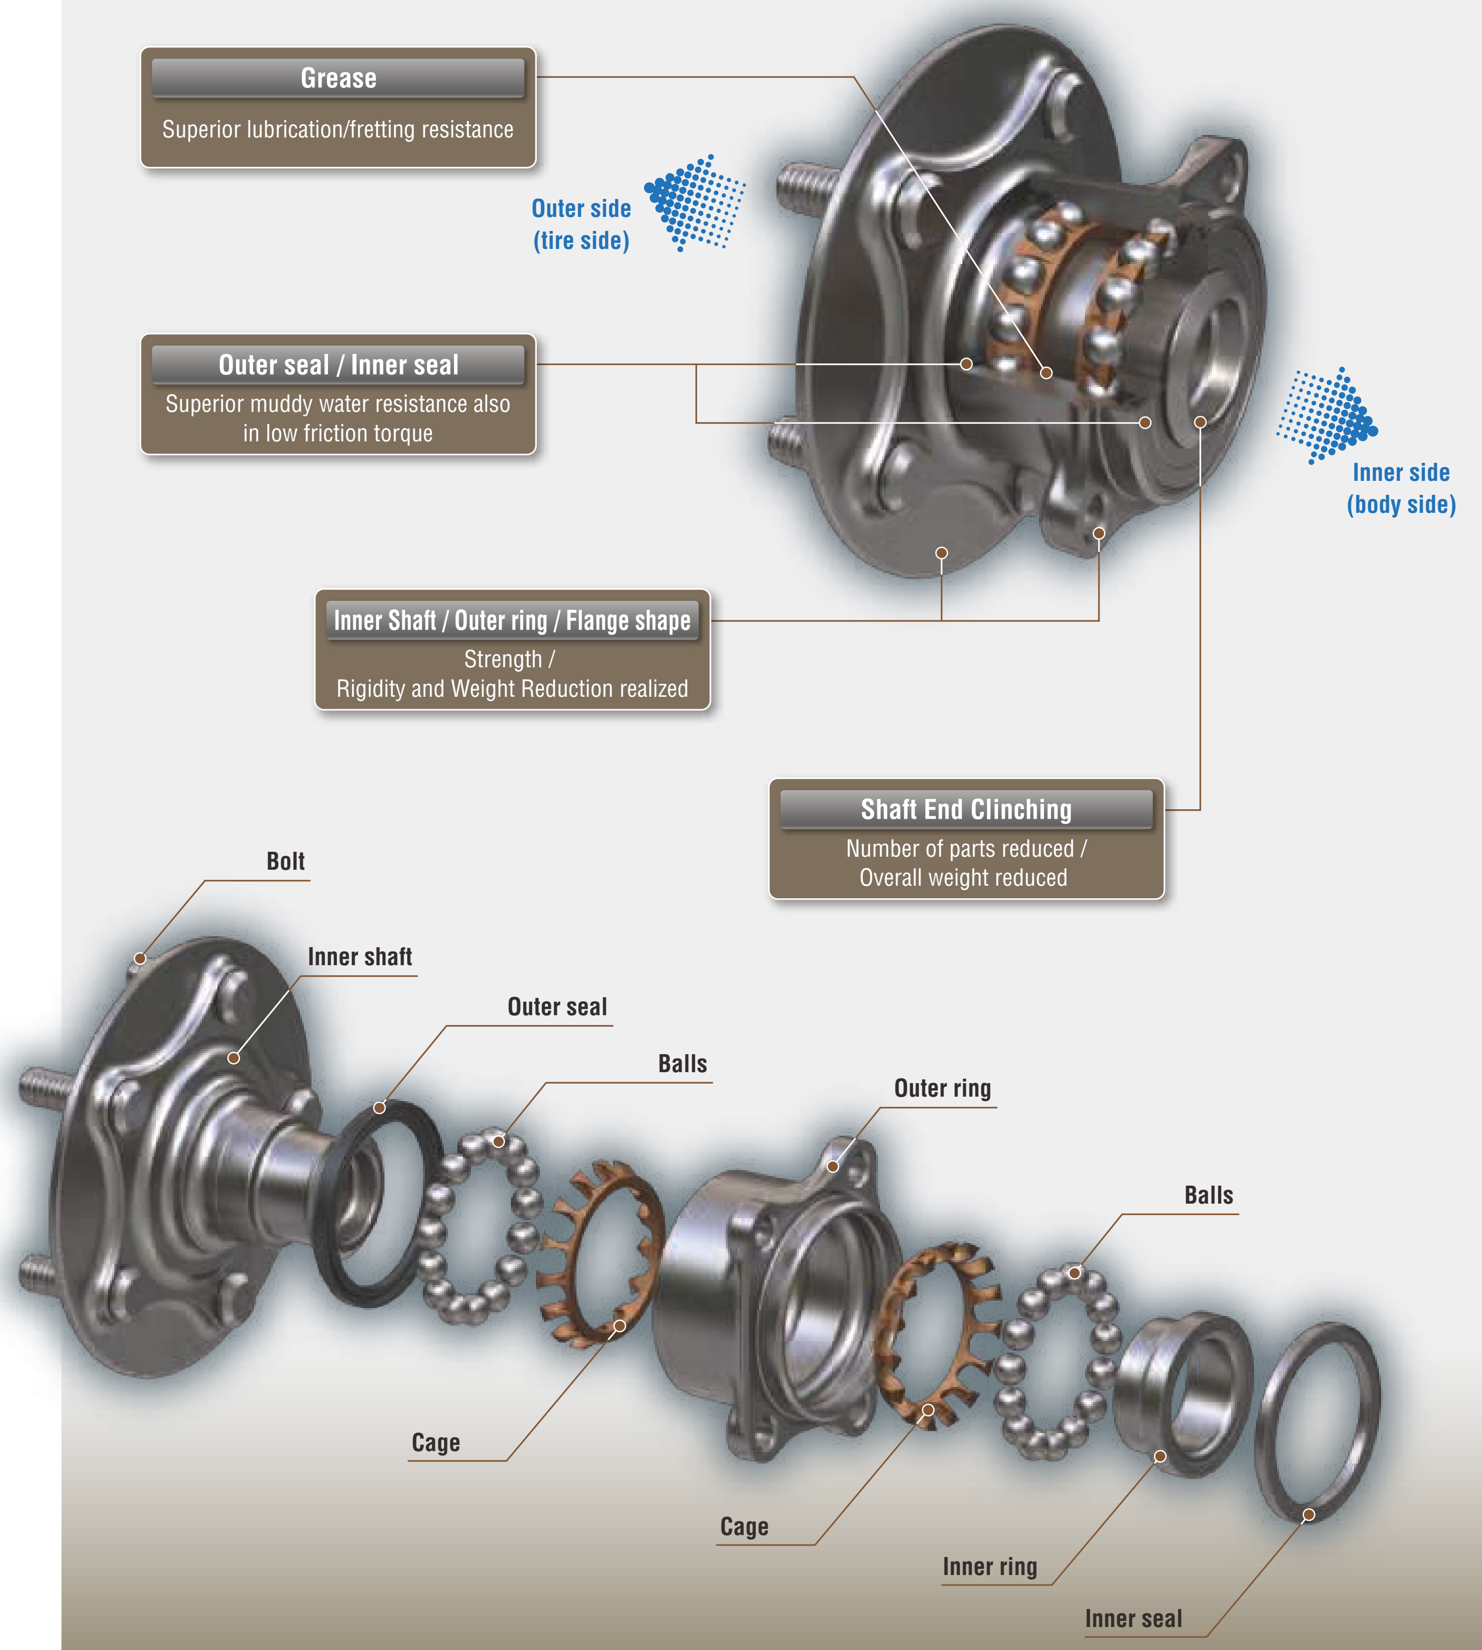
*Please use this table together with “Recommended hub unit numbers” on pages 9 and 10.

Modifications	The flange design can be modified to suit installations to customer’s vehicles

3rd-generation evolution

Structure

*Example: Hub unit for driving wheel



Grease
Superior lubrication/fretting resistance

Outer seal / Inner seal
Superior muddy water resistance also in low friction torque

Inner Shaft / Outer ring / Flange shape
Strength /
Rigidity and Weight Reduction realized

Shaft End Clinching
Number of parts reduced /
Overall weight reduced

Answering bearing performance / reliability needs

Materials Selection

Properties required for bearing ring / ball materials

High Reliability | **Excellent rolling fatigue life** | **High Abrasion Resistance**

JTEKT Hub Unit Materials

Use for hub unit bearings/structural parts ●: Yes - -: No

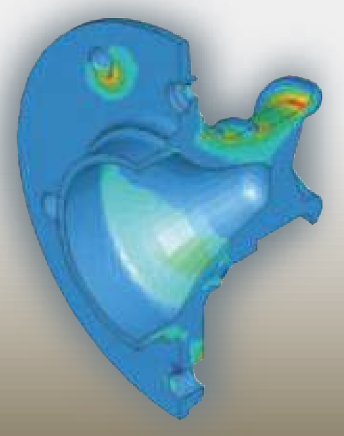
	Outer ring	Inner ring	Inner shaft	Ball	
Carbon steels for machine structural use	●	- -	●	- -	Carbon steel with good forging performance and high-frequency quenching of races. High-quality material with low non-metallic inclusions and superior characteristics not only in rolling fatigue service life, but also rotation bend fatigue strength and impact resistance.
High carbon chromium bearing steels	1st generation ●	●	- -	●	Most commonly used material for standard bearings; high quality with low non-metallic inclusions.

Simultaneous achievement of strength / rigidity and weight reduction

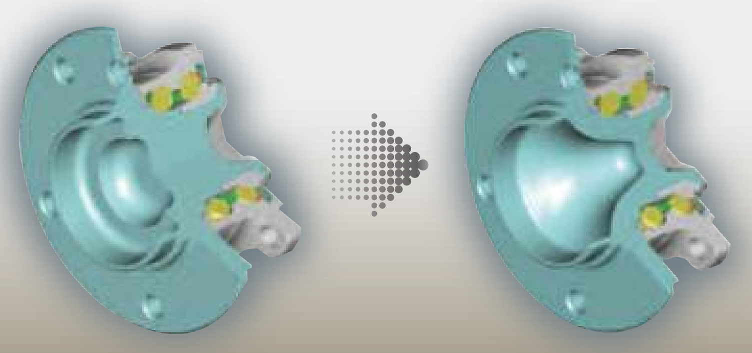
Inner Shaft / Outer Ring / Flange Shape

CAE analysis is used to obtain a design that achieves both of the seemingly contradictory goals of increased strength / rigidity and reduced weight.
Theoretical results are then verified with actual use on an original and rigorous test course developed by JTEKT.

[Example of inner shaft analysis]



[Example of assembled unit weight reduction]



Superior Lubrication / Fretting Resistance

Grease

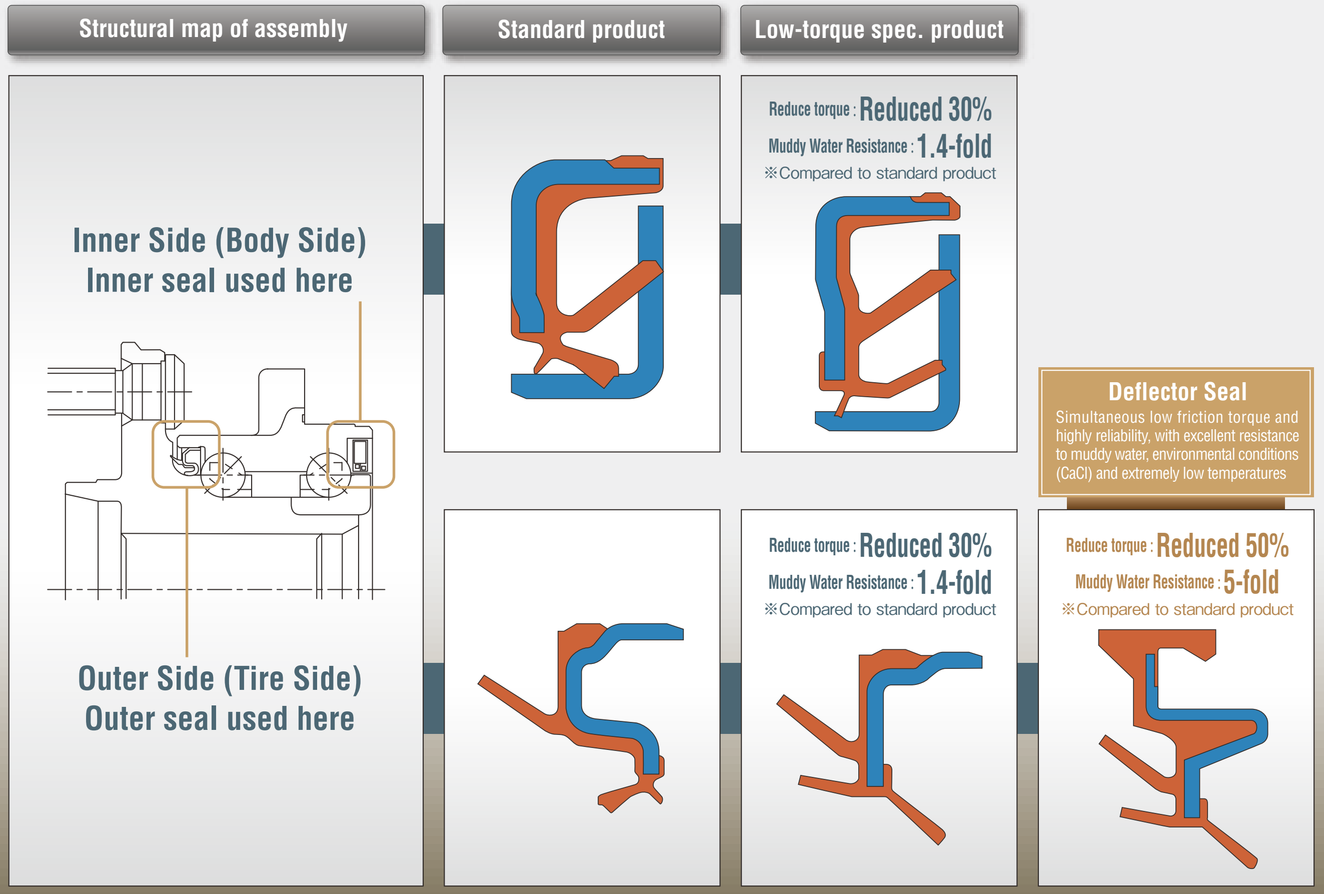
Grease is injected into the hub unit as a lubricant to maintain bearing function.
As standard, JTEKT uses grease with superior quick-acting lubricating performance and superior fretting resistance.

	Grease Service Life	Fretting Resistance	Seizure Resistance	Low friction torque	Operating Temperature Range
Conventional Product	★	★	★	★	0～150℃
Mineral-oil Urea Grease (standard)	★★★	★★★	★★★	★★★	-30～150℃

Superior muddy water resistance also in low friction torque

Outer Seal / Inner Seal

The seals are among the most important components supporting hub unit functions and their technical performance continues to increase in keeping with the evolution of the hub unit.
JTEKT seals ensure low friction torque and superior muddy water resistance.



Deflector Seal
Simultaneous low friction torque and highly reliability, with excellent resistance to muddy water, environmental conditions (CaCl) and extremely low temperatures

Number of Parts Reduced / Weight Reduced

Shaft End Clinching

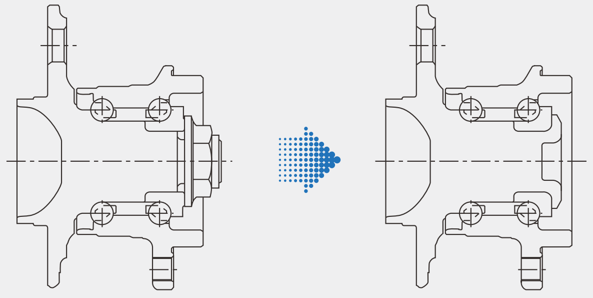
Fixed inner ring configuration proposed for 3rd-generation hub unit.

Hub Unit for Non-Driven Wheel

➔ Compared to the conventional nut fastening method, clinching the shaft end provides weight- and space-saving benefits.

Hub unit for Driven Wheel

➔ In addition to weight- and space-saving benefits, the need for torque management (axial force) of nut fastening at the time of installing unit in the vehicle is eliminated, thereby simplifying assembly.



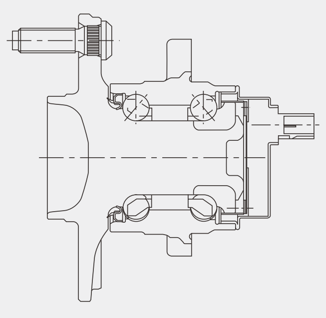
[Nut fastening] [Shaft End Clinching]

Assembly work simplified

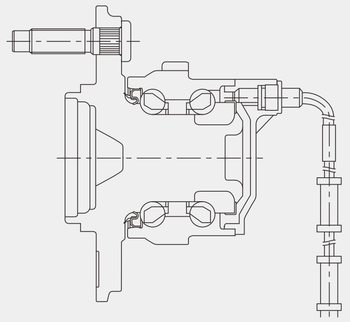
ABS Sensor (option)

JTEKT 3rd-generation hub units with built-in ABS sensor and magnetized pulser provide the following benefits.

- Space savings
- Controlled air gap for magnetized pulser and sensor
- Adhesion of foreign substances prevented; high ABS signal reliability



[Integrated sensor cover]



[Built-in stick-type sensor]

Magnetized pulser Changes in magnetic flux density accompanying wheel rotation are detected by a sensor and converted to wheel rpm.

The magnetized pulser is a multipolar magnet applied to a pulser ring: a rubber composite is filled with magnetic material and then segments are alternately magnetized with North and South poles, taking the bearing rotation shaft as the point of origin. Using the magnetized pulser enables more reliable detection of wheel speed.

Iga Proving Ground Enables Testing / Evaluations Simulating Roads Worldwide

Fully utilizing our knowledge as a world-leading systems supplier, JTEKT conducts driving evaluations and analyses of products installed in vehicles. We exhaustively pursue the highest standards in product safety and operation on a test course capable of simulating various road and weather conditions around the world. As a total systems supplier, our highest value is to provide our customers with products that deliver outstanding performance and the best quality that help to make automobiles that are more than just fun to drive.

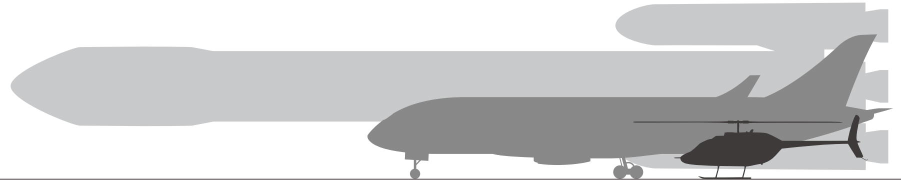
CAT.NO.B1003JE-1

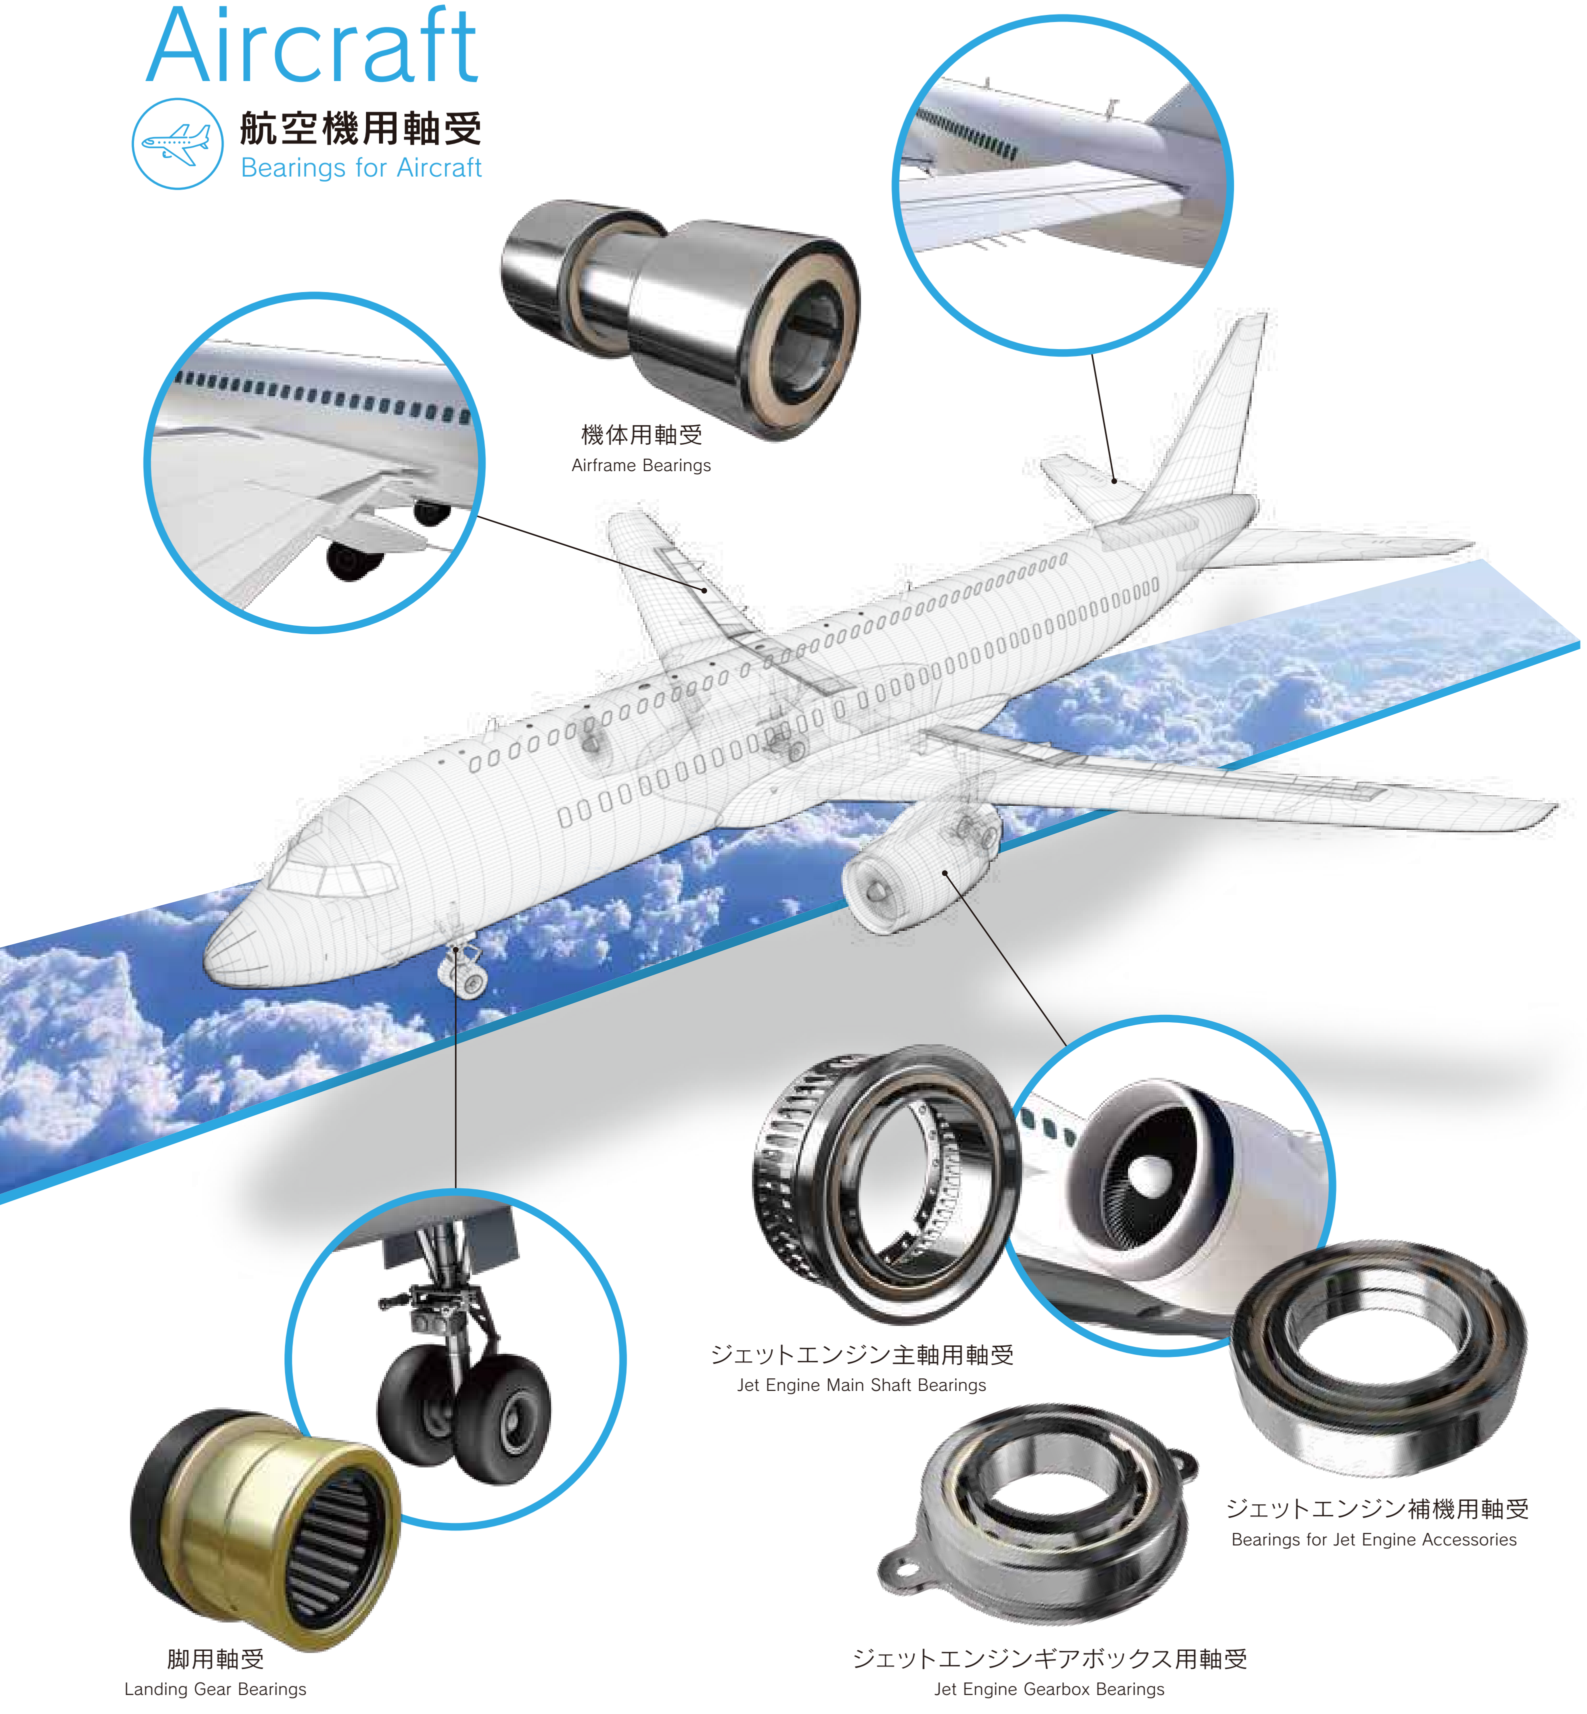
航空機やヘリコプタで使用される軸受には、高い信頼性とともに長寿命化、及び軽量化等、
最新の技術が必要とされる中、KOYOブランドの軸受は多くのアプリケーションで貢献しています。

Bearings for aircraft and helicopter applications require the latest technologies to ensure high reliability, long life, and light weight.
This is why KOYO brand bearings are used for numerous applications.



Aircraft

航空機用軸受
Bearings for Aircraft

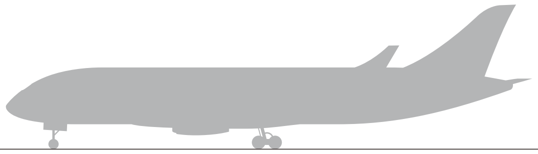


Helicopter

ヘリコプタ用軸受
Bearings for Helicopters

Aircraft

航空機用軸受
Bearings for Aircraft



ジェットエンジン主軸用軸受
Jet Engine Main Shaft Bearings

ジェットエンジン主軸用軸受は、航空機の心臓部を支える重要な機械部品です。
絶対的な信頼性を確保するため、厳重な工程管理の下で製造されています。

The main shaft bearings of a jet engine are critical mechanical components supporting the aircraft' s engine, essentially the heart of the aircraft.
In order to secure absolute reliability, these bearings are manufactured according to strict process control.

特長 Features

高温用特殊鋼 Special steel for high-temperature use	優れた耐熱性を有し、高温下でも高硬度 With excellent heat resistance and high hardness even under high temperatures
真空再溶解鋼(VIM-VAR) Vacuum arc re-melted steel (VIM-VAR)	材料の清浄度向上により長寿命・高信頼性を実現 Realization of long service life and high reliability by improving cleanliness of material
浸炭処理による表面硬化 Surface hardened using carburizing process	異物混入時の耐久性向上 Improved contamination resistance
スクイズフィルムダンパーやビームを持つ With squeeze film damper and beam	軸の振動を軽減 Reduction of shaft oscillation

ジェットエンジンギアボックス用軸受
Jet Engine Gearbox Bearings

スタータやポンプなど様々なアクセサリーが取り付くギアボックスには
高温高速条件下で長期間安定した性能を維持する軸受が求められています。

Gearboxes mounted with various accessories such as starters and pumps require bearings capable of maintaining stable performance for long periods of time at high temperatures and high speeds.

特長 Features

フランジ付外輪 Outer ring with flange	位置決め容易、組込性向上、軽量化 Easy positioning, simple installation, compact
内輪と外輪の差幅管理 Inner- and outer-ring width difference control	ギアの歯当り調整の簡素化 Simplification of gear tooth contact adjustment
真空再溶解鋼(VIM-VAR) Vacuum arc re-melted steel (VIM-VAR)	材料の清浄度向上により長寿命・高信頼性を実現 Realization of long service life and high reliability by improving cleanliness of material

ジェットエンジン補機用軸受
Bearings for Jet Engine Accessories

エンジン後方のアフタバーナ部や、エンジン主軸とギアボックスを繋ぐPTOやRDS等、
主軸やギアボックス以外の回転部にも軸受が使われています。(PTO:Power Take Off／RDS:Radial Drive Shaft)

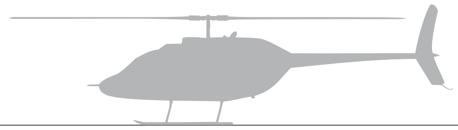
Bearings are used for rotating parts other than the main shaft and gearbox.
Some examples include the afterburner at the rear of the engine,
the PTO and RDS that connect the engine' s main shaft and gearbox, etc. (PTO:Power Take Off／RDS:Radial Drive Shaft)

特長 Features

内輪と外輪の差幅管理 Inner- and outer-ring width difference control	ギアの歯当り調整の簡素化 Simplification of gear tooth contact adjustment
真空再溶解鋼(VIM-VAR) Vacuum arc re-melted steel (VIM-VAR)	材料の清浄度向上により長寿命・高信頼性を実現 Realization of long service life and high reliability by improving cleanliness of material
特殊合金 Special alloy	高温環境下で無潤滑でも使用可能 Able to be used even without lubricant at high temperatures
特殊表面処理 Special surface treatment	金属表面の硬度向上により耐久性向上 Improved durability due to higher metal surface hardness

Helicopter

ヘリコプタ用軸受
Bearings for Helicopters



ヘリコプタ トランスミッション用軸受
Helicopter Transmission Bearings

トランスミッション用軸受は、エンジンからの動力を各部に伝達するための
ギアの支持に使用されています。ヘリコプタの核となる部位を支持するため
高い信頼性を有しています。

Transmission bearings are used to support gears that transmit power from the engine to various areas.
They must be highly reliable as they support the core operations of the helicopter.

特長 Features

ドライラン性能 Dry-run performance	オイル遮断後も長時間の運転可能 Can be operated for a long time even after oil supply is isolated
油穴付内輪 Inner ring with oil hole	アンダーレース潤滑により軸を冷やし、すきま詰まりを抑制 Cools shaft using under-race lubrication and minimizes gap blockage
内輪と外輪の差幅管理 Inner- and outer-ring width difference control	ギアの歯当り調整の簡素化 Simplification of gear tooth contact adjustment
真空再溶解鋼(VIM-VAR) Vacuum arc re-melted steel (VIM-VAR)	材料の清浄度向上により長寿命・高信頼性を実現 Realization of long service life and high reliability by improving cleanliness of material

ヘリコプタ スワッシュプレート用軸受
Helicopter Swash Plate Bearings

操縦桿からの指示によりブレードのピッチ角をコントロールし、浮力調整や
水平移動等ヘリコプタの動きを司る部分に使用されるスワッシュプレート用軸受は、
コンパクトかつ高容量の軸受です。

According to commands from the control stick, the swash plate controls blade pitch angle and movement of the helicopter, such as buoyancy adjustment and horizontal movement.
The bearings used in swash plates are compact, yet have high capacity.

特長 Features

大径かつ薄肉 Large diameter but thin	軽量化を実現 Realizing lighter weight
ワイヤ保持器を採用 Wire cage used	玉数を増やし負荷容量向上 Load capacity increases when using more balls.
グリース潤滑品 Grease lubricated product	環境にも優しく、外輪に設けた穴から容易に給脂可能 Environment-friendly operation by easily supplying oil through a hole in the outer ring

Aircraft Helicopter

機体用軸受
Airframe Bearings

ビジネスジェットや商用機などの多岐にわたる用途をカバーし、フラップ＆スラット用（トラックローラ）、可動式水平尾翼アクチュエータ用（スラスト軸受）、昇操舵（自動調心軸受）、乗客ドアロック用（トラックローラ）、エアコン（コンバインド軸受）など、豊富なラインナップを有しています。

Covering a broad range of uses including private jets and commercial airliners,
JTEKT has a large lineup of bearings, such as those for flaps and struts (track rollers), movable horizontal tail actuators (thrust bearings), elevating steering (self-aligning bearings), passenger door locks (track rollers), and air conditioning (combined bearings).

特長 Features

総玉･総ころ軸受の採用 → 高負荷容量への対応
Full complement type ball/ Full complement type roller bearings incorporated → Supports high-load capacity

高性能浸炭ステンレス鋼の採用 → 高強度、高耐食性
High-performance, carburized stainless steel incorporated → High strength, high corrosion resistance

軌道輪への特殊なめっき処理 → 耐食性の向上
Special plating for bearing rings → Improved corrosion resistance

テフロン樹脂性シール採用 → 広範囲な温度領域で使用可能
Adoption of a Teflon resin seal → Able to be used over a wide temperature range

脚用軸受
Landing Gear Bearings

航空機の脚用軸受は、急加速、衝撃荷重など厳しい条件下で使用されています。

Aircraft landing gear bearings are under severe conditions such as sudden acceleration when taking off and impact load when landing.

特長 Features

内外輪で互換性を有する → メンテナンスが容易
Inner-/Outer-ring compatibility → Simple maintenance

はだ焼鋼の採用 → 高強度、衝撃に強い
Case-hardened steel incorporated → High strength, strong against impact

高清浄度鋼の採用 → 材料の清浄度向上により長寿命・高信頼性を実現
Extremely-clean steal incorporated → Realization of long service life and high reliability by improving cleanliness of material

Outer Space

宇宙機器用軸受
Bearings for Devices Used in Outer Space

宇宙機器用軸受
Bearings for Devices Used in Outer Space

高真空、広範囲な温度領域、放射線環境など地上とは異なる厳しい環境である宇宙で使用出来る特殊な材料技術、トライボロジー技術を組み合わせた軸受を提供致します。

In the field of space development, JTEKT offers bearings manufactured by combining special materials technologies and tribology technology to make them appropriate for use in space where the harsh environment differs from that on Earth, including factors such as a high vacuum, wide temperature variations and high radiation.

特長 Features

高耐食鋼 → 地上での長期保管可能
High corrosion-resistant steel → Suited for long-term, terrestrial storage

真空用特殊グリース → 高真空、高速環境でも使用可能
Special vacuum grease → Able to be used in high-vacuum, high-speed environments

固体潤滑剤 → 広範囲な温度領域で使用可能
Solid lubricant → Able to be used in wide temperature ranges

Aerospace

テクノロジーマネジメント
Technology Management

航空機のための、究極の安心・信頼をお届けすることが、私たちのミッションです。
設計・解析から生産・加工、検査・測定、評価までをトータルマネジメントすることにより、
航空機用軸受の技術・品質を日々向上させています。

Delivering superior reassurance and reliability for aircraft is our mission.
To improve the manufacturing techniques and quality of aircraft bearings, we use total management, from design and analysis to production, processing, inspection, measurement and evaluation.

設計・解析
Design and Analysis

高度な流体解析や、振動モード解析、応力解析による結果を設計にフィードバックし、高性能を実現します。実際の運転状態を再現する解析プログラムを活用し、短期間で精度の高い設計を実現します。

High performance achieved by feeding back the results obtained from sophisticated fluid analysis, vibration mode analysis and stress analysis during design.
Utilizing an analysis program that recreates actual operating conditions, highly accurate design is realized in a short time.

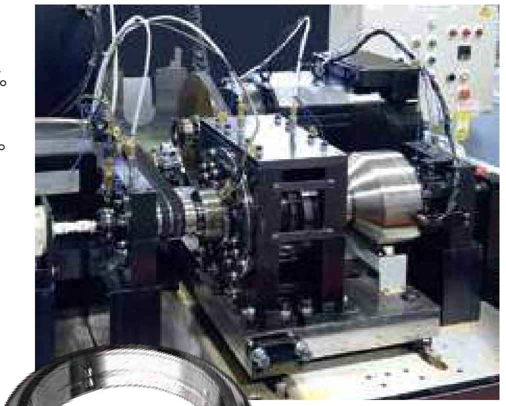
評価
Evaluation

信頼性の高い製品開発と航空機の安全を支えるために、実際の使用条件を再現した評価で、製品の性能を十分に確認します。

内輪も外輪も回転するのが差動ベアリング。超高速で回転する2つの異なる動きからさまざまなデータを測定するために、その試験設備は極めて複雑なものとなり、その開発には高度な技術が求められます。ジェイテクトはこの差動ベアリング試験設備を自社開発。試験結果から得られるデータを、より高次元の開発や改善へとつなげています。

To support highly reliable product development and aircraft safety, actual use conditions are reproduced to thoroughly check and evaluate product performance.

Both the inner and outer rings of differential-motion bearings rotate. In order to measure the different data from the two rings, which both rotate at ultrahigh speeds, an extremely complex testing apparatus is required. Using highly advanced technologies, JTEKT Corporation has succeeded in developing such an apparatus, enabling the company to use data from test results to enhance bearing development and make ongoing improvements.



差動ベアリング試験設備

Products for Wind Turbine Generators

JTEKT

JTEKT CORPORATION

JTEKT
Koyo TOYODA

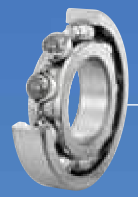
CAT. NO. B1002E-4

For the Environment…

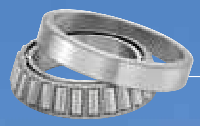
Wind turbine generators efficiently turn one of the elemental forces of Nature into a stable supply of electric power. JTEKT has used their 90+ years of friction management experience to developing world leading bearing, sealing and other technologies to the rapidly advancing field of renewable power generation thus enabling Wind Turbines to achieve an operation life of 25 years or more.

Main shaft bearings

Gearbox bearings



Generator bearings



Products for
peripheral equipment

Main shaft bearings

Main shaft bearings of various types and sizes are required to support the diverse wind turbine designs and the ever increasing size of both onshore and offshore wind turbines.
JTEKT is committed to answering the needs of its customers through high reliability and speedy development.

(Main shaft: An important component that supports the wind load applied by the blades and transfers the rotational torque to the gearbox.)

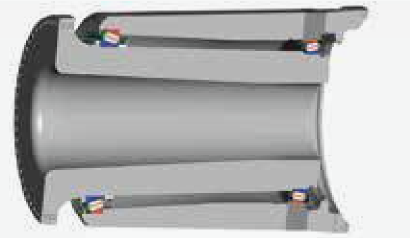
Tapered roller bearings

Supporting market demands for smaller, lighter and more reliable bearings, JTEKT is leveraging new technologies to develop and mass produce industry leading tapered roller bearings.

- **Utilizing advanced roller movement stabilizing technology in our spherical roller bearings and low-torque design technology of tapered roller bearings JTEKT has extended the service life of the main shaft bearing grease by reducing bearing temperature increases.**

Spherical roller bearings

FEM analysis model



Main shaft configuration

At JTEKT' s Kokubu Large-Size Bearing Engineering Development Center, we have validated our FEM analysis results with full size test equipment. This allows us to confidently optimize the internal and external geometry of the bearings based on the mathematical analyses of the entire Wind Turbine drivetrain and structure.

Certified by DNV-GL*

The high quality of JTEKT bearing materials has been evaluated and consequently received certified approval from DNV-GL to increase our published load ratings by 25%. This allows for more accurate life predictions and the confidence to use optimally sizes bearings.

* Certification acquired November 2015

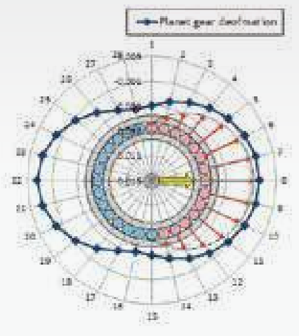
Large-Size Bearing Engineering Development Center

A new testing facility has been installed in our Large-Size Bearing Engineering Development Center to evaluate actual wind turbine drivetrains allowing for higher reliability and shorter customer development periods.

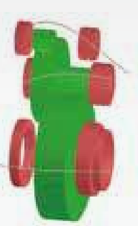
JTEKT' s proprietary Shaft System Analysis Program

In addition to analytical techniques such as FEM, JTEKT has developed a bearing analysis system that enables detailed calculations of bearing life considering rigidity of peripheral components and lubrication conditions during operation. With this system, reliable and speedy technical verification is possible, thereby ensuring optimal bearing selection.

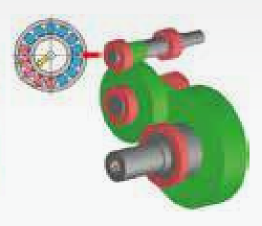
Shaft System Analysis
Program model of a wind turbine drivetrain.



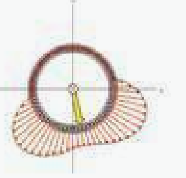
Planetary gear bore deformation and load distribution



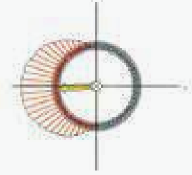
Shaft deflection



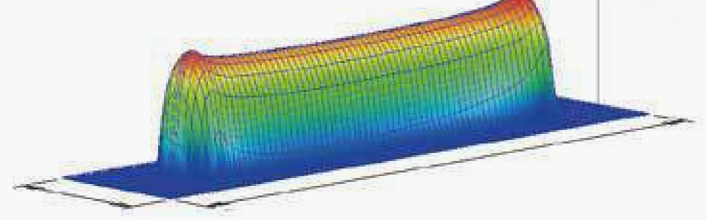
Rolling element load distribution



Main shaft bearing
rolling element load distribution
(front)



Main shaft bearing
rolling element load distribution
(rear)



Contact stress distribution between roller and raceway

Gearbox bearings

Gearbox bearings vary greatly in regards to type, load capacity and rotational speed depending on where they are used in the gear train.
JTEKT responds to diversified customer requests by ensuring optimal designs based on strict calculations.

(Gearbox: Mechanism that increases the rotational speed transmitted via the main shaft up to a speed where electric power can be generated.)

Responding to market needs, JTEKT uses special carburized steel and surface treatments help us to achieve higher reliability under severe lubrication conditions and high-rotational speed variations.

double-row cylindrical roller bearing for planetary gear

double row tapered roller bearing with integrated planet gear

Bearing with special surface treatment minimize roller slippage and improves lubricity

Generator bearings

Electric pitting is a common cause of bearing failures in wind turbine generators due to stray electrical currents.
Insulated ceramic bearings eliminate electrolytic corrosion (commonly called fluting)and extend bearing life.

(Generator: The device that converts rotational energy into electrical energy.)

Insulated (hybrid) ceramic bearing

Rolling elements in insulated ceramic bearings are made from silicon nitride ceramic (Si_3N_4)
JTEKT was the first company in the world to develop and install insulated hybrid ceramic bearings in Wind Turbines.
The use of hybrid ceramic bearings contributes to the reduction of maintenance costs and improves operating efficiency.

Characteristic		Silicon nitride	High carbon chromium (bearing steel)
Heat resistance	℃	800	180
Density	g/cm³	3.2	7.8
Coefficient of linear expansion	1/℃	3.2×10^{-6}	12.5×10^{-6}
Vicker's hardness	Hv	1300 to 2000	700 to 800
Young' s modulus	GPa	310	210
Poisson's ratio		0.29	0.3
Magnetic property		Nonmagnetic	Magnetic
Electrical Conductivity		Insulator	Conductor
Material type		Covalent bond	Metallic bond

Comparison of ceramics and bearing steel properties

Eliminates electric corrosion and extends grease life

Compared to bearings with ceramic coated outer rings, hybrid ceramic bearings are not susceptible to insulation degradation due to handling damage. Additionally, ceramic balls lower the operating temperature of the bearings; extending both grease and bearing life.

All steel bearing with electric corrosion
Steel bearing inner ring with fluting damage

Products for peripheral equipment

Bearings for yaw-drives

JTEKT supplies optimally designed tapered roller bearings and needle roller bearings that simultaneously provide high reliability and rigidity needed to withstand extreme wind gusts.

Technology to improve bearing robustness	
Larger rolling element design (R-type design)	Rated capacity improved **1.1 to 1.2 times**
Special heat treatment (KE treatment, SH treatment)	Fatigue life more than **doubled**
Optimized crowning	**Improved life under misalignment conditions**

Main Shaft Oil Seals

Full rubber seals (MS-type and MSA-type)

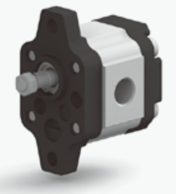
- Full rubber material makes installation easy
- Split MS-type seals also available as replacement
- MSA-type with dust lip available for environments with excessive dust

HPI Hydraulic Pumps

HPI hydraulic pumps are highly efficient, lightweight and compact.
They also have a long life and high reliability.

Hydraulic pump for pitch brakes

Used for pitch brake hydraulic power units.
The hydraulic power unit reduces the rotor speed using a disc similar to the way disc brakes are used to slow down an automobile.



Series 0

Model	Capacity (cc/rev)	Peak pressure (MPa)
0025	0.25	28.0
0050	0.5	28.0
0075	0.75	25.0
0100	1	25.0
0125	1.25	20.0
0150	1.5	15.0
0200	2	12.5

Hydraulic pump for pitch controllers

Hydraulic power is used to change blade pitch angle to insure operation at the turbine's rated speed.

Series 1

Model	Capacity (cc/rev)	Peak pressure (MPa)
1001	1.02	30.0
1002	2.05	30.0
1003	3.07	30.0
1004	4.09	25.0
1005	5.12	20.0
1006	6.14	15.0

Note: The body is made of aluminum alloy.
The photographs are for reference only.

Machine Tools

JTEKT also manufactures high performance Toyoda machining centers for the production gear boxes and other large wind power components.
Large, Fast and Strong – Top of the class in all three areas
Optimal horizontal machining center for large-size parts machining

FH1250SX
Large horizontal machining center

Quick rapid feed rate of 42m/min, fastest in its class

Max. workpiece range: Φ 2,400 x 1,800mm
Pallet load capacity: 5,000kg
Pallet size: 1,250 x 1,250mm
Large-torque spindle: 8,000min⁻¹
Max. spindle torque: 1,009N·m

FH1600SW5i
Large horizontal machining center

Equipped with TOYOPUC-Touch, a new CNC incorporating smartphone-inspired operability

Max. workpiece range: Φ 3,200 x 2,200mm
High-rigidity quill spindle: Φ 150mm quill, Φ 200mm high-rigidity bearing

Miniature One-way Clutch

We can provide you with various types of miniature one-way clutches, both high- and low-load types with shaft diameters between 4 mm and 12 mm, based on our highly advanced technical know-how and abundant experience.

Features

- Creation of detent protrusions over the surface of the outer-race diameter prevents creeping without strict setting of dimensional tolerance over the engaged surfaces.
- Prefilled optimal grease eliminates replenishment of oil and grease in normal operating conditions.
- Preassembled integrated modules made of synthetic-resin housing and one-way clutch are available. Custom design for various items such as gears, timing pulleys, cams, and rubber rollers are also available. Please contact JTEKT.

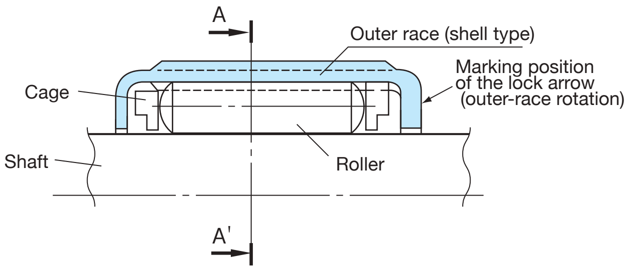
Structure and principles

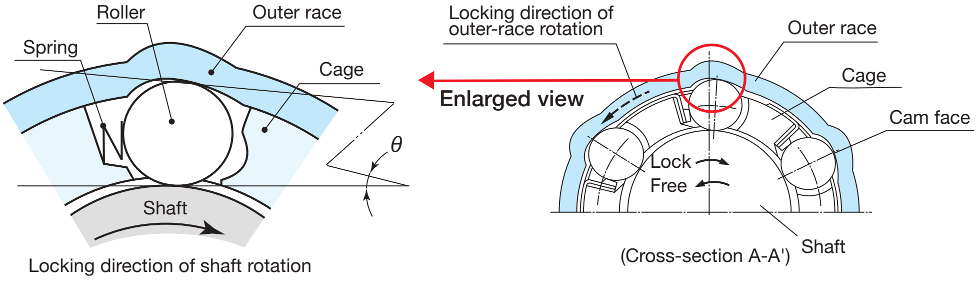
Clutch engagement

Clockwise shaft rotation at the cross-section A-A' presses the roller on the cam surface of the outer race, locking the cam surface and the shaft by wedge action and driving the outer race.

Clutch disengagement

Counterclockwise shaft rotation at the cross-section A-A' detaches the roller from the cam surface of the outer race and allows rotation of the shaft without driving the outer race.



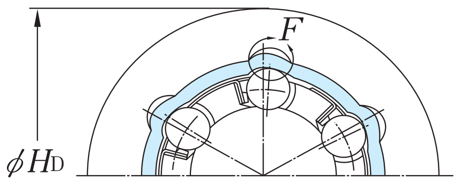


Types and characteristics

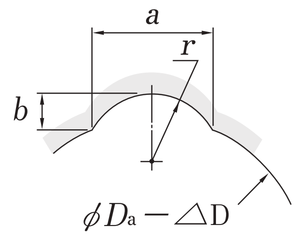
	EWC series (with synthetic resin spring)		1WC series (with metal spring)
	High-load type	Low-load type	Torque capacity
	EWC･･･C	EWC･･･A	1WC
Torque capacity	High load	Low load	High load
Operating temperature range	−10～+70℃		−10～+90℃
Lock life	More than 1 million lock times (subject to torque capacity not exceeding the one described in the specifications and dimensions)		
Insert molding	Not available		Available

Housing dimensions and accuracy

Tolerances of housing dimensions and accuracy depend on the materials and wall thickness. So, please consult JTEKT.
The following table shows the interference for polyacetal housing and steel housing (⊿D). The recommended plane roughness for steel housing inside diameter is 6S.



Housing shape



Enlarged section F

Shaft dimensional tolerances and accuracy

In general, an inner race is not used; instead, the shaft functions as a bearing ring. Therefore, to fully demonstrate the clutch functions, the following dimensional tolerances and accuracies must be satisfied.

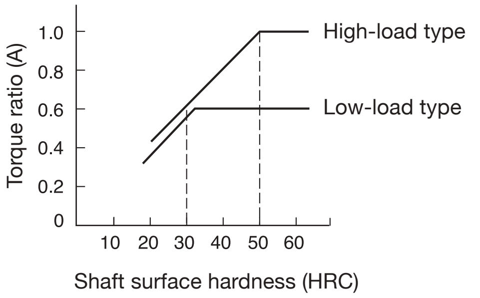
	High-load type (EWC･･･C, 1WC･･･)	Low-load type (EWC･･･A)
Shaft tolerance zone class	h8	
Surface hardness	50 HRC or more	30 HRC or more
Surface roughness (Ra)	0.3a or less	0.8a or less
Circularity and cylindricity	0.005 mm or less	

1) Shaft diameter dimensional tolerance in case clutch engagement accuracy is not required or no radial load and moment are applied:
- Shaft diameter 6 mm or less and EWC0809: 0 to 0.040 mm
- Shaft diameter 8 mm or more (except EWC0809): h10

2) Surface hardness in case that load torque is smaller than torque capacity.
- The chart to the right shows the target value of shaft surface hardness against torque ratio (A).

Where:

$$\text{Torque ratio (A)} = \frac{\text{load torque}}{\text{torque capacity of high-load type}}$$



Model series and dimensions

New Development / New Product

New Ceramic Ball Bearings for Electric Motors

EXSEV

Our newly developed, first in Japan ceramic material makes ceramic bearings available for more applications.

Ceramic rolling elements prevent electrical pitting in bearings for electric motors

- Our newly developed ceramic has only a slight difference in linear expansion coefficient(※) from the inner and outer ring material (bearing steel SUJ2), thus creating minimal internal clearances due to temperature change, allowing ceramic bearing use in an environment with a wide range of temperatures.

※Change in a material's length in response to a change in temperature of 1 degree Celsius.

- Our newly developed ceramic has similar insulation properties, strength, and durability (little change in acoustic value) with conventional silicon nitride material (Si_3N_4). (See the table below for details.)

■ Material properties

	New ceramic	Bearing steel (SUJ2)	Standard ceramic (Si_3N_4)
Density (g/cm^3)	6	7.8	3.2
Linear expansion coefficient (1/°C)	10.5×10^{-6}	12.5×10^{-6}	3.2×10^{-6}
Vickers hardness (HV)	1280	750	1500
Module of longitudinal elasticity (GPa)	210	208	320
Poisson's ratio	0.31	0.30	0.29
3-point bending strength (MPa)	1200	–	1100
Fracture toughness ($MPa\cdot m^{1/2}$)	5～6	–	6
Conductivity	Insulator	Conductor	Insulator

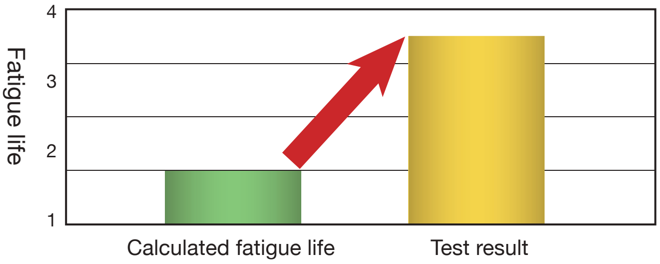
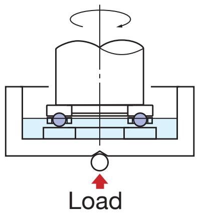
Rolling fatigue life evaluation results

More than 3 times longer than calculated fatigue life



Test equipment

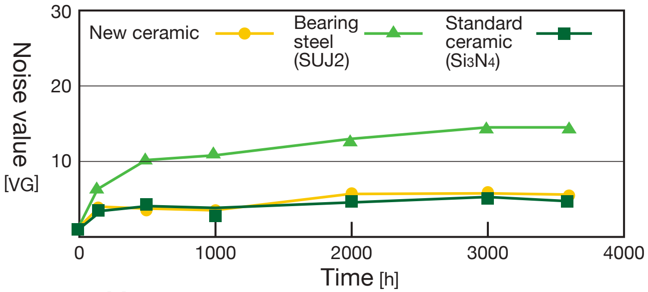


Test conditions

Contact stress	4.2 GPa
Lubrication	Oil bath

High-temperature Noise comparison test results

Noise comparison test results (150°C)

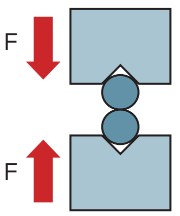


Test conditions

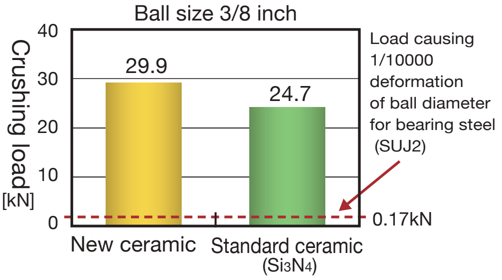
Lubrication	KVC (urea-based grease)
Ambient temperature	Outer ring temperature 150°C
Load	Fa=0.16kN
Rotational speed	3000 min^{-1}
Calculated grease life	3600 h
Test duration	3600 h

No significant deterioration of the acoustic value of our new ceramic after 3600 hours

Crushing load test



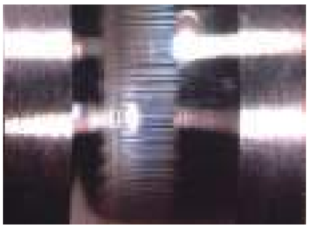
Schematic of crushing load test

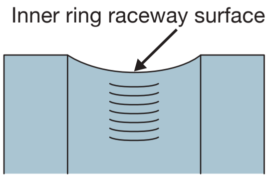


Crushing load test results

This new ceramic has strength equivalent to conventional silicon nitride ceramic (Si_3N_4).

Wave-like wear by electrical pitting





【Electrical pitting】

Due to the nature of electric motors, harmful voltage is generated by high-frequency current during operation, and above a certain voltage can produce arcing between the bearing raceway surface and rolling elements. Electrical pitting occurs when a surface in rolling contact is locally melted due to the arcing, reducing bearing service life. To avoid such pitting, using an insulating ceramic rolling element is one of the most reliable solutions. Our newly developed ceramic has insulation properties equivalent to those of conventional silicon nitride ceramic (Si_3N_4).

Applications

- Inverter motors
- Fan motors

Development and Manufacturing Facilities

By continuously incorporating new improvements, Koyo *EXSEV* Bearings and Ceramic Bearings are applicable in more technologies than ever.

Technologies are advancing rapidly and bearings are required to satisfy more complicated and varied requirements under increasingly hostile operating conditions.

In response to such needs, JTEKT is committed to the development and manufacture of the EXSEV Bearing Series using the latest research / development and manufacturing facilities.

JTEKT intends to supply products that live up to customers' expectations, while contributing to environmental conservation and energy saving through streamlined manufacturing.

RESEARCH AND DEVELOPMENT

1 EXSEV Bearings: Composition and Selection

Conventional bearings, made from bearing steel, and lubricants such as oil and grease, may not be applicable in an extreme special environment such as a clean room, vacuum, high temperature application or corrosive environment, or when special characteristics are required, such as being non-magnetic, or insulating, or having superior high speed performance.
Koyo EXSEV Bearings are a special bearing series, developed specifically to address such needs.
Please consult JTEKT when using bearings in a new, unprecedented environment, or when bearings with special characteristics are required.

1 Ceramic Bearings and Special Steel Bearings

2 Lubricants for EXSEV Bearings

3 How to Select EXSEV Bearings

4 EXSEV Bearings with Special Characteristics

1 Ceramic Bearings and Special Steel Bearings

The EXSEV Bearing Series has been developed for use in special applications where conventional bearings are not practical.

The EXSEV Bearings incorporate components made from special material and use special lubricants, to be applicable in extreme special environments such as a clean room, vacuum, high temperature application, or corrosive condition, and to realize special characteristics, such as being non-magnetic, or insulating, or having superior high speed performance.

The EXSEV Bearing series consist of Ceramic Bearings and Special Steel Bearings, depending on the specific materials of the components.

1-1 Ceramic Bearings

Ceramic Bearings, including components made from ceramic, have the special properties that steel bearings do not have, such as being non-magnetic or insulating. They can be used in new applications where conventional bearings have not been practical.

Ceramic Bearings are highly heat resistant, enabling a rolling bearing to be practical in a high temperature environment. The low density of ceramic decreases the centrifugal force induced by rolling elements (balls or rollers), contributing to an increased speed of the apparatus.

Properties of ceramic materials

1) Material characteristics

Table 1-1 below lists the mechanical and physical properties of major ceramic materials used as bearing materials. Table 1-2 compares silicon nitride and high carbon chromium bearing steel.

Table 1-1 Mechanical and physical properties of ceramic materials used as bearing materials

Ceramic Material		Silicon Nitride Si_3N_4	Zirconia ZrO_2	Silicon Carbide SiC
Property	**Unit**			
Density	g/cm^3	3.2	6.0	3.1
Linear expansion coefficient	K^{-1}	3.2×10^{-6}	10.5×10^{-6}	3.9×10^{-6}
Vickers hardness	HV	1 500	1 200	2 200
Module of longitudinal elasticity	GPa	320	220	380
Poisson's ratio		0.29	0.31	0.16
Three point bending strength	MPa	1 100	1 400	500
Fracture toughness	MPa · m$^{1/2}$	6	5	4
Heat resistance (in atmospheric air)	˚C	800	200	1 000 or higher
Thermal shock resistance	˚C	750 or higher	350	350
Coefficient of thermal conductivity	W/(m · K)	20	3	70
Specific heat	J/(kg · K)	680	460	670

Table 1-2 Comparison of characteristics of silicon nitride and high carbon chromium bearing steel

Property	Unit	Silicon Nitride Si_3N_4	High Carbon Chromium Bearing Steel SUJ2	Advantages of Ceramic Bearings
Density	g/cm^3	3.2	7.8	Decrease in centrifugal force induced by rolling elements (balls or rollers) ➔ Longer service life and reduced bearing temperature rises
Linear expansion coefficient	K^{-1}	3.2×10^{-6}	12.5×10^{-6}	Decreased internal clearance change due to reduced bearing temperature rises ➔ Lowered vibration and reduced preload changes
Vickers hardness	HV	1 500	750	Less deformation in rolling contact areas ➔ Higher rigidity
Module of longitudinal elasticity	GPa	320	208	
Poisson's ratio		0.29	0.3	
Heat resistance	˚C	800	180	Retention of superior load carrying characteristics under high temperature
Corrosion resistance		High	Low	Useful in acid or alkaline solutions
Magnetism		Non-magnetic	Ferromagnetic	Decreased rotational fluctuation in ferromagnetic field due to non-magnetization
Conductivity		Insulator	Conductor	Prevents electrical pitting
Bond		Covalent bond	Metallic bond	Decrease in adhesion (or material transfer) due to oil film thinning in rolling contact areas

2) Rolling fatigue of ceramic materials

The individual ceramic materials were tested for rolling fatigue under oil lubrication and under water lubrication, to evaluate their applicability as bearing material. Figs. 1-1 and 1-2 show the results of the tests.

The figures indicate that each ceramic material has a certain level of rolling fatigue strength and that silicon nitride has the highest fatigue strength among the ceramic materials tested.

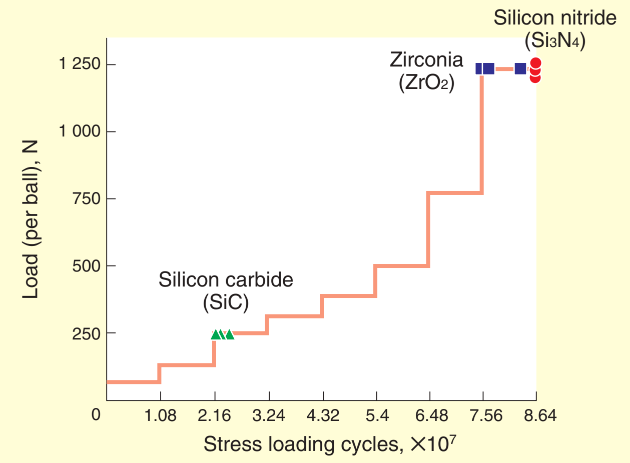

Fig. 1-1 Comparison in rolling fatigue life under oil lubrication

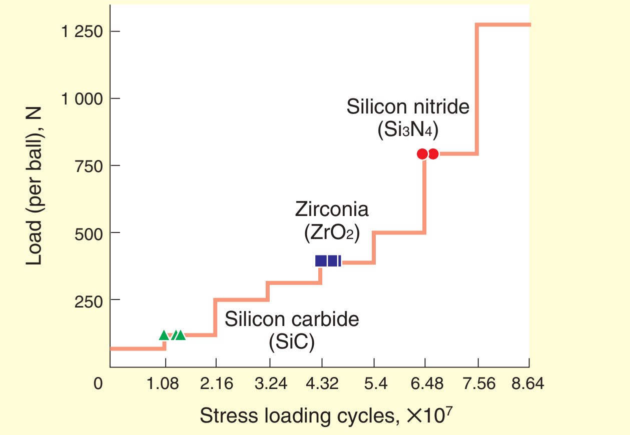

Fig. 1-2 Comparison in rolling fatigue life under water lubrication

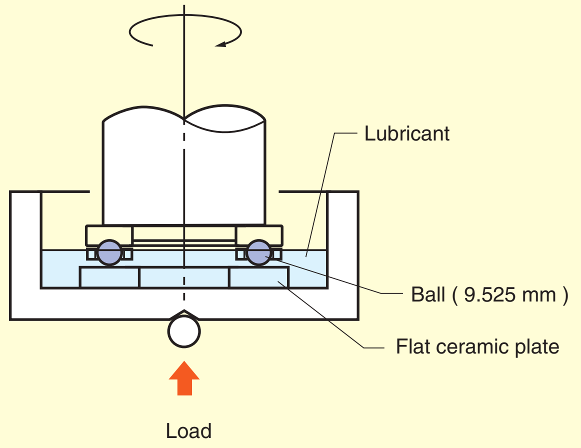
Test conditions

	Oil lubrication	Water lubrication
Lubricant	Spindle oil	City water
Ball	Bearing steel	Ceramic
Load	Increased in stages at every 1.08 × 10^7 cycles	
Rotational speed	1 200 min^{-1}	

Evaluation equipment



Evaluation equipment appearance

Fig. 1-3 Rolling fatigue life test conditions and evaluation equipment

3) Ceramic materials suitable for rolling bearings

Table 1-3 shows the results of evaluating the ceramic materials in terms of their characteristics and the rolling fatigue strength. Among the ceramic materials tested, silicon nitride is the most suitable as rolling bearing material.

JTEKT uses the silicon nitride produced by the hot isostatic pressing (HIP) method as the standard ceramic material for bearings.

4) Composition of ceramic bearings

Koyo ceramic bearings are divided into Full Ceramic Bearings (with all components, namely, the outer ring, inner ring and rolling elements, made of ceramic) and Hybrid Ceramic Bearings (with only the rolling elements made of ceramic). The outer ring and inner ring of the Hybrid Ceramic Bearings are made from special steel, including high carbon chromium bearing steel. The cage may be made of a metallic material, resin, or composite material, depending on the intended operating conditions of the bearing.

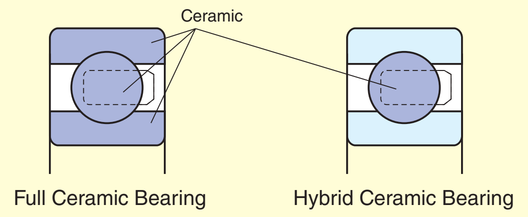


Fig. 1-4 Composition of ceramic bearings

● **Table 1-3 Ratings of ceramic materials as rolling bearing materials**

	Application to rolling bearings		
	Rating	Performance and use	Characteristics
Silicon nitride Si_3N_4	◎	· Comparable to bearing steel in load carrying capability and service life · Suitable for high performance applications	· High speed · High vacuum · Corrosion resistant · Heat resistant · Non-magnetic · High rigidity
Zirconia ZrO_2	○	· Useful under a limited load · Applicable in highly corrosive chemicals	· Highly corrosion resistant
Silicon carbide SiC	○	· Useful under a limited load · Applicable in highly corrosive chemicals	· Highly corrosion resistant · Highly heat resistant

Load ratings and service life of ceramic bearings

Silicon nitride, a ceramic material, is more rigid than high carbon chromium bearing steel; therefore, a bearing including silicon nitride components is subject to a higher contact stress on the area of contact between bearing raceways and rolling elements. Accordingly, to estimate the service life of ceramic bearings, whether the rolling bearing theory is applicable or not is critical.

Basic dynamic load rating

The ISO standard defines the basic dynamic load rating as the pure radial load (for radial bearings), constant in magnitude and direction, under which the basic rating life of 1 million revolutions can be obtained, when the inner ring rotates while the outer ring is stationary or vice versa. The basic dynamic load rating represents the resistance of a bearing against rolling fatigue.

Basic static load rating

The basic static load rating is defined as the static load which corresponds to the calculated contact stress shown below, at the center of the most heavily loaded raceway/rolling elements.

Self-aligning ball bearings : 4 600 MPa
Other ball bearings : 4 200 MPa
Roller bearings : 4 000 MPa

JTEKT defines the dynamic load rating and static load rating of ceramic bearings based on the results of their service life tests, the maximum allowable static load of the ceramic materials, the elastic deformation test results of high carbon chromium bearing steel, and other related data, as shown in Table 1-4.

● **Table 1-4 Load ratings of ceramic bearings**

	Full Ceramic Bearing	Hybrid Ceramic Bearing
Dynamic load rating C_r	Comparable to steel bearings	Comparable to steel bearings
Static load rating C_{0r}	Comparable to steel bearings	85% that of steel bearings

The steel bearings here refer to bearings consisting of rings and rolling elements both made of high carbon chromium bearing steel.

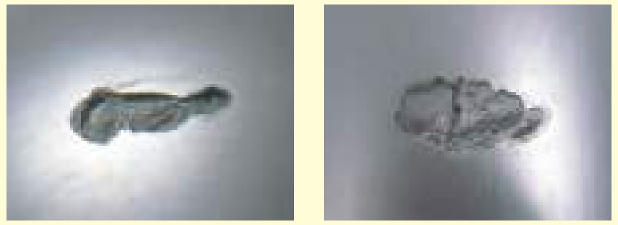
1) Rolling fatigue life of ceramic bearings

A typical service life test for Ceramic Bearings and steel bearings was performed under the conditions specified in Fig. 1-6.

The test results showed that the service life of Ceramic Bearings was equal to or longer than that of steel bearings, exceeding the calculated life.

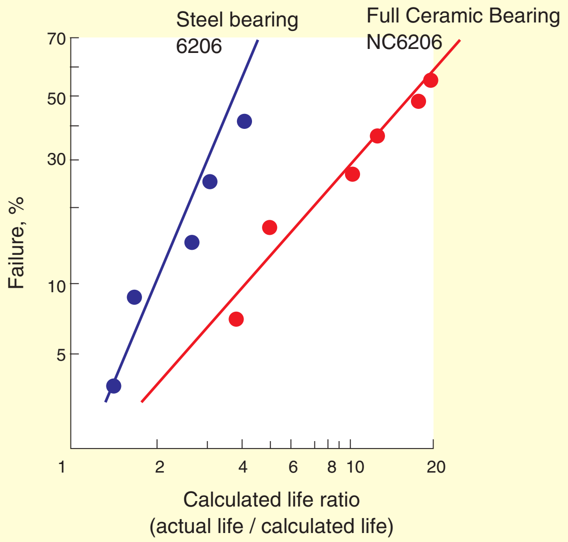
The Ceramic Bearings were found to exhibit flaking (Fig. 1-5) when their service life terminated. The same phenomenon was observed on the steel bearings whose service life terminated.

Based on these findings, as the dynamic load rating of a Ceramic Bearing, that of a steel bearing of the same dimensions can be used.



Ceramic ball
Ceramic inner ring

Fig. 1-5 Flaking on ceramic ball and inner ring



● **Rolling fatigue test conditions**

Bearing number	Material (outer/inner rings and balls)	Dimensions, mm
NC6206	Silicon nitride(Si_3N_4)	30×62×16 (bore × outside dia. × width)
6206	Bearing steel(SUJ2)	

Specification	Condition
Load	5 800 N
Rotational speed	8 000 min^{-1}
Lubrication oil	AeroShell Turbine Oil 500
Temperature	70 ± 2˚C

Fig. 1-6 Rolling fatigue life of Full ceramic bearings and steel bearings

2) Static load rating of ceramic bearings

The basic static load rating of a steel bearing represents a load that produces a localized permanent deformation in the rolling element/raceway contact area, impeding smooth rotation.

However, ceramic materials, which are highly rigid, produce little permanent deformation. Therefore, the theory of the basic static load rating for steel bearings is not applicable to ceramic bearings.

• Static load rating of Full Ceramic Bearings

When exposed to continuous excessive loads, ceramic materials may break down; however, before breakdown occurs, the materials develop cracking.

Fig. 1-7 compares the load measurements at which ceramic balls developed cracking with the basic static load ratings of steel bearings. Fig. 1-8 shows the measurement system.

As these results show, the loads at which cracks develop on the Full Ceramic Bearing are far higher than that of the basic static load rating of steel bearings. This means that the basic load ratings specified in the ISO standard can be used as the allowable static loads of the Full Ceramic Bearing.

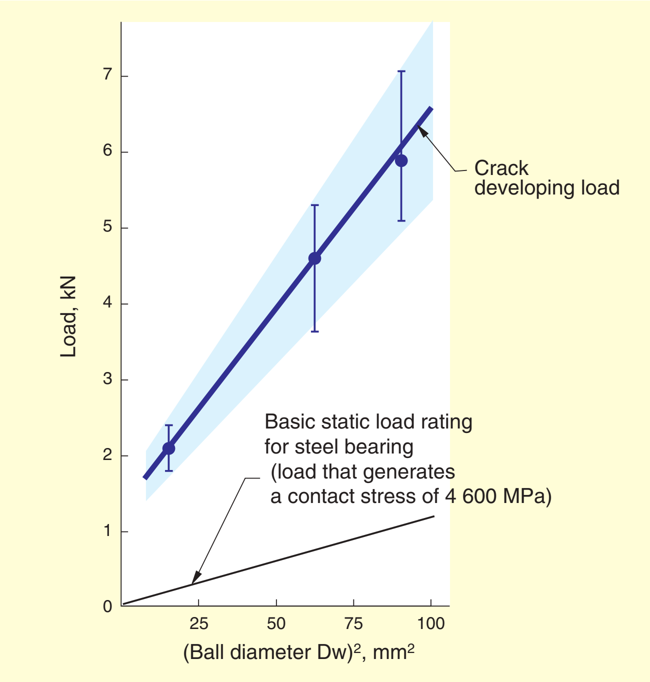


Fig. 1-7 Crack developing loads for Full Ceramic Bearings

• Static load rating of Hybrid Ceramic Bearings

The theory of the static load rating for steel bearings is applicable to Hybrid Ceramic Bearings because their outer and inner rings are made of steel and accordingly any deformation is permanent.

Table 1-5 shows the results of a test for which a high carbon chromium bearing steel ball and ceramic ball were pressed against a flat plate of high carbon chromium bearing steel and the resulting permanent deformations (indentation depths) on the flat plate and balls were measured.

● Table 1-5 Measurements of permanent deformation produced on flat steel plate and balls

	Load kN	Permanent deformation (average), mm		Permanent deformation (sum of averages), mm
		Flat plate (bearing steel)	Ball	
Ceramic ball	0.65	0.5	—	0.5
	1.3	1.9	—	1.9
	2.6	5.2	—	5.2
	3.9	9.3	—	9.3
Steel ball	0.65	0.4	—	0.4
	1.3	1.3	0.11	1.41
	2.6	4.0	0.41	4.41
	3.9	6.8	1.18	7.98

These results indicate that ceramic balls do not suffer permanent deformation and that the permanent deformation produced on the flat steel plate by the ceramic balls is approximately 1.2 times the sum of the deformation produced on the flat plate by steel ball and the deformation that the steel ball undergo.

Accordingly, the static load rating of Hybrid Ceramic Bearings can be determined based on the permanent deformation of their bearing steel rings. JTEKT uses the load equal to 85% of the static load rating of steel bearings as the static load rating of the Hybrid Ceramic Bearings.

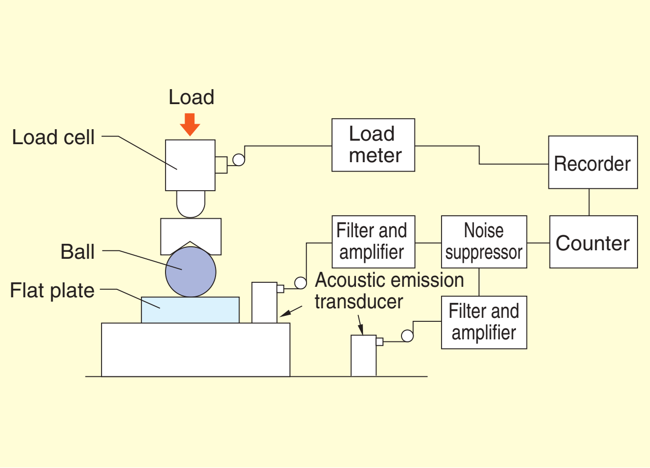

Fig. 1-8 Crack generating load measurement system

3) Impact strength of ceramic bearings

To evaluate the impact strength of ceramic bearings, ceramic balls were crushed by two methods: by a static load and an impact load. The test results are shown in Fig. 1-9. Fig. 1-10 shows the testing methods.

This figure shows that the impact strength of the ceramic bearings is almost equal to the static load strength, which means the bearings possess sufficient impact strength.

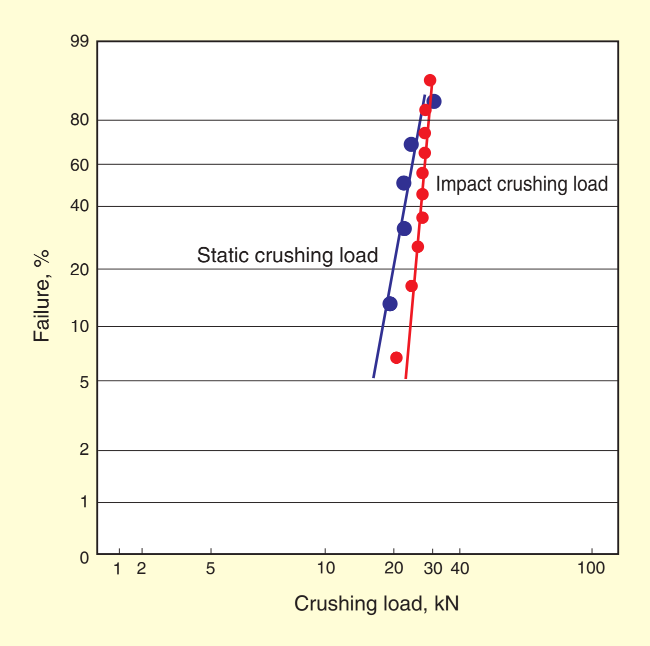

Fig. 1-9 Comparison of static load and impact load that crush ceramic balls

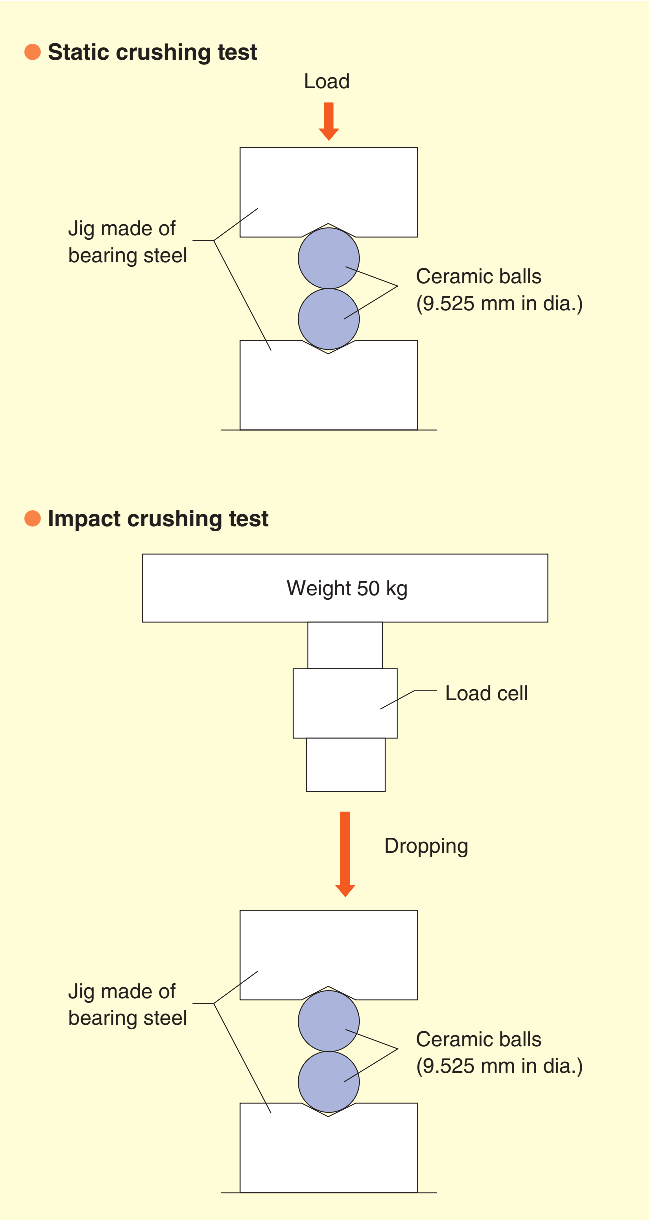

Fig. 1-10 Ceramic ball crushing test method

4) Fitting of ceramic bearings

When using ceramic bearings, it should be noted that ceramic materials are largely different from steel materials in the coefficient of linear expansion. Attention should therefore be paid to fitting stresses and temperature rises.

The following are the results of evaluating the fitting of a Ceramic Bearing on a stainless steel shaft.

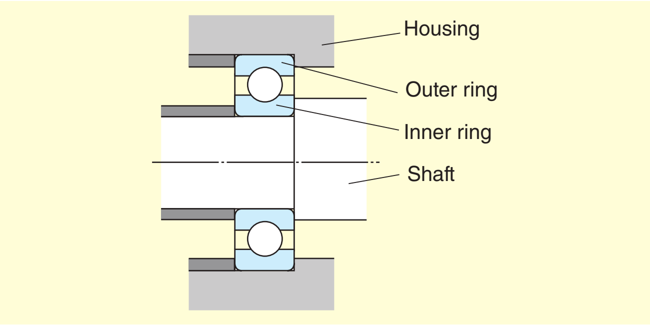

Fig. 1-11 Bearing fitting

• Maximum stress produced by fitting

Table 1-6 shows the results of a static strength test conducted on a ceramic ring fitted on a stainless steel shaft. Table 1-7 shows the results of a dynamic strength test (running test) conducted on a ceramic ring fitted on a stainless steel shaft.

Based on the results of these tests, JTEKT makes it a rule for the maximum stress produced by interference to be no greater than 150 MPa when a ceramic inner ring is fitted on a stainless steel shaft.

Consult JTEKT for applications requiring tighter fitting.

● Table 1-6 Typical results of static strength test on ceramic bearing shaft fitting

	Interference, L_{10} μm	Ring's fracture stress MPa
Solid shaft	50	399
Hollow shaft	68	332

● Table 1-7 Typical results of dynamic strength test on ceramic bearing shaft fitting

	Max. allowable interference μm	Max. allowable stress for ring MPa
Solid shaft	31	243
Hollow shaft	43	204

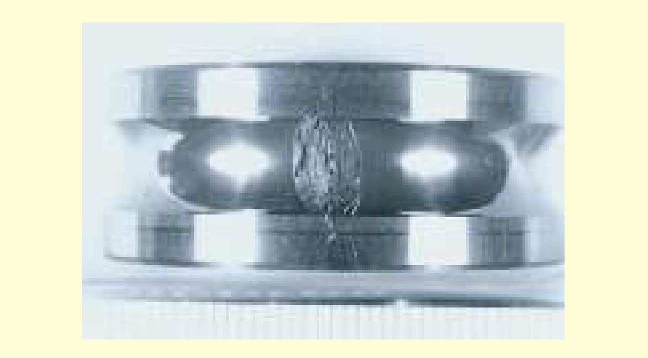

Fig. 1-12 Ceramic inner ring damaged by dynamic strength test

• Influence of temperature

During operation, bearing temperature exceeds the ambient temperature. When a ceramic bearing is operated on a stainless steel shaft or in a stainless steel housing, the interference with the shaft increases due to the difference in linear expansion coefficient while the interference with the housing decreases. (When the outer ring is loose-fitted, the clearance increases.)

To determine the class of fit for a ceramic bearing, the maximum temperature during operation should be assessed carefully.

■ The maximum stress generated on the inner ring due to the interference with the shaft can be determined from the following equation:

$$\sigma = P_m \cdot \frac{D_i^2 + d^2}{D_i^2 - d^2}$$

$$P_m = \varDelta_{deff}\left[\frac{d}{E_B}\left(\frac{D_i^2 + d^2}{D_i^2 - d^2} + \nu_B\right) + \frac{d}{E_S}\left(\frac{d^2 + d_0^2}{d^2 - d_0^2} - \nu_S\right)\right]^{-1}$$

σ :Maximum circumferential stress to interference (MPa)
P_m :Pressure of contact on fitting surface (MPa)
d, D_i :Inner ring bore diameter and outside diameter (mm)
$\varDelta_{deff}$:Effective interference of inner ring (mm)
d_0 :Bore diameter of hollow shaft (mm)
E_B, ν_B :Bearing's modulus of longitudinal elasticity and Poisson's ratio (MPa)
E_S, ν_S :Shaft's modulus of longitudinal elasticity and Poisson's ratio (MPa)

1-2 Special Steel Bearings

Table 1-8 lists the typical special steels used to produce the bearing rings and rolling elements of EXSEV Bearings.

● Table 1-8 Characteristics of the typical special steels used for EXSEV Bearings

◎ : Superior, ○ : Good

	Hardness HRC	Modulus of longitudinal elasticity GPa	Coefficient of linear expansion $\times 10^{-6}$K^{-1}	Load carrying capability	Applications
High carbon chromium bearing steel SUJ2	61	208	12.5	◎	Hybrid Ceramic Bearings for insulation, etc.
Martensitic stainless steel SUS440C	60	208	10.5	◎	Clean environments and vacuum environments
Precipitation hardening stainless steel SUS630	40	196	11.0	○	Corrosive environments
High speed tool steel M50	61	207	10.6	◎	High temperature environments
High speed tool steel SKH4	64	207	12.0	◎	High temperature environments
Non-magnetic stainless steel	43	200	18.0	○	Magnetic field environments

1) Bearings for use in clean and/or vacuum environments

The rings and rolling elements of conventional bearings are made of high carbon chromium bearing steel (JIS SUJ2), which is resistant to rolling fatigue. However, due to a relatively low corrosion resistance, this steel requires application of anticorrosive oil or other suitable rust preventive measure.

Applying anticorrosive oil to bearings is not favorable for use in a clean and / or vacuum environment, due to the possibility of contamination. Accordingly, EXSEV Bearings use martensitic stainless steel (JIS SUS440C), which is highly corrosion resistant, as a standard material for use in a clean environment.

2) Bearings for use in corrosive environments

For a highly corrosive environment where the SUS440C is not enough to prevent corrosion, precipitation hardening stainless steel (JIS SUS630) is used. However, SUS630 has a hardness of 40 HRC, which is inferior to other materials in load carrying capability and rolling fatigue strength.

3) Bearings for use in high temperature environments

Fig. 1-13 shows the high temperature hardness of various materials. SUS440C has a hardness of 55 HRC at 300˚C, which means it can be used in a high temperature environment of up to approximately 300˚C. In an environment heated in excess of 300˚C, high speed tool steel (JIS SKH4, AISI M50, etc.) should be used.

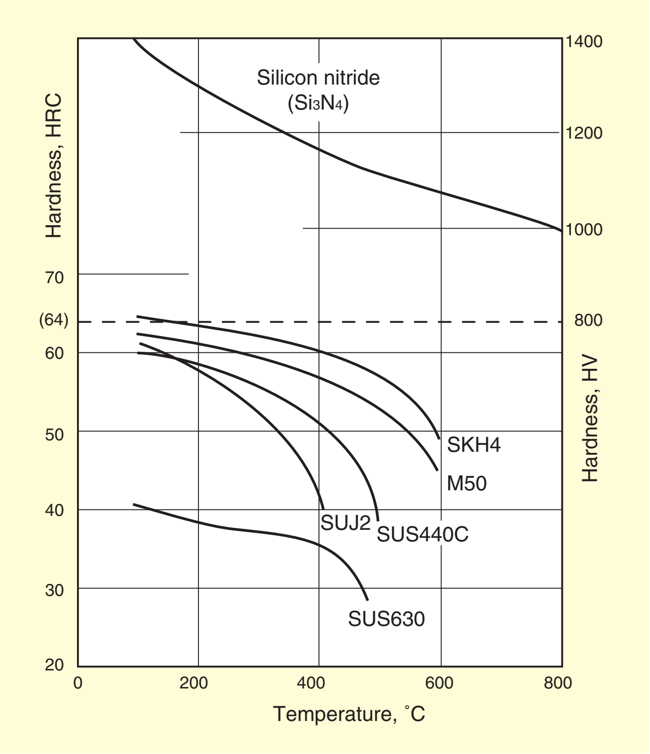

Fig. 1-13 High temperature hardness of various bearing materials

2 Lubricants for EXSEV Bearings

Bearing performance depends on lubrication; it is no exaggeration to say that lubrication determines the service life of bearings. Grease or a solid lubricant is properly used to lubricate the EXSEV bearings.

Compared with solid lubricants, grease is superior for the high speed performance, load carrying capability, and service life of bearings. Therefore, it is recommended to use grease as much as possible.

Grease cannot be used for some application in an ultrahigh vacuum, high temperature, or clean environment. In an application where oil evaporation from grease is unacceptable, solid lubricants should be used.

2-1 Grease

1) High temperature, vacuum or clean environments

Fluorinated greases are known as useful for high temperature applications. Its base oil is perfluoropolyether (PFPE) and its thickener is polytetrafluoroethylene (PTFE).

Fluorinated grease has a low evaporation pressure, and can be used in a vacuum environment of approximately 10^{-5} Pa at room temperature. Another advantage of this grease is low particle emissions, and is applicable in a clean environment. Owing to these excellent characteristics, fluorinated grease is used as the standard grease for the EXSEV Bearings.

2) High vacuum environments

Fluorinated greases are classified according to whether the base oil includes an acetal bond ($-O-CF_2-O-$) and whether side chains are included (Table 2-1).

Note that when a fluorinated grease is used in a vacuum, these differences in molecular structure may cause the molecular chains to be disconnected and decompose, resulting in a difference in the amount of gas emissions in the vacuum.

For the PFPE of the three greases listed in Table 2-1, Fig. 2-1 shows the results of gas emissions evaluation, using four ball type vacuum test equipment.

As can be seen Fig. 2-1, oil A, which originally has the acetal structure, apparently emits a great amount of oxide components, such as CF_2O^+, $C_2F_3O^+$ and $C_2F_5O^+$, which are attributed to the decomposition of the acetal structure. It emits a greater amount of gas than other oils.

As the standard grease for the EXSEV Bearings, JTEKT uses fluorinated grease containing oil B or PFPE, whose molecular chains are not easily torn off.

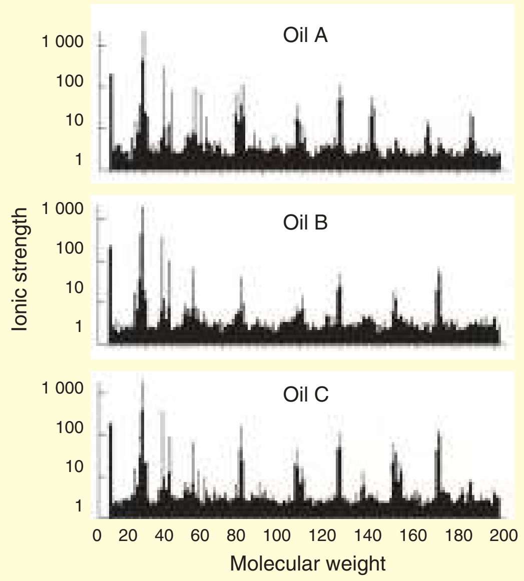

Fig. 2-1 Differences in gas emissions from PFPE

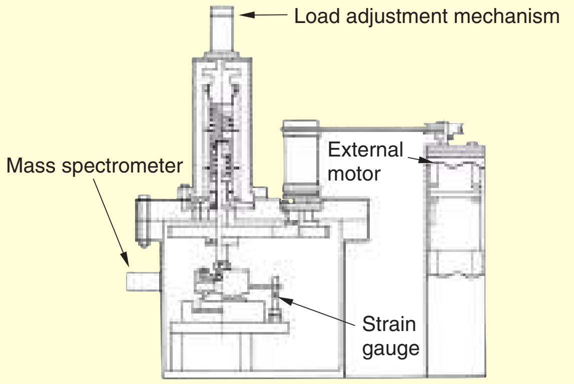

Exhaust system : Turbo molecular pump & rotary pump
(exhaust possible up to 10^{-7} Pa)

Fig. 2-2 Four ball type vacuum test equipment

Table 2-1 Tested PFPEs and their characteristics

Oil	Molecular structure	Viscosity, 20°C mm²/s	Mean molecular weight	Vapor pressure, 20°C Pa
A	$CF_3-(OCF_2CF_2)_p-(OCF_2)_q-OCF_3$	255	9 500	4×10^{-10}
B	$F-(CF_2CF_2CF_2O)_n-CF_2CF_3$	500	8 400	7×10^{-9}
C	 $F-\left(\begin{array}{c}CFCF_2O\\ \vert\\ CF_3\end{array}\right)_m-CF_2CF_3$	2 700	11 000	4×10^{-12}

2-2 Solid Lubricants

In an environment where oil and grease cannot be used, a solid lubricant is used to lubricate bearings.

Solid lubricants can roughly be classified into soft metals, layer lattice materials, and polymeric materials.

Table 2-2 shows the characteristics of major solid lubricants used for the EXSEV Bearings, along with the major applications where the individual solid lubricants are used.

1) Soft metals

Soft metals, such as silver (Ag) and lead (Pb), are coated on balls by the ion plating method (refer to Fig. 2-3). These lubricants are effective for use in ultrahigh vacuum environments where gas emissions from bearings should be avoided.

Silver coated components require careful handling because silver is susceptible to oxidization and durability deteriorates rapidly once oxidized. Lead is seldom used as a lubricant because it is hostile to the environment.

2) Layer lattice materials

Among layer lattice materials, molybdenum disulfide (MoS_2) is coated to the cage and bearing rings, or is used as an additive for composite materials, while tungsten disulfide (WS_2) is not used as a coating material but used only as an additive for composite materials (refer to Fig. 2-4).

These lubricants are superior to polymeric materials in heat resistance and load carrying capability, and are used for high temperature applications or applications where a large load carrying capability is required.

Layer lattice materials should not be used in a clean environment because they emit an excessive amount of particles.

3) Polymeric materials

Polymeric materials are coated to the cage and/or bearing rings. They are also used to make cages (refer to Fig. 2-5).

Polymeric materials are suitable for applications where cleanliness is critical or the environment is corrosive. Because they are relatively independent of ambient conditions, they are suitable for applications where bearings are repeatedly exposed to atmospheric air and a vacuum.

Fig. 2-3 Balls coated with silver ion plating

Polymeric materials	Polytetrafluoroethylene (PTFE)	260	260	0.04 to 0.2	0.04 to 0.2	1 000 max.	◎	△	Clean, vacuum, and/or corrosive environments
	Polyimide (PI)	300	300	0.05 to 0.6	0.05 to 0.6	1 000 max.	○	△	

4) Service life of solid lubricants

Bearings lubricated with a solid lubricant can provide stable running performance as long as the lubricant is supplied continuously. When the lubricant is used up, the metal components become in contact with each other, rapidly increasing running torque and reducing the service life of the bearing. The service life of bearings is greatly influenced by the operating conditions. As a consequence, it is not always possible to accurately estimate the service life of bearings lubricated with solid lubricant because of the variations in operating conditions.

When a solid lubricant is used to lubricate a bearing, the bearing is generally used under a relatively light load, such as 5% or less of the basic dynamic load rating. Based on the results of various experiments under the above mentioned operating conditions, JTEKT provides the following experimental equation to enable an estimation of the service life of a deep groove ball bearing lubricated with a solid lubricant. For details, refer to the following product pages.

• Polymeric materials

The average service life of clean pro coated bearings can be estimated by the following equation:

$$L_{av} = b_2 \cdot \left(\frac{C_r \times 0.85}{P_r}\right)^q \times 0.016667/n$$

Where,

L_{av} : Average life, h
b_2 : Lubrication factor
$b_2 = 420$ (New Clean Pro Bearing-PR, Clean Pro Bearing-RZ)
C_r : Basic dynamic load rating, N
P_r : Dynamic equivalent radial load, N
q : Exponential coefficient, $q = 3$
n : Rotational speed, min^{-1}

Clean Pro Bearing-RZ .... Page 31
New Clean Pro Bearing-PR .... Page 35

• Layer lattice materials

The average service life of the EXSEV Bearings whose cage is coated with molybdenum disulfide (EXSEV®-MO) can also be estimated by the above equation, supposing that b_2 equals to 6.

EXSEV®-MO .... Page 63

• Soft metal materials

The average service life of the EXSEV Bearing whose balls are silver ion plated (EXSEV®-MG) can be estimated using the following equation:

$$L_{vh} = b_1 \cdot b_2 \cdot b_3 \left(\frac{C_r}{13 \times P_r}\right)^q \times 16\,667/n$$

Where,

L_{vh} : 90% reliability service life, h
C_r : Basic dynamic load rating, N
P_r : Dynamic equivalent radial load, N
q : Exponential coefficient, $q = 1$
n : Rotational speed, min^{-1} ($10 \leq n \leq 10\,000$)
b_1 : Speed factor
$b_1 = 1.5 \times 10^{-3}\, n + 1$
b_2 : Lubrication factor
$b_2 = 1$
b_3 : Ambient pressure/temperature factor
$b_3 = 1$(at 10^{-3} Pa and room temperature)

EXSEV®-MG .... Page 59

The basic dynamic load ratings and the permissible radial loads listed in this catalog are as follows.

Basic dynamic load rating: Strength against bearing rolling fatigue
Permissible radial load: They can be regarded as the maximum loads applicable to individual bearings. When an axial load is applied to the bearing, convert this axial load to a dynamic equivalent radial load, and then compare this value to the permissible radial load.

✻ Bearings lubricated with a solid lubricant are generally damaged by friction and not by rolling fatigue. For this reason, the permissible radial load is listed on each page for bearings lubricated with a solid lubricant.

3 How to Select EXSEV Bearings

3-1 Clean Environments

In a clean environment, bearings made of high carbon chromium bearing steel applied with rust preventive oil cannot be used. Accordingly, stainless steel bearings are used without applying rust preventive oil. A low particle emission type lubricant should be used for these bearings.

Fig. 3-1 shows an EXSEV Bearing selection chart on the basis of the cleanliness class and temperature of the environment. In this chart, each numerical value has a margin.

The amounts of particle emissions from bearings differ depending on operating conditions such as temperature, load and rotational speed. Please consult JTEKT for applications who's operating conditions are near the bearing applicability divisions specified in Fig. 3-1.

Table 3-1 compares the particle emissions of various lubricants provided for major EXSEV Bearings.

For an unlubricated EXSEV Bearing, more than 3 million particles are found for every 20 hours. When silver or molybdenum disulfide is used as a lubricant, 10 000 or more particles are emitted, indicating that neither is suitable for clean environments.

Bearings using a fluorine polymer are low in particle emissions and suitable for use in clean environments.

Bearings lubricated with a New Clean Pro Bearing-PR coating or fluorinated grease are also useful in clean environments because they are low in particle emissions.

Fluorinated grease is superior to solid lubricants in load carrying capability and high speed operation. This grease can be used in applications where a slight amount of scattering of fluorinated oil is acceptable.

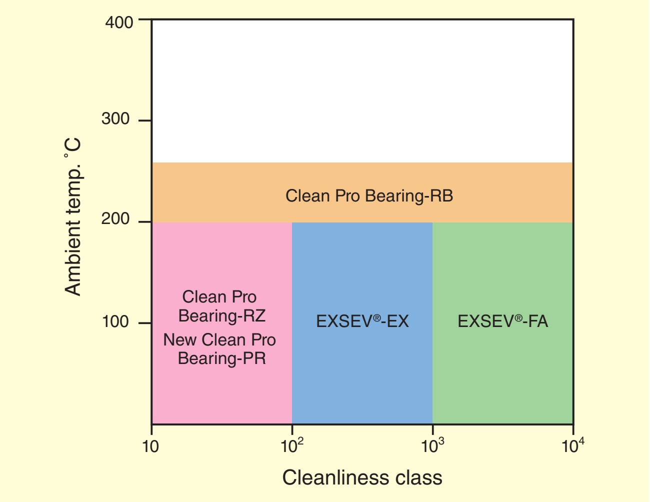

Fig. 3-1 EXSEV Bearings suitable for clean environments

● Table 3-1 Particle emissions from major EXSEV Bearings

Bearing material composition			Lubrication		Number of emitted particles during 20-hour test duration
Bearing rings	Balls	Cage	Lubricated component	Lubricant

3-2 Vacuum Environments

• Bearing materials

Outer/inner rings and balls of the bearings for use in a vacuum environment are usually made of martensitic stainless steel (SUS440C). For the bearings requiring corrosion resistance, precipitation hardening stainless steel (SUS630) is used. When high temperature resistance is required, high speed tool steel (SKH4, M50, etc.) can be used. For a special operating condition, ceramic having excellent heat/corrosion resistance may be used.

• Lubricants

A bearing used in an ordinary vacuum chamber is repeatedly exposed to atmospheric air and vacuum. There is no rolling bearing lubricant that is effective for use under such a wide pressure range. The lubricant should optimally be selected in consideration of principal ambient pressure and temperature as well as required cleanliness and corrosion resistance when necessary.

1) When cleanliness is not critical:

Fig. 3-2 shows the EXSEV Bearings that are suitable for vacuum applications that do not require cleanliness.

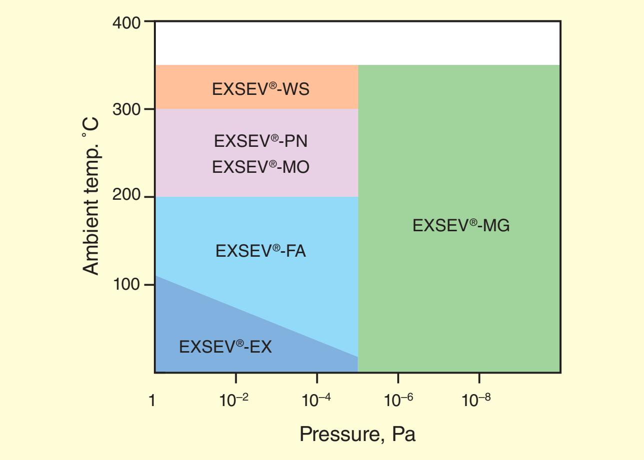

Fig. 3-2 EXSEV Bearings useful for vacuum applications where cleanliness is not critical

When the ambient temperature is near normal room temperature and vacuum is 10^{-5} Pa or less, fluorinated grease is used for lubrication. However, since the fluorinated oil contained in the grease gradually begins to evaporates, a solid lubricant should be used in applications where oil scattering should not occur.

In an ultrahigh vacuum environment with pressure lower than 10^{-5} Pa, gas emissions from bearings may pose a problem. For this pressure range, EXSEV®-MG lubricated with silver, a soft metal lubricant, should be used.

2) When cleanliness is critical:

When bearings should be clean, solid lubricants such as soft metal materials and layer lattice materials cannot be used because of excessive particle emissions. In such a case, a polymeric material or fluorinated grease is used.

Figs. 3-3 and 3-4 show the EXSEV Bearings applicable for vacuum environments with cleanliness classes 100 and 10, respectively.

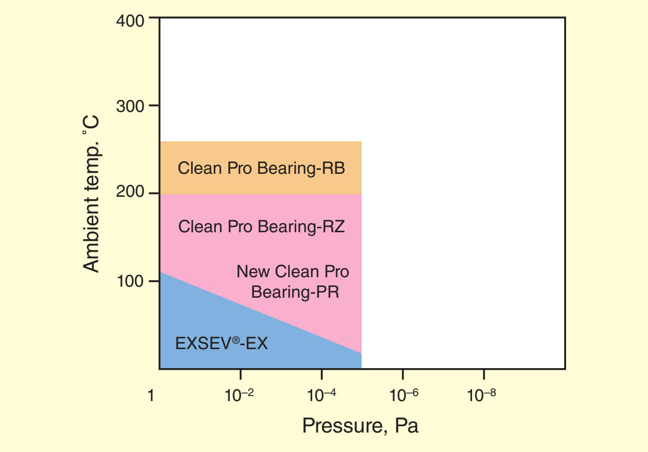

Fig. 3-3 EXSEV Bearings applicable for cleanliness class 100

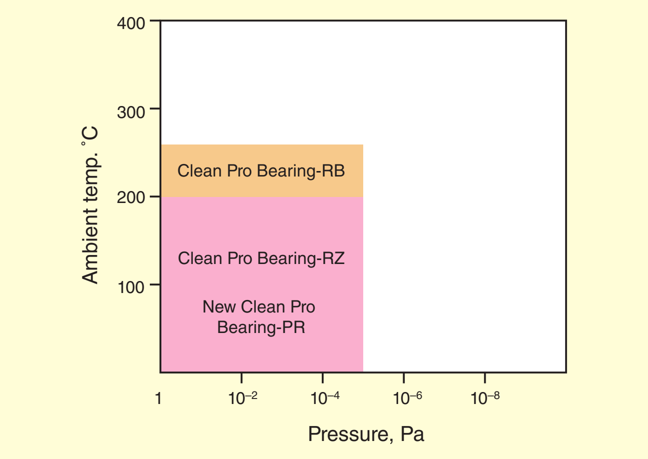

Fig. 3-4 EXSEV Bearings applicable for cleanliness class 10

3-3 High Temperature Environments

• Bearing materials

Fig. 3-5 shows bearing materials for high temperature applications.

SUS440C can withstand temperatures up to approximately 300˚C.

In the range from 300˚C to approximately 500˚C, High Temperature Hybrid Ceramic Bearings, whose bearing rings are made of highly heat resistant high speed tool steel (SKH4 or M50) and rolling elements made of ceramic, should be used.

In a high temperature environment in excess of 500˚C, full ceramic bearings should be used.

• Lubricants

Fig. 3-5 shows lubricants for high temperature applications. In a temperature range of up to approximately 200˚C, fluorinated grease can be used. At temperatures over 200˚C, a layer lattice material should be used.

Because all layer lattice materials emit a large amount of particles, they are not suitable for applications where cleanliness is required. Graphite cannot be used in a vacuum environment because it does not serve as a lubricant in a vacuum.

In a high temperature environment over 500˚C, there is no lubricant that can work perfectly. Unlubricated full ceramic bearings are used for such a high temperature application.

Fig. 3-6 shows the EXSEV Bearings useful for high temperature applications.

The temperatures shown in the figure are approximate. When the operating temperature of your application is near a temperature division specified in this figure, consult JTEKT.

If a bearing is exposed to a high temperature in a clean or vacuum environment, please refer to the sections entitled "Clean Environments" or "Vacuum Environments".

3-4 Corrosive Environments

1) Corrosion resistance of special steels

Table 3-2 shows the corrosion resistance of the special steels used for the EXSEV Bearings to major corrosive solutions.

In stainless steels, SUS630 is superior to SUS440C in corrosion resistance. However, in such a highly corrosive solution as an acid or alkaline solution, or if the solution must be kept free from rust, these special steels cannot be used.

2) Corrosion resistance of ceramic materials

Table 3-3 shows the corrosion resistance of ceramic materials. Silicon nitride, which is used as the standard material of the ceramic bearings, is excellent in corrosion resistance. However, it may develop corrosion in a highly corrosive chemical, a high temperature, or other highly corrosive ambient condition.

There are two types of ceramic corrosion: One is the corrosion of the alumina-yttria system sintering aid ($Al_2O_3 - Y_2O_3$), which is used to bake ceramic materials. To avoid this type of corrosion, corrosion resistant silicon nitride treated with a spinel sintering aid ($MgAl_2O_4$) should be used. Fig. 3-7 shows the mass reduction and bending strength deterioration of corrosion resistant silicon nitride dipped in an acid or alkaline solution for a given period of time.

The other type of corrosion is the corrosion of the silicon nitride itself. For use in a highly corrosive solution, bearings made of zirconia (ZrO_2) or silicon carbide (SiC) may be effective.

To select a ceramic bearing for use in a highly corrosive environment, its corrosion resistance to the specific condition should be carefully examined.

Table 3-2 Corrosion resistance of special steels and materials for cages

Solution	Concentration	Steels				Concentration	Materials for cages

Note) The corrosive natures of individual solutions differ largely depending on the concentration and temperature. Note that mixing two or more chemicals may increase the corrosivity.

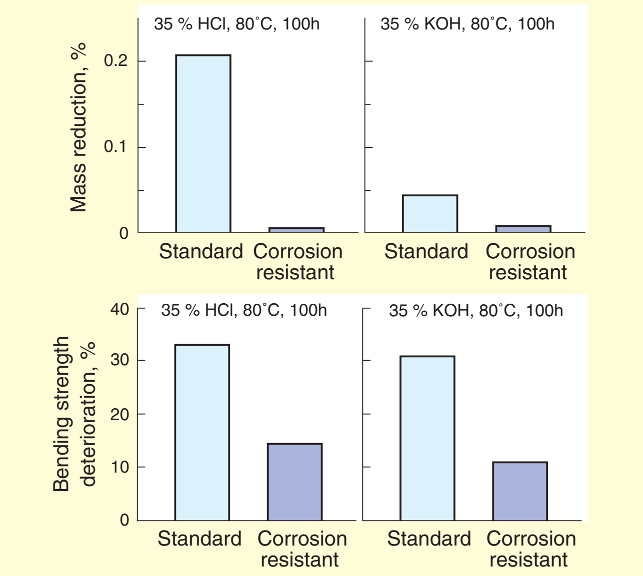

Fig. 3-7 Anticorrosive performance of corrosion resistant silicon nitride

3) Service life of corrosion resistant bearings

Table 3-4 lists the bearings suitable for applications requiring corrosion resistance, along with their major applications.

Table 3-4 Typical corrosion resistant EXSEV Bearings

	Applications	Bearing Materials		Page
		Bearing Rings	Balls	
Corrosion Guard Pro Bearing-SC	In a strongly acidic environment, strongly alkaline environment and corrosive gas	Silicon carbide	Silicon carbide	41
Corrosion Guard Pro Bearing-SN	In a strongly acidic environment, strongly alkaline environment and reactive gas	Corrosion resistant silicon nitride	Corrosion resistant silicon nitride	43
Ceramic Bearings	In a slightly acidic environment, alkaline environment and reactive gas	Silicon nitride	Silicon nitride	45
Corrosion Guard Pro Bearing-ZO	In saltwater, a slightly acidic environment and alkaline environment	Zirconia	Zirconia	47
Corrosion Guard Pro Bearing-MD	In water, alkaline environment and reactive gas	SUS630	Silicon nitride	49

When EXSEV Bearings are operated in a solution, the solution serves as a lubricant. This means the solution is closely associated with the service life of the bearings. Fig. 3-8 shows the service life evaluation results for three types of EXSEV Bearings under water.

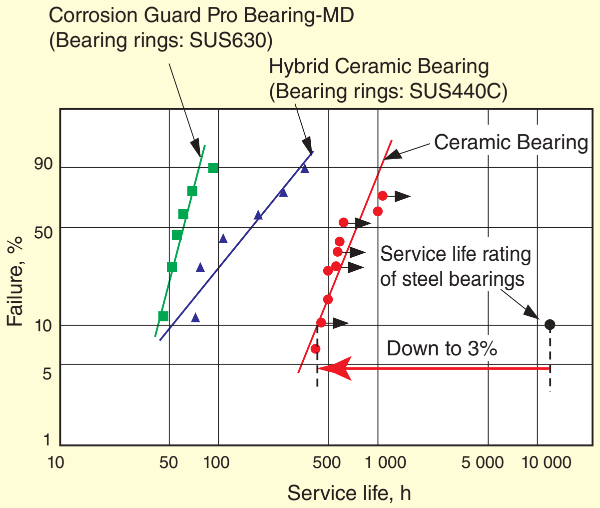
The Ceramic Bearings terminate their service life due to the flaking on the bearing ring or ball surfaces.

In case of the Hybrid Ceramic Bearings, ceramic balls do not develop flaking or wear. Their service life ends due to wear attributed to the minute corrosion of stainless steel bearing rings.

When bearings are used in a solution whose lubrication performance is not enough, such as in water, it is important to evaluate in advance the susceptibility of the bearings to corrosion and the relationship between the bearing load and wear in the solution.

SUS440C has a longer service life than SUS630; however, the former steel is not suitable for use in water because it may rust and cause contamination.

Ceramic Bearings may develop wear at an early stage of use depending on the characteristics of the solution, temperature, and load. Please contact JTEKT before using Ceramic Bearings in solutions.



Test conditions

Bearing No.: 6206 or equivalent
Rotational speed: 1 500 min^{-1}
Radial load:
Ceramic Bearing: 1 470 N
Corrosion Guard Pro Bearing-MD: 196 N
Hybrid Ceramic Bearing: 196 N

Fig. 3-8 Comparison in underwater service life of EXSEV Bearings

4 EXSEV Bearings with Special Characteristics

4-1 Non-magnetic Bearings

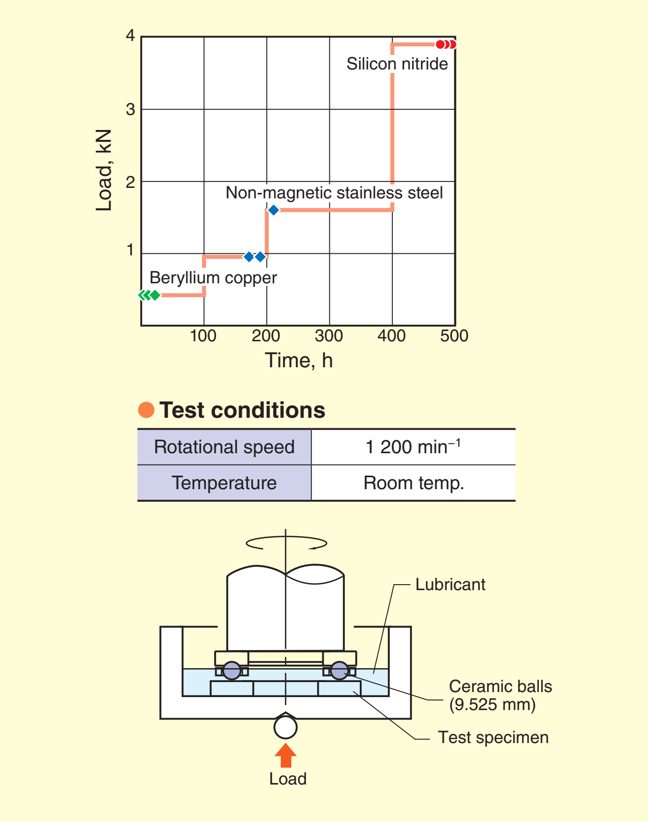
Bearings may be exposed to magnetic fields in some applications, including equipment associated with super conductivity, semiconductor production facilities and medical examination facilities. If steel bearings are used for such applications, the running torque may fluctuate or the magnetic field may be disturbed. Non-magnetic bearings should be used for such applications. As a non-magnetic material for such bearings, beryllium copper has conventionally been used. However the use of beryllium copper should be avoided since it contains beryllium, a substance of environmental concern.

For such applications, JTEKT supplies Hybrid Ceramic Bearings, whose rings are made of non-magnetic stainless steel and rolling elements are made of a ceramic material, or the full ceramic bearings.

● **Table 4-1 Non-magnetic bearings and relative permeability**

	Relative permeability	Page
Non-magnetic Hybrid Ceramic Bearings	1.01 or lower	65
Ceramic Bearings	1.001 or lower	45
(Ref.) Beryllium copper	1.001 or lower	—

Fig. 4-1 shows a rolling fatigue strength evaluation result for various non-magnetic materials. As can be seen from the figure, non-magnetic stainless steel is superior to beryllium copper in rolling fatigue strength.



● **Test conditions**

Rotational speed	1 200 min^{-1}
Temperature	Room temp.

Fig. 4-1 Comparison of non-magnetic materials in rolling fatigue strength

4-2 Insulating Bearings

A cause of bearing failure in motors or generators is electric pitting. Electric pitting occurs when a surface in rolling contact is locally molten due to sparks produced over the very thin lubricating oil film on the surface when electricity passes through the bearing in operation.

Electric pitting appears as a series of pits or a series of ridges on the surface in rolling contact, which is shown in Fig. 4-2 and Fig. 4-3.

An estimation of the mechanism that causes electric pitting on a bearing is shown in Fig. 4-4.

Fig. 4-2 Electric pitting generated on general purpose bearings (pits)

Fig. 4-3 Electric pitting generated on general purpose bearings (ridges)

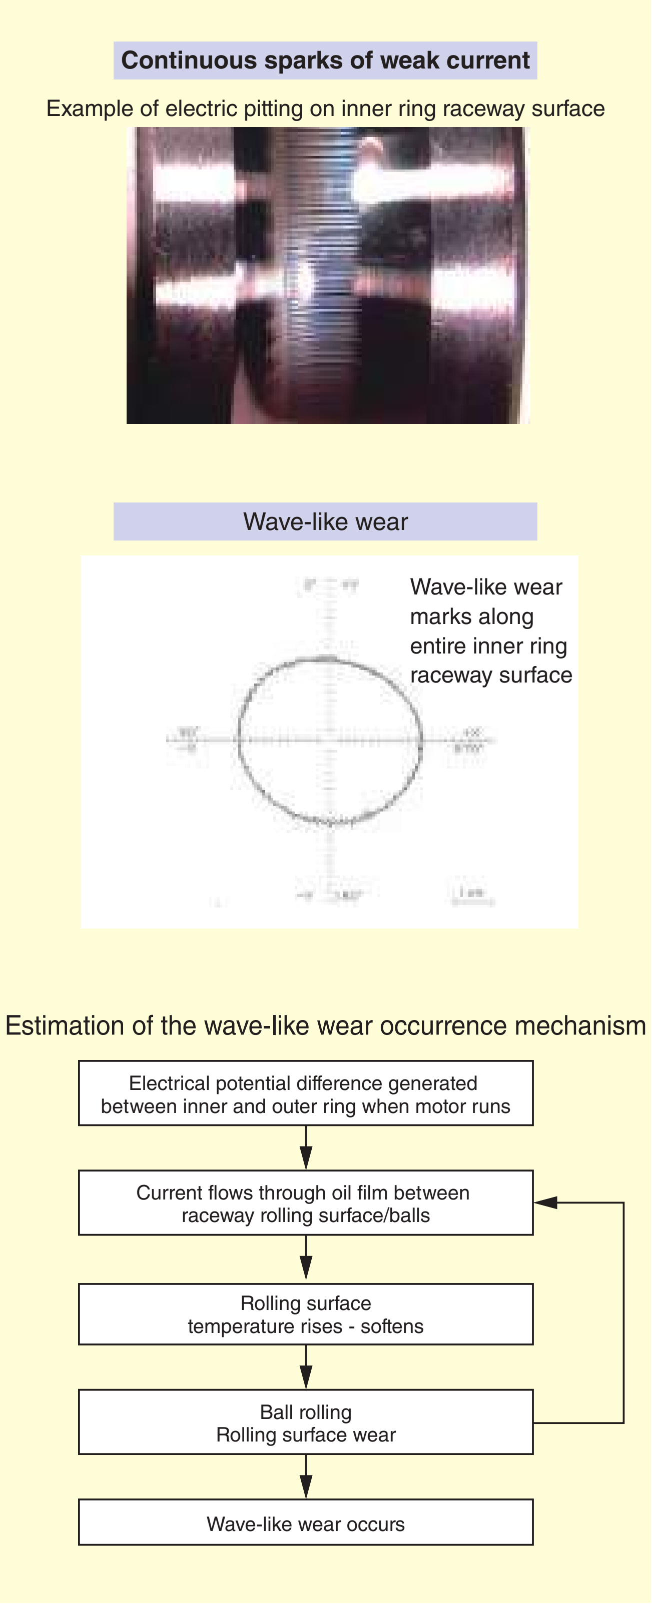


Fig. 4-4 Estimation of electric pitting (wave-like wear) occurrence mechanism

To avoid such pitting, a bypass is provided to ensure that no electric current passes through the bearing. Another method is to use an insulating bearing that can block electric current.

Since ceramic materials exhibit an excellent insulation performance, Hybrid Ceramic Bearings consisting of ceramic rolling elements can be used as insulating bearings. (Fig.4-5)

Hybrid Ceramic Bearings prevent electric pitting, also reduce bearing temperature rise, and lengthen grease service life. For these reasons, Hybrid Ceramic Bearings assure long term maintenance free operation and high speed equipment operation.

Fig. 4-5 Insulating bearings (Hybrid Ceramic Bearings)

Also, ceramic materials have the same insulation performance as silicon nitride. In addition, we can now support Hybrid Ceramic Bearings that use oxide ceramics, which have the characteristic of having a coefficient of linear expansion that is close to that of the metal used in the inner and outer rings material, for their rolling elements. This has enabled us to reduce fluctuations in the clearances between the balls and the inner and outer rings due to temperature fluctuations to a higher level than was possible with conventional bearings. This makes it possible to use these bearings in environments spanning an even larger range of temperatures.

Fig. 4-6 Insulating bearings (oxide ceramic balls)

4-3 High Speed Bearings

Hybrid Ceramic Bearings, whose rolling elements are made of a ceramic material with a density lower than that of bearing steel, are most suitable for high speed applications. This is because reduced mass of rolling elements suppresses the centrifugal force of the rolling elements, as well as slippage attributable to the gyro-moment, when the bearings are in operation.

Thanks to their superior high speed performance, Hybrid Ceramic Bearings are used in turbochargers and on machine tool spindles.

• Power losses at high speed

Fig. 4-7 compares power losses between the Hybrid Ceramic Bearings and steel bearings.

When compared to steel bearings, the Hybrid Ceramic Bearings lose smaller power during high speed operation. The power loss decreases with increasing rotational speed.

The Hybrid Ceramic Bearings also have superior antiseizure characteristics, which means that they consume smaller amount of lubrication oil and thereby reduce rolling resistance (power loss).

		Hybrid Ceramic Bearings	Steel bearings
Bearing rings		High speed tool steel (M50)	
Balls	Material	Ceramic (Si_3N_4)	High speed tool steel (M50)
	Dia.	6.35 mm	
	Number of balls	9	
Cage		Polyimide resin	

Condition	Specification
Axial load	200 N
Rotational speed (max.)	100 000 min^{-1}
Lubricating oil	AeroShell Turbine Oil 500
Ambient temperature	Room temp.

Fig. 4-7 Comparison in power loss between Hybrid Ceramic Bearings and steel bearings

• Seizure limit at high speed

Fig. 4-8 shows the seizure limits of Hybrid Ceramic Bearings and steel bearings. The limits were measured by gradually reducing lubricating oil feed rate.

Compared with general purpose steel bearings, Hybrid Ceramic Bearings consume smaller amount of lubricating oil under the same speed condition, while they can run at a higher speed under the same luburicating oil feed rate condition.

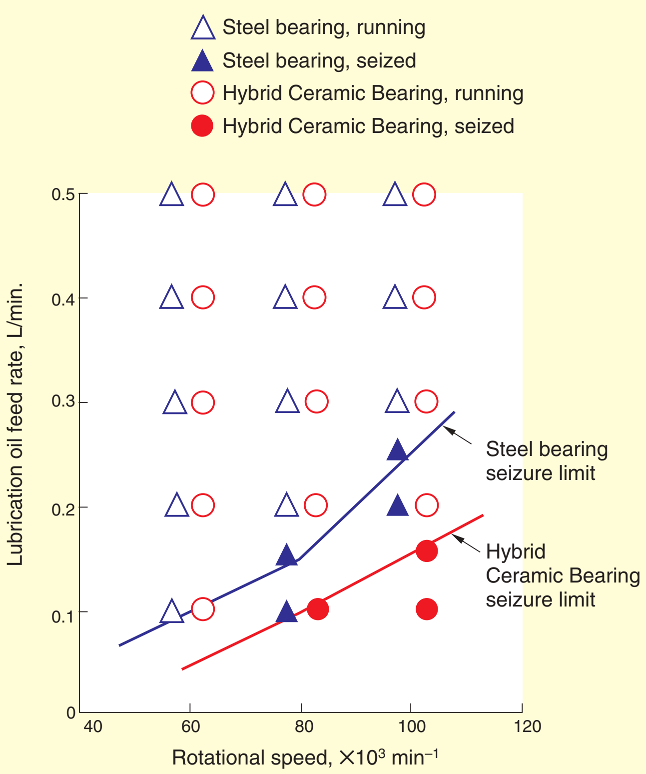

Fig. 4-8 Comparison between Hybrid Ceramic Bearings and steel bearings in seizure limit

2 EXSEV Bearings and Other EXSEV Products

For the use of bearings in an extreme, special environment, identifying the best combination of bearing materials and lubricants according to specific conditions is critical.
This chapter describes the component compositions and features of major EXSEV Bearing varieties.
For other EXSEV Bearings suited to more specialized applications, please consult JTEKT.

3 Radial Ball Bearings

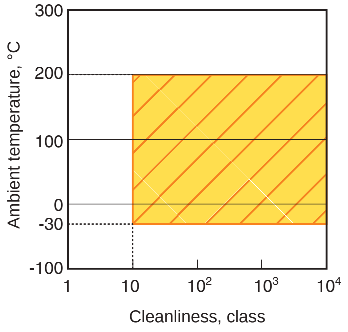
3-1 Clean Pro Bearing-RZ

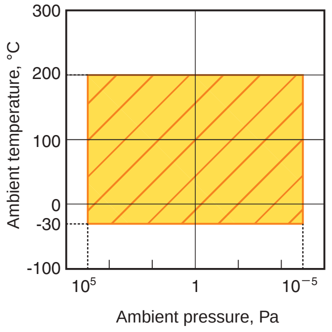
Clean Pro Bearing Series
Long-Service-Life Type

This bearing has a fluoropolymer gel coating on its rolling surfaces as the lubricant.

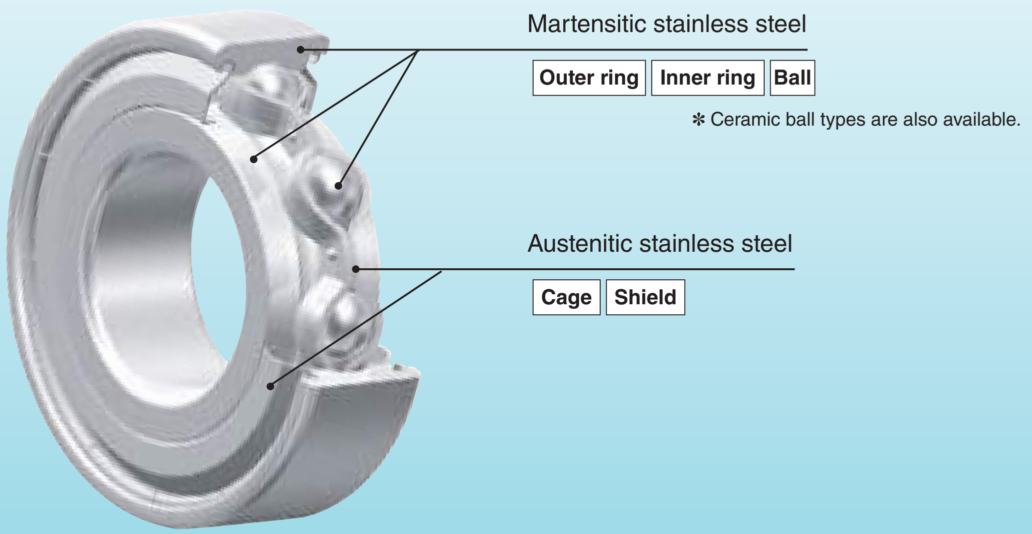
Applicable Environments

- **Clean**
- **Vacuum**
- High speed
- Corrosive
- Magnetic field
- Electric field
- High temperature
- Hygiene





Product Specifications



✻ Ceramic ball types are also available.

Bearing Numbering System

SE | Basic bearing number | ZZST**PRZ** YS

SE: Solid lubricant

PRZ: Clean Pro Bearing-RZ

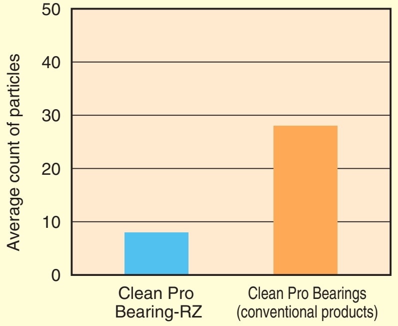
Applications

- Semiconductor manufacturing equipment
- Transfer systems
- Lithography equipment
- Vacuum motors
- Vacuum equipment

Performance

- Clean Pro Bearing-RZ has better characteristics in low particle emissions than Clean Pro Bearings (conventional products).

Comparison of particle emissions
(Particles 0.1μm or greater in diameter)

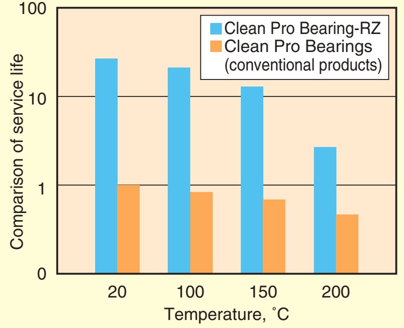


Test conditions

Bearing No.: 6000
Temperature: Atmosphere / room temperature
Rotational speed: 200min^{-1}, Load: Axial 30 N

- Clean Pro Bearing-RZ has longer service life than Clean Pro Bearings (conventional products).

Comparison of service life



Test conditions

Bearing No.: 6000, Rotational speed: 1200min^{-1}
Load: Axial 147 N, Atmosphere pressure: 10^{-3} Pa

- Clean Pro Bearing-RZ has better characteristics in low gas emission than Clean Pro Bearings (conventional products).

Lubricant service life expectancy equation

The average service life of Clean Pro Bearing-RZ can be estimated with the following equation.

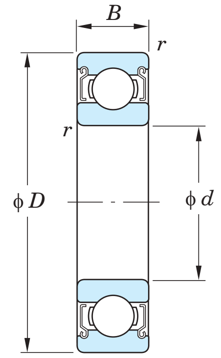
$$L_{av} = b_2 \cdot \left(\frac{C_r \times 0.85}{P_r}\right)^q \times 0.016667/n$$

Where,

L_{av} : Average life, h
b_2 : Lubrication factor
$b_2 = 420$
C_r : Basic dynamic load rating, N
P_r : Dynamic equivalent radial load, N
q : Exponential coefficient, $q = 3$
n : Rotational speed, min^{-1}

For the service life of solid lubricants, refer to page 13.

Dimensions Table



Dynamic equivalent load

$P_r = XF_r + YF_a$

(X and Y are as shown below.)

Static equivalent load

	80	18	1.1	**SE6208ZZSTPRZC3 YS**	29.1	17.8	14.0	1455	220

Notes 1) The basic load ratings are those of standard bearing (used to calculate lubrication life).
2) The permissible radial loads can be regarded as the maximum loads applicable to individual bearings. When an axial load is applied to the bearing, convert this axial load to a dynamic equivalent radial load, and then compare this value to the permissible radial load.

[Remarks] 1) Sizes other than those listed in this table are also available. Contact JTEKT for details.
2) Please note that you may be asked to provide information on applications and usage conditions when requesting an estimate.

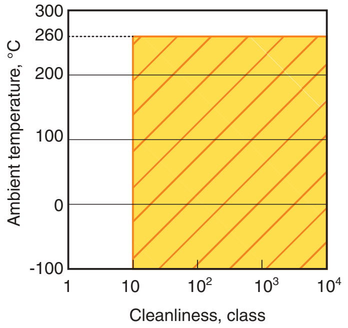
3-2 Clean Pro Bearing-RB

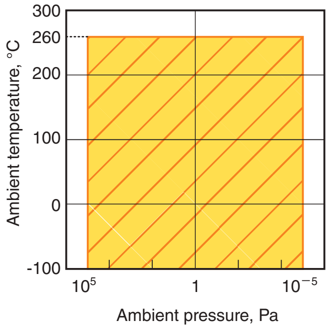
Supports 260˚C Clean, Vacuum Environments

This bearing has a fluoropolymer coating on its rolling surface as the lubricant.

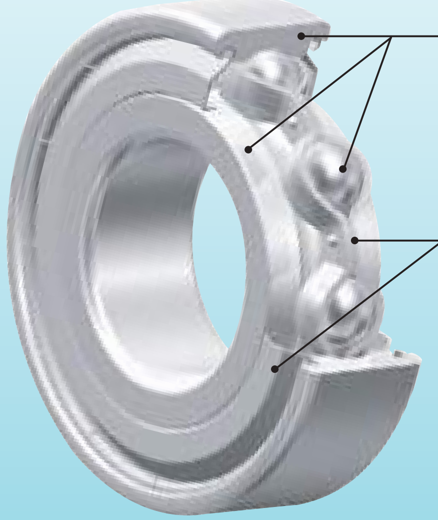
Applicable Environments

Clean	Magnetic field
Vacuum	Electric field
High speed	**High temperature**
Corrosive	Hygiene





Product Specifications



Martensitic stainless steel

Outer ring **Inner ring** **Ball**

✻ Ceramic ball types are also available.

Austenitic stainless steel

Cage **Shield**

Bearing Numbering System

SE Basic bearing number ZZST**PRB** YS

Solid lubricant

Clean Pro Bearing-RB

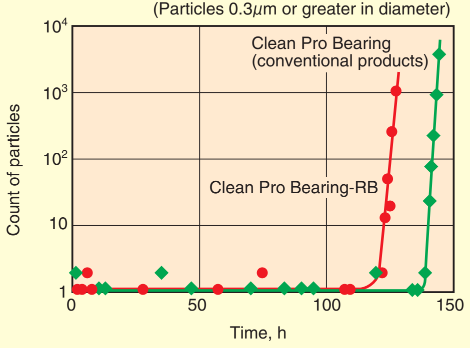
Applications

- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Transfer systems
- Vacuum equipment
- Sputtering equipment

Performance

- Comparable to the Clean Pro Bearing (conventional products) in low particle emissions.

Comparison of particle emissions
(Particles 0.3μm or greater in diameter)

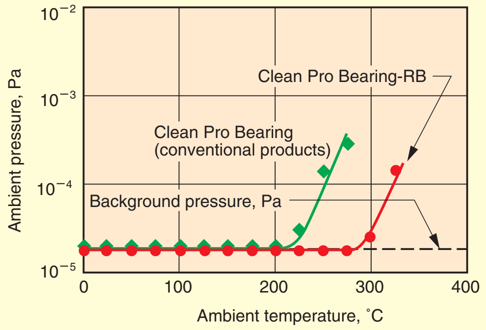


- **Test conditions**

Bearing No.: 608
Temperature: Atmosphere / room temperature
Rotational speed: 200min^{-1}, Load: Axial 100 N

- Compatible with temperatures of up to 260˚C in a vacuum.

Gas emission characteristics



- **Test conditions**

Bearing No.: 608

[Remarks] 1) Bearings with a radial internal clearance of C4 are also available.
2) Sizes other than those listed in this table are also available. Contact JTEKT for details.
3) Please note that you may be asked to provide information on applications and usage conditions when requesting an estimate.

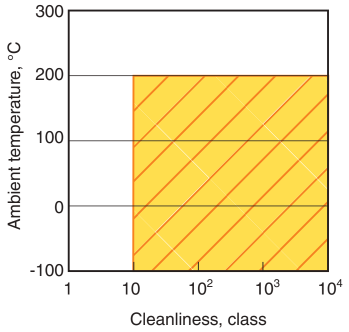
3-3 New Clean Pro Bearing-PR

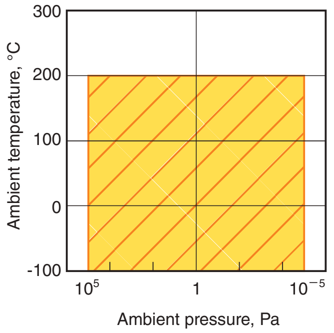
For Clean Rooms, Vacuum Equipment

This bearing is lubricated with a fluoropolymer coating over the entire surface of all bearing components.

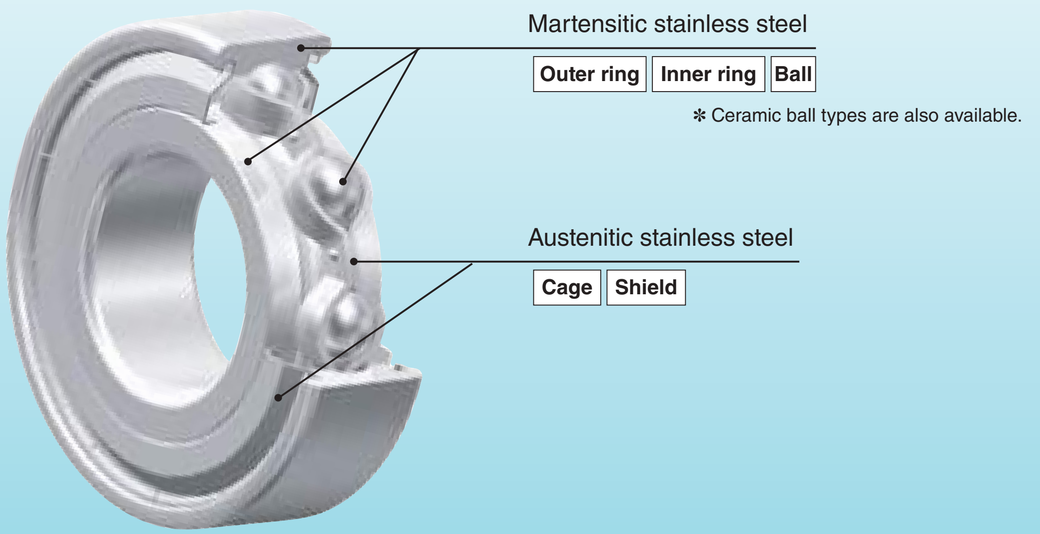
Applicable Environments

Clean	Magnetic field
Vacuum	Electric field
High speed	High temperature
Corrosive	Hygiene





Product Specifications



✻ Ceramic ball types are also available.

Bearing Numbering System

SE Basic bearing number ZZST**PR** YS

SE: Solid lubricant

PR: New Clean Pro Bearing-PR

Applications

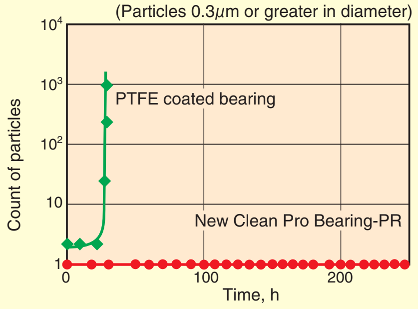
- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Vacuum equipment
- Lithography equipment
- Sputtering equipment
- Vacuum motors

Performance

- Suitable for use in clean environments due to low particle emissions.

Comparison of particle emissions

(Particles 0.3μm or greater in diameter)

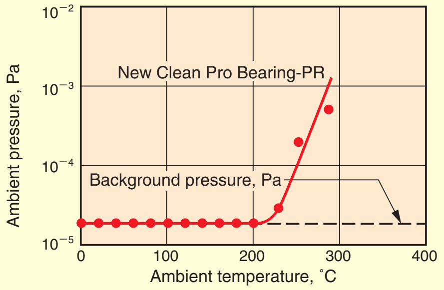


Test conditions

Bearing No.: 608
Temperature: Atmosphere / room temperature
Rotational speed: 200min^{-1}, Load: Axial 20 N

- Stable performance up to 200°C in a vacuum.

Gas emission characteristics



Test conditions

Bearing No.: 608

Lubricant service life expectancy equation

The average service life of New Clean Pro Bearing-PR can be estimated by the following equation:

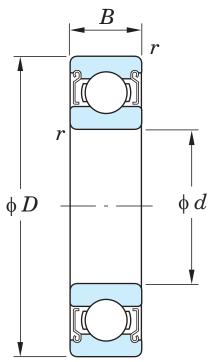
$$L_{av} = b_2 \cdot \left(\frac{C_r \times 0.85}{P_r}\right)^q \times 0.016667/n$$

Where,

L_{av} : Average life, h
b_2 : Lubrication factor
$b_2 = 420$
C_r : Basic dynamic load rating, N
P_r : Dynamic equivalent radial load, N
q : Exponential coefficient, $q = 3$
n : Rotational speed, min^{-1}

For the service life of solid lubricants, refer to page 13.

Dimensions Table



Dynamic equivalent load
$P_r = XF_r + YF_a$
(X and Y are as shown below.)
Static equivalent load
$P_{0r} = 0.6F_r + 0.5F_a$

Notes 1) The basic load ratings are those of standard bearing (used to calculate lubrication life).
2) The permissible radial loads can be regarded as the maximum loads applicable to individual bearings. When an axial load is applied to the bearing, convert this axial load to a dynamic equivalent radial load, and then compare this value to the permissible radial load.

[Remarks] 1) Sizes other than those listed in this table are also available. Contact JTEKT for details.
2) Please note that you may be asked to provide information on applications and usage conditions when requesting an estimate.

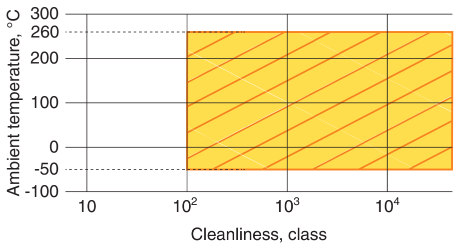
3-4 EXSEV®-EX

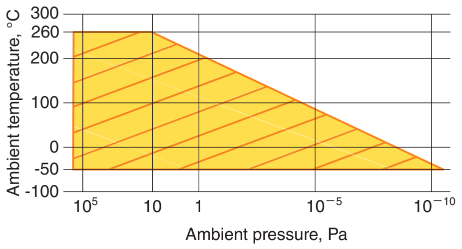
The Lubricating Properties of Grease in Clean / Vacuum Applications

This bearing is lubricated with the packed fluorinated EXSEV®-EX (Grease), which is suitable for use in clean environments and vacuum environments.
Compliant with environmental regulations (does not contain PFOA)

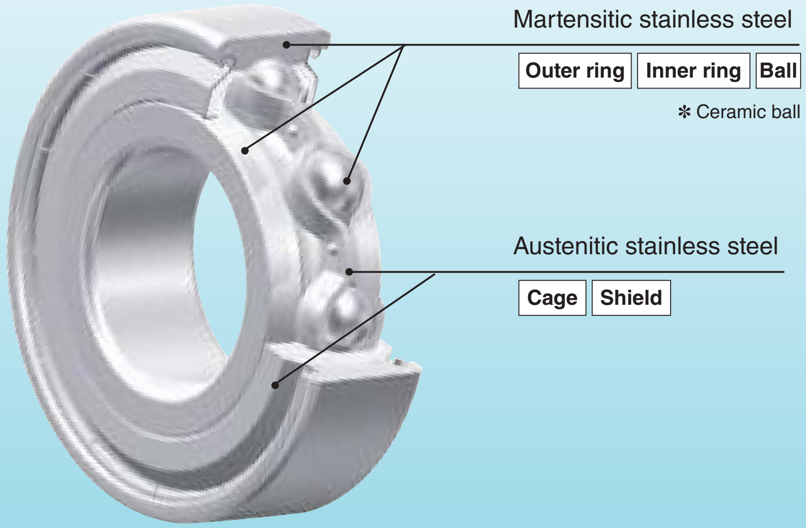
Applicable Environments

Clean Magnetic field
Vacuum Electric field
High speed **High temperature**
Corrosive Hygiene





Product Specifications



✻ Ceramic ball types are also available.

Bearing Numbering System

SV | Basic bearing number | ZZST YS EX

Solid lubricant

✻ For details on EXSEV®-EX (grease), refer to page 94.

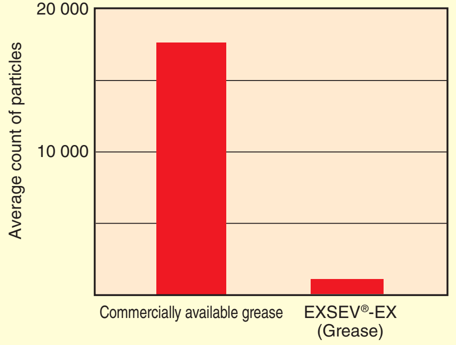
Applications

- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Transfer robots
- Vacuum pumps

Performance

- Suitable for clean and vacuum applications thanks to low particle emissions.

Comparison of particle emissions
(Particles 0.1 μm or greater in diameter)



- **Test conditions**

Bearing No.: 6000
Temperature: Atmosphere / room temperature
Rotational speed: 450min^{-1}
Load: Radial 10 N
Filled amount: 25%

Grease properties

Name	EXSEV®-EX (Grease)
Thickener	PTFE
Base oil	PFPE
Dropping point	None
Evaporation (99°C×24h)	0.1wt%max.
Oil separation (100°C×24h)	2wt%max.
Operating temperature range	–50 to 260°C

Dimensions Table

Notes 1) The basic load ratings are those of bearing made from SUS440C.
To calculate dynamic equivalent radial loads, multiply the C_{0r} value in this table by 1.25.
2) The limiting speed is that determined based on the condition that the cleanliness requirement is class 100.
[Remarks] 1) Sizes other than those listed in this table are also available. Contact JTEKT for details.
2) Please note that you may be asked to provide information on applications and usage conditions when requesting an estimate.

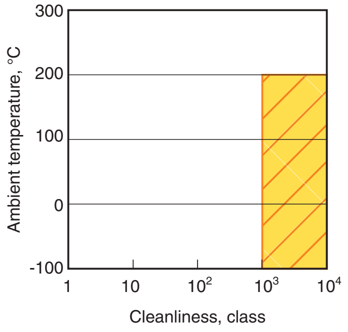
Basic Specification for Supporting Clean, Vacuum Environments

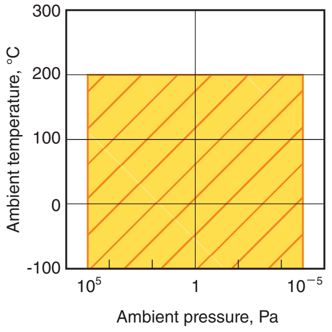
3-5 EXSEV®-FA

This bearing is lubricated with a solid fluoropolymer lubricant,which offers superior lubrication performance. The cage is made from a low-particle-emission fluorocarbon resin.

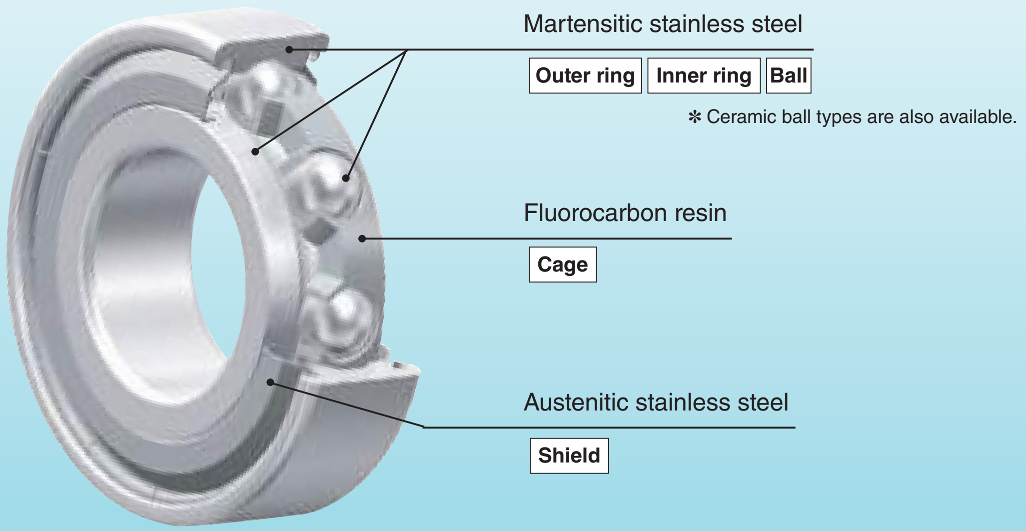
Applicable Environments

- **Clean**
- Magnetic field
- **Vacuum**
- Electric field
- High speed
- High temperature
- Corrosive
- Hygiene





Product Specifications



＊Ceramic ball types are also available.

Bearing Numbering System

SE Basic bearing number ZZST **FA**

SE: Solid lubricant

FA: Molded fluorocarbon resin cage

Applications

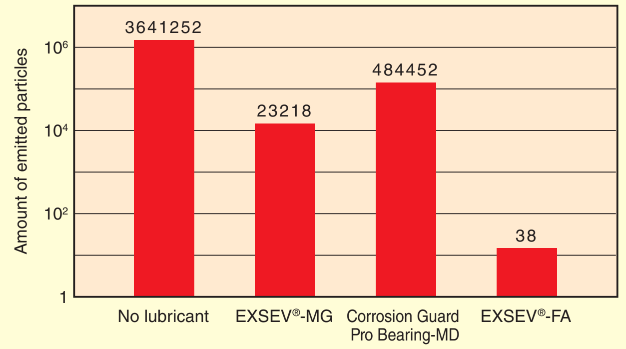
- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Transfer systems
- Inspection systems

Performance

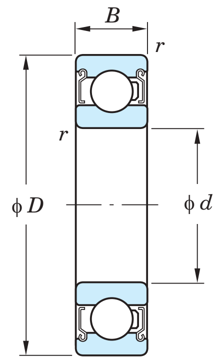
Test conditions

Tested bearing	ML6012 equivalent (ϕ6×12×3)
Rotational speed	200min^{-1}
Radial load	2.9 N/2 bearings
Ambience	In Class 10 clean bench, room temperature
Test time	20h
Measured particle size	Particle size 0.3μm or larger

Comparison of total emitted particles during a 20-hour test



Dimensions Table



Dynamic equivalent load

$$P_r = XF_r + YF_a$$

(X and Y are as shown below.)

Static equivalent load

$$P_{0r} = 0.6F_r + 0.5F_a$$

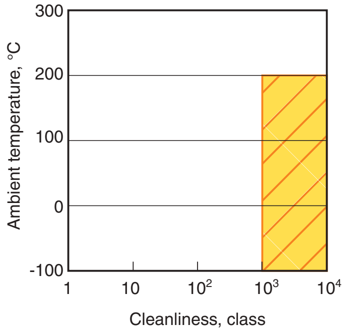
3-7 Corrosion Guard Pro Bearing-SN

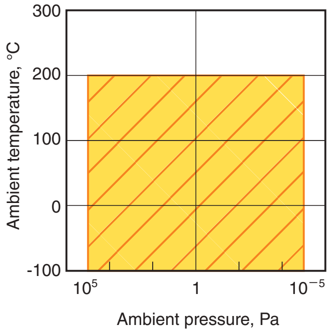
Silicon Nitride with Increased Corrosion Resistance

This bearing has its components made of corrosion resistant silicon nitride and is lubricated with fluoropolymer. This bearing can be used even in a highly corrosive solution.

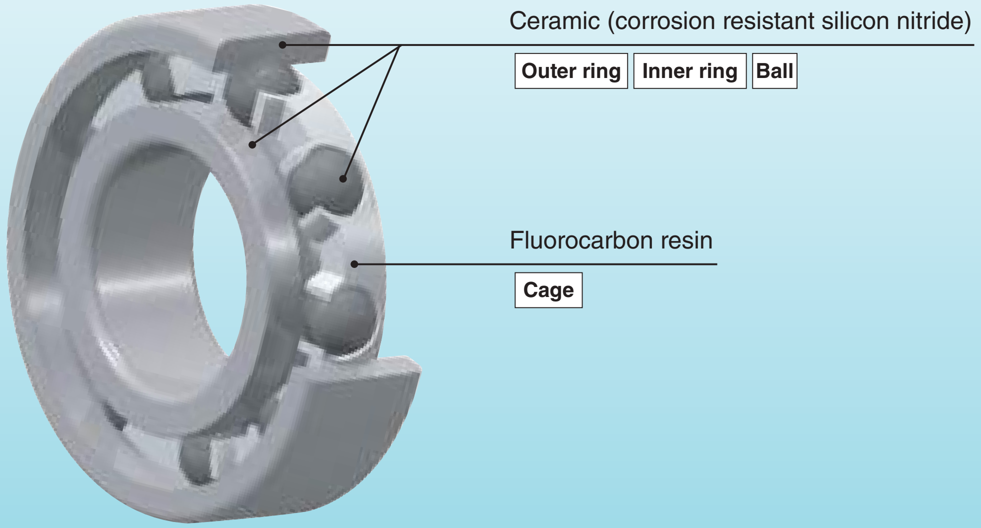
Applicable Environments

Clean	Magnetic field
Vacuum	Electric field
High speed	High temperature
Corrosive	Hygiene





Product Specifications



Bearing Numbering System

NCT Basic bearing number **FA**

NCT: Corrosion Guard Pro Bearing-SN

FA: Molded fluorocarbon resin cage

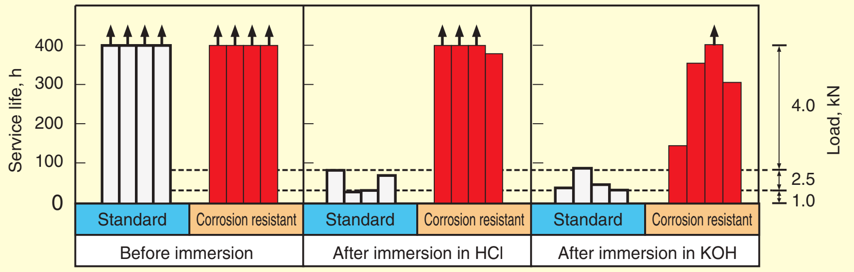
Applications

- Liquid crystal film manufacturing equipment
- Aluminum electrolytic capacitor manufacturing equipment
- Plating equipment
- Synthetic fiber manufacturing equipment
- Food container washing machine

Performance

- In an acid or alkaline solution, this bearing has a longer service life than bearings made from standard silicone nitride.

Comparison in service life after immersion in acid or alkaline solutions



- **Test conditions**
  Lubricant : Spindle oil
  Ball : Bearing steel
  Load : Increased in stages at every 1.08×10^7 cycles
  Rotational speed : 1 200 min^{-1}

- **Evaluate equipment**

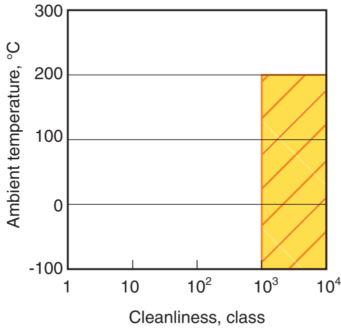
Using Ceramics for Various Applications

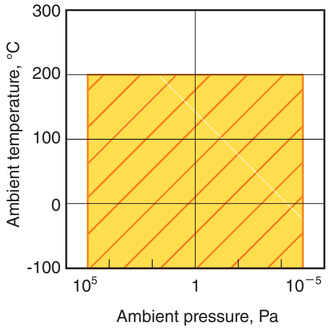
3-8 Ceramic Bearings

This bearing has its components made of silicon nitride ceramic and uses fluoropolymer as the lubricant. It is typically used in vacuum and corrosive environments.

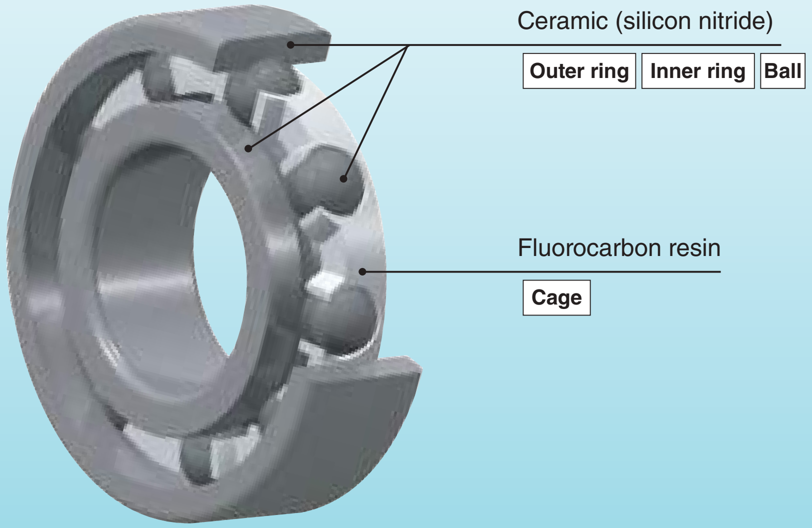
Applicable Environments

Clean
Magnetic field
Vacuum
Electric field
High speed
High temperature
Corrosive
Hygiene





Product Specifications



Bearing Numbering System

NC | Basic bearing number | **FA**

Ceramic bearing
Molded fluorocarbon resin cage

Applications

- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Semiconductor inspection equipment
- Synthetic fiber manufacturing equipment
- Canning machinery
- Ultrasonic motors

Performance

- This Ceramic Bearing can be used under water; however, when used in a liquid with poor lubrication characteristics, the load exerted on the bearing should be no higher than 10% of the bearing's basic dynamic load rating. Also note that the fatigue life of the bearing is 3% of its rating life under water.
- When this Ceramic Bearing is not used under water, select one based on the permissible radial load and limiting speed specified in the Dimensions Table.

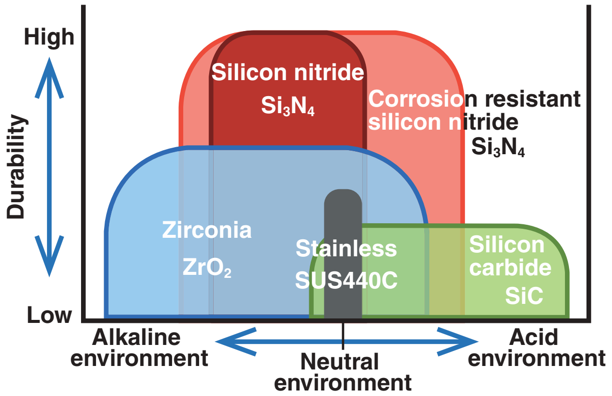
3-9 Corrosion Guard Pro Bearing-ZO

This bearing uses ceramic (zirconia) for its material and is lubricated with the solid lubricant of the molded PEEK resin cage. It can be used in corrosive liquids or water and also has excellent impact resistance.

Applicable Environments

Clean	Magnetic field
Vacuum	Electric field
High speed	High temperature
Corrosive	Hygiene



Product Specifications

＊A type with an aligning ring is also available as an option.

3NC Basic bearing number ZZ**MD4** **FA**

Hybrid ceramic bearing

Molded fluorocarbon resin cage

Corrosion Guard Pro Bearing-MD

Applications

- Semiconductor manufacturing equipment
- Chemical manufacturing equipment
- Food machinery
- Cleaning equipment

Performance

- When this Corrosion Guard Pro Bearing-MD is used under water, its service life is determined depending on the rust and/or wear of bearing rings. The service life cannot be estimated correctly from the rating life.
- When this Corrosion Guard Pro Bearing-MD is not used under water, select one based on the allowable radial load and limiting speed specified in the Dimensions Table.

3-11 EXSEV®-SK

The Standard for Stainless Steel Bearings

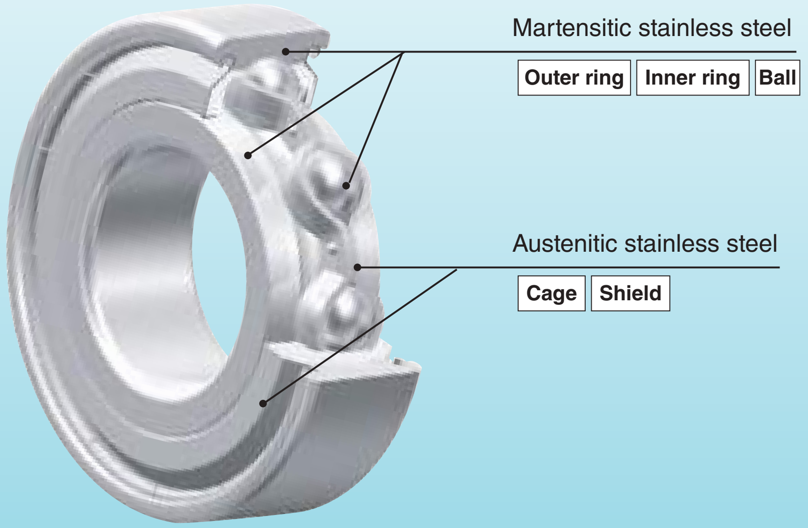
This bearing has its components made of stainless steel, and is lubricated with lithium containing EXSEV®-KHD (Grease), which is packed in adequate amounts. This bearing is suitable for use in slightly corrosive environments.

Applicable Environments

Clean
Magnetic field
Vacuum
Electric field
High speed
High temperature
Corrosive
Hygiene

- Temperature: – 30 to 120˚C
- Ambient pressure: Atmospheric pressure
- Unsuitable for clean environments due to anticorrosive treatment.

Product Specifications



Bearing Numbering System

SK | Basic bearing number | ZZ (2RS) ST YS HX

EXSEV®-SK

Applications

- Chemical equipment
- Transfer systems

Grease Properties

Grease properties

Name	EXSEV®-KHD (Grease)
Thickener	Lithium soap
Base oil	Poly α olefin
Dropping point	203˚C
Evaporation (99˚C × 22h)	0.14wt%
Oil separation (100˚C × 24 h)	0.1wt%
Operating temperature range	–30 to 120˚C

Grease life can be estimated by the following equation.

$$\log L = 6.10 - 4.40 \times 10^{-6} d_m n - 2.50 \left(\frac{P_r}{C_r} - 0.05\right) - (0.021 - 1.80 \times 10^{-8} d_m n)\, T$$

where :

L : grease life, h

$d_m = \frac{D + d}{2}$ (D : outside diameter, d : bore diameter), mm

n : rotational speed, min^{-1}

P_r : dynamic equivalent radial load, N

C_r : basic dynamic radial load rating, N

T : operating temperature of bearing, ˚C

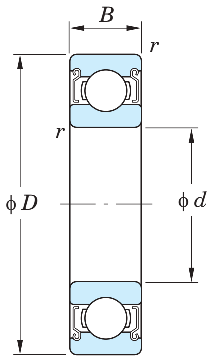
The conditions for applying equation are as follows :

a) Operating temperature of bearing : T ˚C
Applicable when $T \leqq 120$
〔when $T < 50$, $T = 50$〕
When $T > 120$, please contact with JTEKT.

b) Value of $d_m n$
Applicable when $d_m n \leqq 500 \times 10^3$
〔when $d_m n < 125 \times 10^3$, $d_m n = 125 \times 10^3$〕
When $d_m n > 500 \times 10^3$, please contact with JTEKT.

c) Load condition : $\frac{P_r}{C_r}$
Applicable when $\frac{P_r}{C_r} \leqq 0.2$
〔when $\frac{P_r}{C_r} < 0.05$, $\frac{P_r}{C_r} = 0.05$〕
When $\frac{P_r}{C_r} > 0.2$, please contact with JTEKT.

Dimensions Table



Dynamic equivalent load
$P_r = XF_r + YF_a$
(X and Y are as shown below.)

[Remarks] 1) Sizes other than those listed in this table are also available. Contact JTEKT for details.
2) Please note that you may be asked to provide information on applications and usage conditions when requesting an estimate.

3-13 EXSEV®-XT

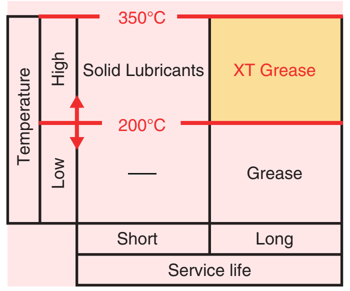
Long service life with grease lubrication even at 350˚C

The bearings are filled with fluorinated grease capable of handling high temperatures even up to 350˚C.

Applicable Environments

- Clean
- Magnetic field
- [✓ Vacuum]
- Electric field
- High speed
- [✓ High temperature]
- Corrosive
- Hygiene

Operating range



Temperature			
	High	Solid Lubricants	XT Grease
	Low	—	Grease
		Short	Long

Note 1) The basic load ratings are those of bearing made from SUS440C.
To calculate dynamic equivalent radial loads, multiply the C_{0r} value in this table by 1.25.

[Remarks] 1) Sizes other than those listed in this table are also available. Contact JTEKT for details.
2) Please note that you may be asked to provide information on applications and usage conditions when requesting an estimate.

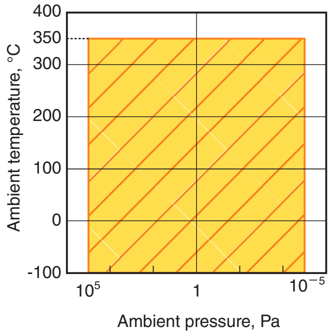
3-14 EXSEV®-WS

Combines 350˚C Heat Resistance and Load Carrying Capability

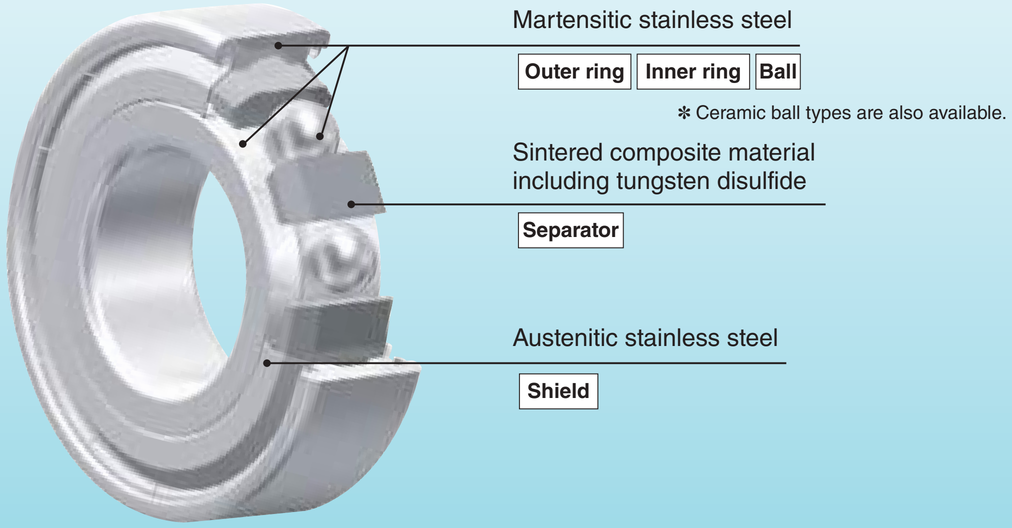
This bearing has extremely heat resistant tungsten disulfide included in the separator material as the lubricant.

Applicable Environments

Clean	Magnetic field
Vacuum	Electric field
High speed	**High temperature**
Corrosive	Hygiene



Product Specifications



✻ Ceramic ball types are also available.

Bearing Numbering System

SE Basic bearing number ZZST **WS**

SE: Solid lubricant

WS: Separators including tungsten disulfide

Applications

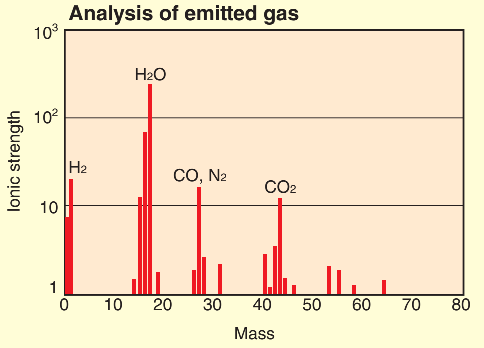
- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Vacuum evaporatior
- Plasma display panel manufacturing equipment

✻ We recommend that this bearing is used with horizontal axes. For information on using this bearing with items other than horizontal axes, consult JTEKT.

Performance

- Free from problematic gas emissions under the conditions of up to 10^{-5} Pa and up to 350˚C.

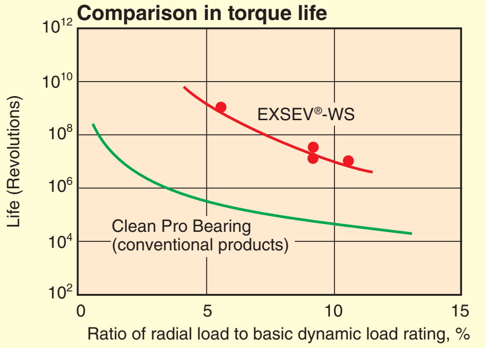
Analysis of emitted gas



- **Test conditions**
  Bearing No.: 608

- Highly heat resistant and superior to the Clean Pro Bearing (conventional products) in lubrication life.

Comparison in torque life



- **Test conditions**
  Bearing No.: 608, Rotational speed: 500min^{-1}
  Atmosphere pressure: 10^{-3} Pa

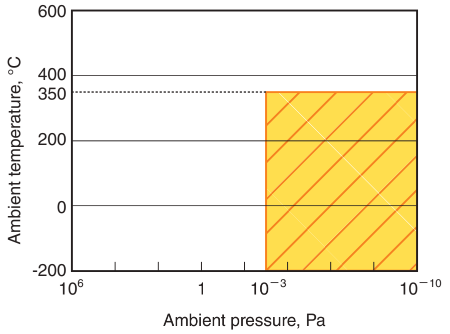
3-15 EXSEV®-MG

Supports Ultra-high Temperature Vacuums

This bearing has silver ion plated on the stainless steel balls, as the lubricant.

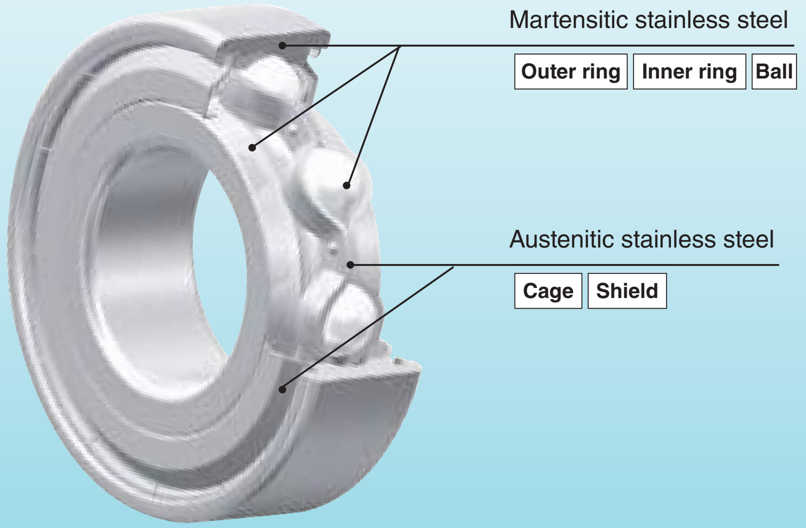
Applicable Environments

Clean	Magnetic field
Vacuum	Electric field
High speed	**High temperature**
Corrosive	Hygiene



* As much as possible, avoid bringing these bearings in contact with the atmosphere.

Product Specifications



Bearing Numbering System

SE Basic bearing number ZZST **MG3** YS

Solid lubricant (SE)

Silver ion plated balls (MG3)

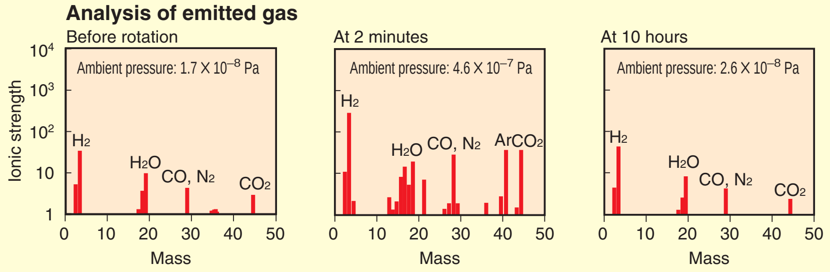
Applications

- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Vacuum evaporator
- Medical equipment
- Vacuum motors

Performance

- Useful in an ultrahigh vacuum environment of 10^{-10} Pa thanks to low gas emissions in an ultrahigh vacuum.

Analysis of emitted gas



- **Test conditions**

  Temperature: Atmosphere / room temperature, Load: Radial 3 N · Axial 98 N
  Ambient pressure: 1.3 × 10^{-8} Pa (1.0 × 10^{-10} Torr), Rotational speed: 140min^{-1}

Lubricant service life expectancy equation

The average service life of bearings with silver ion-plated balls (EXSEV®-MG) can be estimated with the following equation.

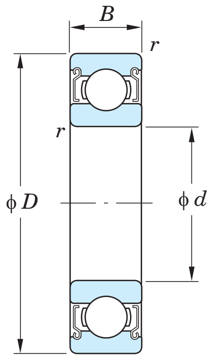
$$L_{vh} = b_1 \cdot b_2 \cdot b_3 \left(\frac{C_r}{13 \times P_r}\right)^q \times 16\,667/n$$

Where,

L_{vh} : 90% confidence service life, h
C_r : Basic dynamic load rating, N
P_r : Dynamic equivalent radial load, N
q : Exponential coefficient, $q = 1$
n : Rotational speed, min^{-1} However, $10 \leqq n \leqq 10\,000$
b_1 : Speed factor
$b_1 = 1.5 \times 10^{-3} n + 1$
b_2 : Lubrication factor
$b_2 = 1$
b_3 : Atmosphere pressure/temperature dependency coefficient
$b_3 = 1$ (when 10^{-3} Pa, room temperature)

For the service life of solid lubricants, refer to page 13.

Dimensions Table



Dynamic equivalent load

$P_r = XF_r + YF_a$

(X and Y are as shown below.)

Static equivalent load

$P_{0r} = 0.6F_r + 0.5F_a$

When P_{0r} is smaller than F_r .

$P_{0r} = F_r$

	80	18	1.1	**SE6208ZZSTMG3C4 YS**	29.1	17.8	14.0	875	220

Notes 1) The basic load ratings are those of standard bearing (used to calculate lubrication life).
2) The permissible radial loads can be regarded as the maximum loads applicable to individual bearings. When an axial load is applied to the bearing, convert this axial load to a dynamic equivalent radial load, and then compare this value to the permissible radial load.

[Remarks] 1) Sizes other than those listed in this table are also available. Contact JTEKT for details.
2) Please note that you may be asked to provide information on applications and usage conditions when requesting an estimate.

3-16 EXSEV®-PN

Superior Heat Resistance Supporting 300˚C

This bearing has a highly heat resistant solid lubricant, such as molybdenum disulfide included in the cage material.

Applicable Environments

2) Please note that you may be asked to provide information on applications and usage conditions when requesting an estimate.

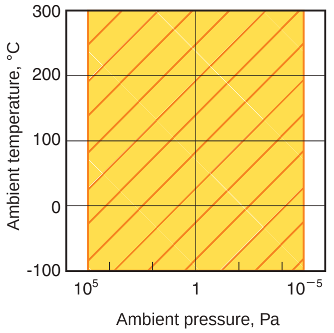
3-17 EXSEV®-MO

Basic Specification for 300˚C Support

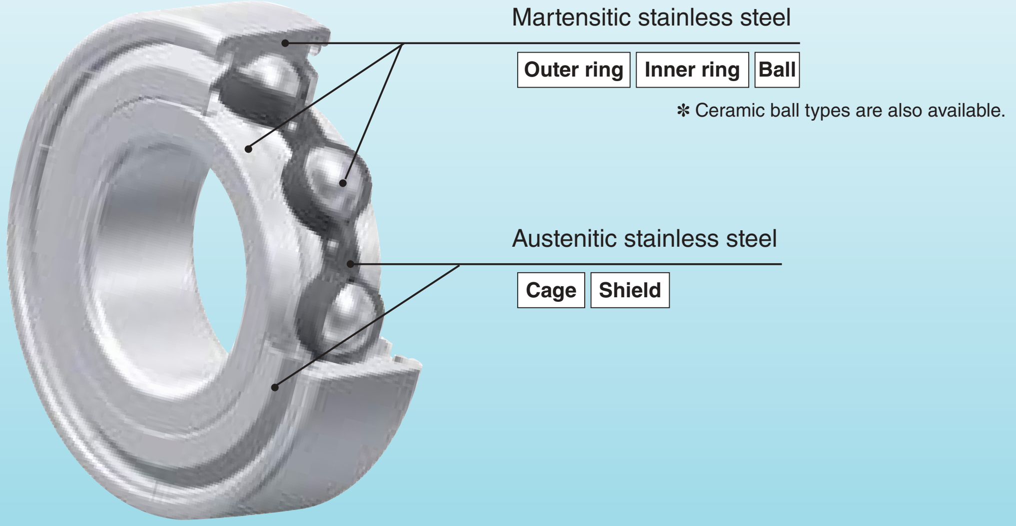
This bearing has molybdenum disulfide baked on the surface of the stainless steel cage, as the lubricant.

Applicable Environments

Clean
Magnetic field
Vacuum
Electric field
High speed
High temperature
Corrosive
Hygiene



Product Specifications



✻ Ceramic ball types are also available.

Bearing Numbering System

SE Basic bearing number ZZST **MSA7** YS

Solid lubricant

Molybdenum disulfide baked stainless steel cage

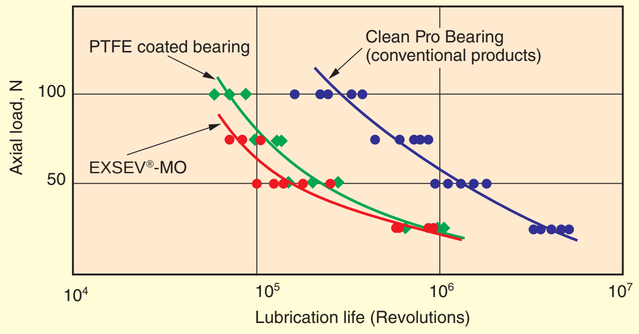
Applications

- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Vacuum evaporator
- Turbo molecular pump
- Rotary furnaces

Performance

- Molybdenum disulfide compares to the common PTFE coating in lubrication life but is superior in heat resistance.

Comparison in lubrication life



- **Test conditions**
  Bearing No.: 608

Lubricant service life expectancy equation

The average service life of EXSEV bearings with the cage coated with molybdenum disulfide (EXSEV®-MO) can be estimated with the following equation.

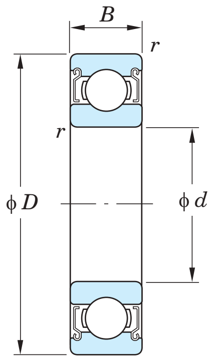
$$L_{av} = b_2 \cdot \left(\frac{C_r \times 0.85}{P_r}\right)^q \times 0.016667/n$$

Where,

L_{av} : Average life, h
b_2 : Lubrication factor
$b_2 = 6$
C_r : Basic dynamic load rating, N
P_r : Dynamic equivalent radial load, N
q : Exponential coefficient, $q = 3$
n : Rotational speed, min^{-1}

For the service life of solid lubricants, refer to page 13.

Dimensions Table



Dynamic equivalent load

$P_r = XF_r + YF_a$

(X and Y are as shown below.)

Static equivalent load

$P_{0r} = 0.6F_r + 0.5F_a$

When P_{0r} is smaller than F_r .

$P_{0r} = F_r$

	80	18	1.1	**SE6208ZZSTMSA7C3 YS**	29.1	17.8	14.0	875	220

Notes 1) The basic load ratings are those of standard bearing (used to calculate lubrication life).
2) The permissible radial loads can be regarded as the maximum loads applicable to individual bearings. When an axial load is applied to the bearing, convert this axial load to a dynamic equivalent radial load, and then compare this value to the permissible radial load.

[Remarks] 1) Sizes other than those listed in this table are also available. Contact JTEKT for details.
2) Please note that you may be asked to provide information on applications and usage conditions when requesting an estimate.

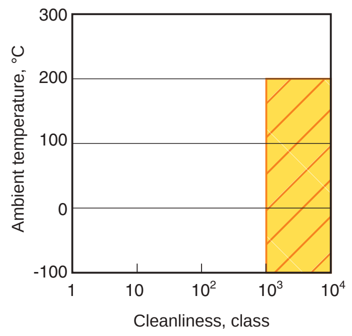
3-18 Non-magnetic Hybrid Ceramic Bearings

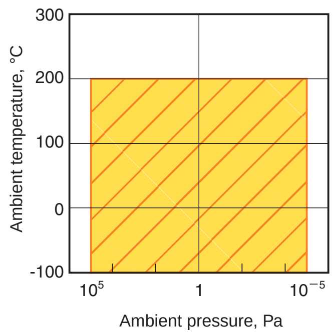
Non-magnetic Support in Stainless Steel

This bearing uses non-magnetic stainless steel. It includes fluoropolymer as the lubricant. This bearing can be used in a vacuum environment.

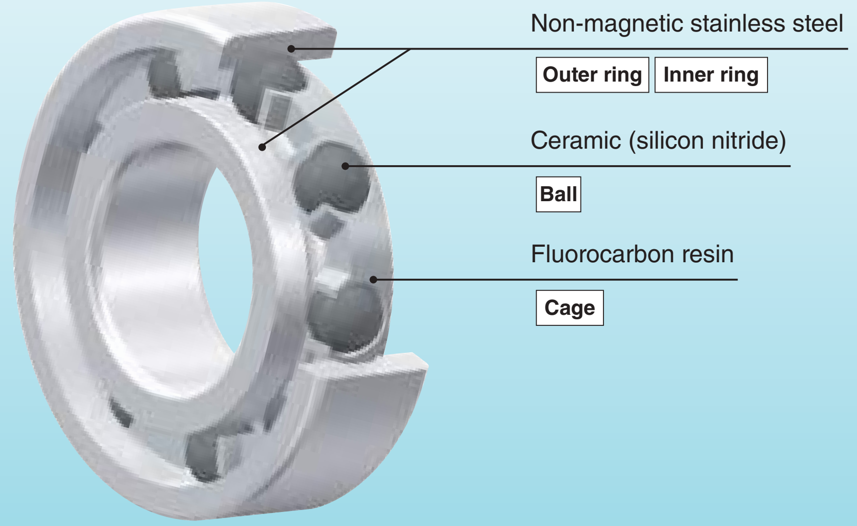
Applicable Environments

- Clean
- Magnetic field
- Vacuum
- Electric field
- High speed
- High temperature
- Corrosive
- Hygiene





Product Specifications



Bearing Numbering System

3NC Basic bearing number **YH4** **FA**

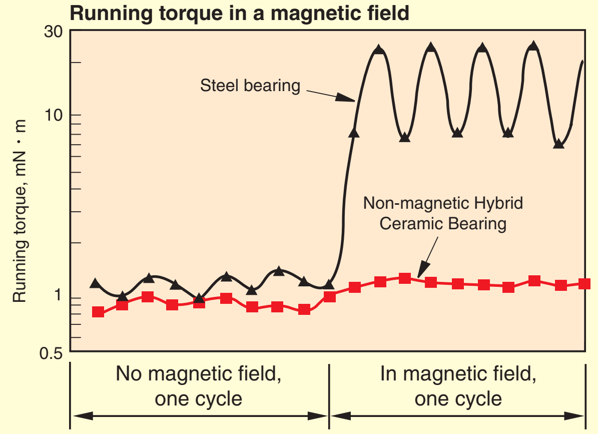
3NC: Hybrid ceramic bearing
YH4: Non-magnetic stainless steel
FA: Molded fluorocarbon resin cage

Applications

- Semiconductor manufacturing equipment
- Semiconductor inspection equipment
- Canning machinery
- Superconductivity-related equipment
- Welder

Performance

- While steel bearings experience fluctuating running torque, caused by magnetic fields, this bearing rotates at a stable torque.



- **Test conditions**
  Bearing No.: 6206

3-19 Hybrid Ceramic Bearings

For Insulation and High-speed Applications

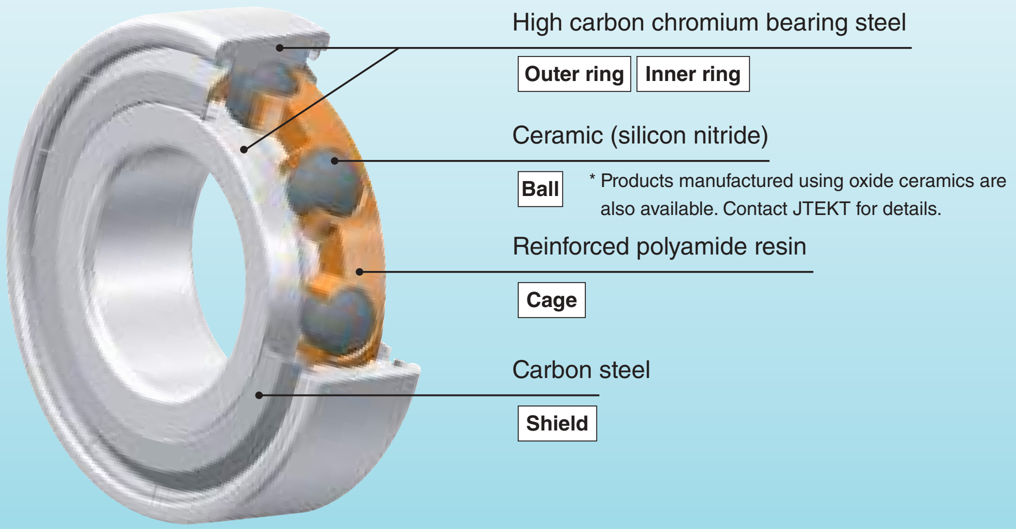
This bearing is a standard hybrid ceramic bearing. Lubricated with grease or oil, it can be used as an insulating bearing or high speed bearing.

Applicable Environments

Clean	Magnetic field
Vacuum	**Electric field**
High speed	High temperature
Corrosive	Hygiene

- Temperature: – 30 to 120˚C
- Ambient pressure: Atmospheric pressure

Product Specifications



* Products manufactured using oxide ceramics are also available. Contact JTEKT for details.

Bearing Numbering System

3NC | Basic bearing number | ZZ FG

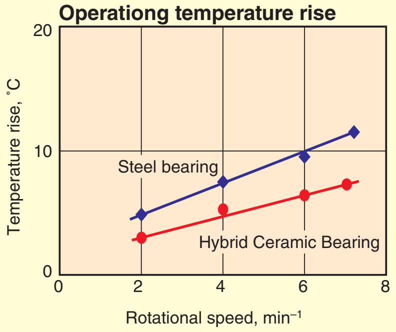
Hybrid ceramic bearing

Applications

- High speed stranding machine guide rollers
- Motors
- Generators

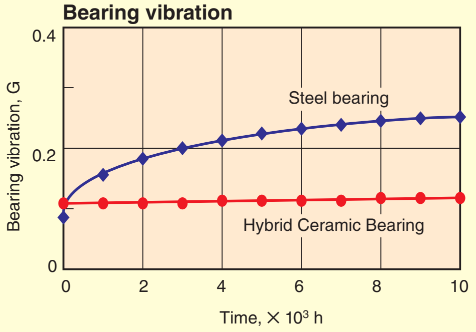
Performance

- Reduced temperature rises.



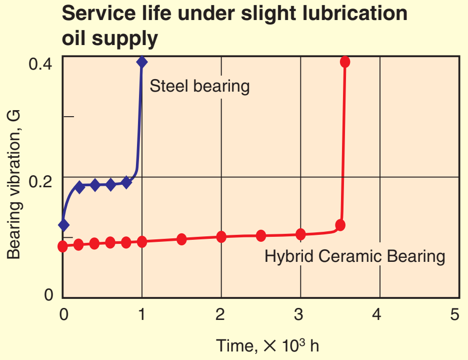
Test conditions
Bearing No.: 6312
Rotational speed: 2000 ～ 7000 min^{-1}
Load: Radial 2.94 kN

- Reduced bearing vibration.



Test conditions
Bearing No.: 696 Temperature: 70˚C
Rotational speed: 15000 min^{-1}
Load (Preload) : 14.2 N (Position preloading)

- Good antiseizure characteristics.



Test conditions
Bearing No.: 695 Temperature: 70˚C
Rotational speed: 7200 min^{-1}
Load (Preload) : 14.7 N (Constant pressure preloading)

Note 1) The basic load ratings are those of the Hybrid Ceramic Bearing.
To calculate its dynamic equivalent radial load, multiply the C0r values in this table by 1.176.
[Remarks] 1) Sizes other than those listed in this table are also available. Contact JTEKT for details.
2) Please note that you may be asked to provide information on applications and usage conditions when requesting an estimate.

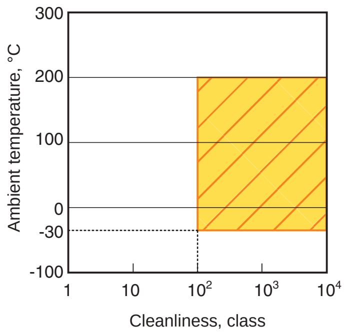
4 K Series Full Complement Hybrid Ceramic Ball Bearings

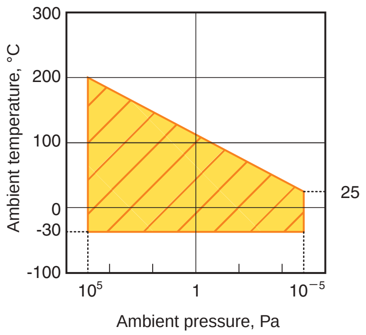
Clean Specification for Super Thin Section Ball Bearings

This bearing is based on the K series super thin section ball bearing, which is widely used in industrial robots. Provided with some adaptations, this bearing is compatible with clean or vacuum environments. It uses fluorinated EXSEV®-EX (Grease) as the standard lubricant. However, please consult with us regarding New Clean Pro Bearing-PR and other solid lubricants.

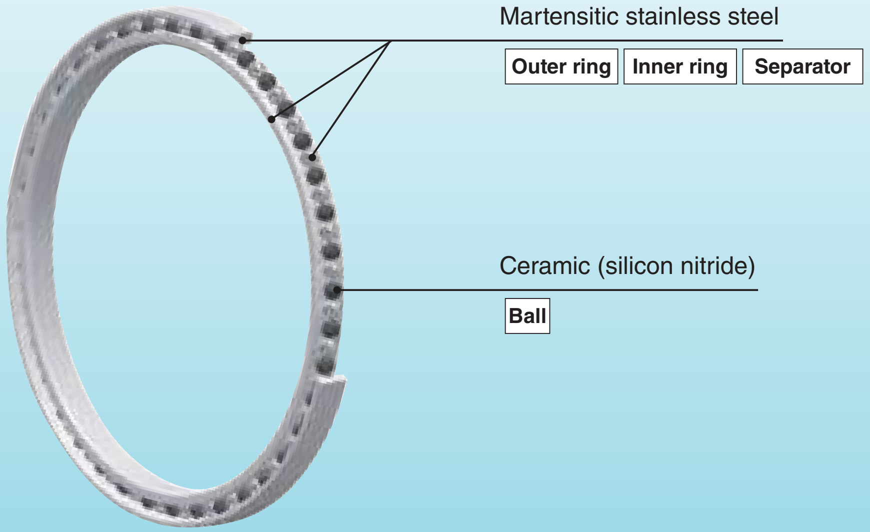
Applicable Environments

Clean	Magnetic field
Vacuum	Electric field
High speed	High temperature
Corrosive	Hygiene





Product Specifications



Bearing Numbering System

3NC Basic bearing number **VST-1**

Hybrid ceramic bearing — Full complement type

Applications

- Wafer transfer robot
- Semiconductor manufacturing equipment
- LCD manufacturing equipment

Types and Dimension Series

- The K series super thin section ball bearing is available in three types: deep groove type, angular contact type and four point contact type.
- The cross section can be selected from among three sizes: 4.762, 6.35 and 7.938 (mm).
- For use in a clean or vacuum environment, the angular contact type, which has stainless steel balls and ceramic balls alternately, is available in series.

  Products not listed in the Dimensions Table are available to order. Please consult JTEKT.

Dimension series code	Cross sectional dimension $B = E$ mm	Bearing type code C (Deep groove type)	 A (Angular contact type)	 X (4 point contact type)	Bore dia. mm

Note 1) The basic load ratings are those of bearing made from SUS440C.

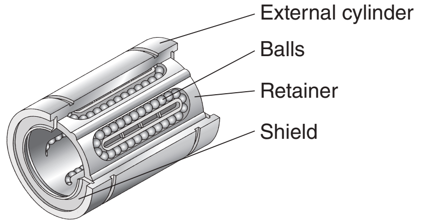
[Remarks] 1) Sizes other than those listed in this table are also available. Contact JTEKT for details.

2) Please note that you may be asked to provide information on applications and usage conditions when requesting an estimate.

5 Linear Motion Bearings

5-1 Linear Motion Ball Bearings for Use in Extreme Special Environments

The linear motion ball bearings are a high precision product that moves linearly in axial directions while having rolling contact with the shaft. Having balls, retainer and shields housed in an external cylinder, this compact bearing moves linearly without limit to the stroke distance.



Bearing Types

		EXSEV®-EX (Linear Motion Ball Bearings)	New Clean Pro Bearing-PR (Linear Motion Ball Bearings)	EXSEV®-MG (Linear Motion Ball Bearings)	EXSEV®-MO (Linear Motion Ball Bearings)	Hybrid Ceramic Linear [1)] Motion Ball Bearing
Material	External cylinder	Martensitic stainless steel				Martensitic stainless steel
	Balls					Silicon nitride
	Retainer	Austenitic stainless steel				Austenitic stainless steel
	Shields	Precipitation hardened stainless steel				Precipitation hardened stainless steel
Lubricant		EXSEV®-EX (Grease) [2)]	New Clean Pro Bearing-PR coating over the entire surface of all components	Silver ion plated balls	Molybdenum disulfide coated on the retainer surface	(Remark)

Notes 1) Hybrid Ceramic Linear Motion Ball Bearings with grease lubrication or with New Clean Pro Bearing-PR are also available. Consult JTEKT regarding the applications of these bearings.
2) For details on EXSEV®-EX (grease), refer to page 94.

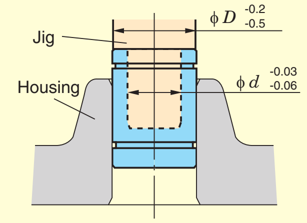
Notes 1) This catalogue does not contain the dimensions tables of mm-series linear motion ball bearings (for Europe). Contact JTEKT for the dimensions.
2) The clearance adjustment type (AJ) and open type (OP) are not compatible with tandem type and flanged type.

Bearing Mounting

1) Linear motion ball bearings are constructed not to allow rotary motion but allow linear motion only.
These bearings should carry loads evenly throughout their entire stroke; therefore, when the bearing is subjected to bending loads, mount two bearings at a distance on a shaft, or use a tandem type linear motion ball bearing.
2) When installing a linear motion ball bearings in a housing, press one end face of the external cylinder into the housing, taking care not to push or hit the shield, or insert the bearing softly using a jig as shown in the figure at right. When inserting a shaft, check the shaft for burrs or indentations in advance and insert it slowly so as not to deform the shaft. Chamfer the shaft end faces.
3) To support linear motion ball bearings built in a single housing on a set of two or more shafts, adjust the parallelism of the shafts while checking the smooth motion of the bearings. Imperfectly paralleled shafts may disturb smooth motion of the bearings or shorten their service life.

Jig for bearing installation in housing



Typical use on two shafts

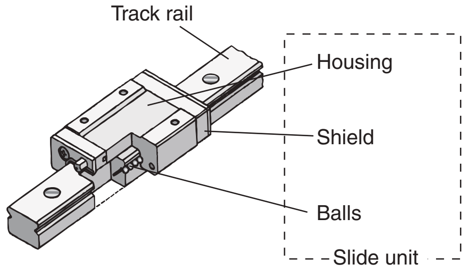
5-2 Linear Way Bearing Units for Use in Extreme Special Environments

The Linear Way Bearing Units have a slide unit in which balls circulate, allowing the slide unit to move linearly on the track rail without limit. High precision linear motion can be obtained easily by fixing the slide unit and track rail with bolts.



Bearing Types

		EXSEV®-EX (Linear Way Bearing Unit)	New Clean Pro Bearing-PR (Linear Way Bearing Unit)	Hybrid Ceramic Linear Way Bearing Unit [1]
Material	Housing	Martensitic stainless steel		Martensitic stainless steel
	Track rail			
	Balls			Silicon nitride
	Shields	Austenitic stainless steel		Austenitic stainless steel
Lubricant		EXSEV®-EX (Grease) [2]	New Clean Pro Bearing-PR coating over the entire surface of all components	(Remark)

Notes 1) Hybrid Ceramic Linear Way Bearing Unit with grease lubrication or with New Clean Pro Bearing-PR are also available.
Consult JTEKT regarding the use of these bearings.
2) For details on EXSEV®-EX (grease), refer to page 94.

Applicable Environments

Note 1) The variation refers to the dimensional difference between the slide units built into the same track rail.

Remark) The preload is null or negligible.

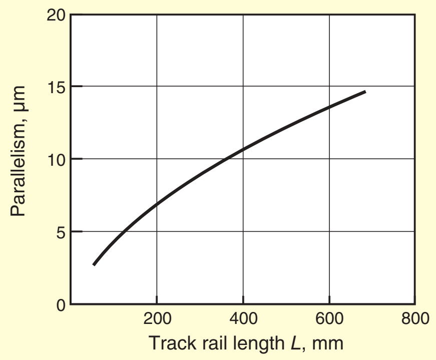

Fig. 5-1 Running parallelism of Linear Way Bearing Unit (Type 1)

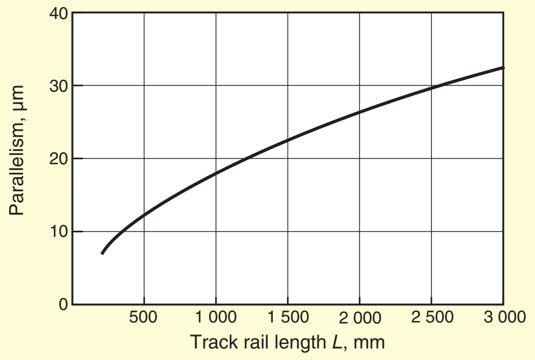

Fig. 5-2 Running parallelism of Linear Way Bearing Unit (Type 2)

Bearing Mounting

1) Do not change the factory assembled combination of the slide units and track rail.
Handle the linear way bearing units carefully to keep them out of oil stains and dust.

2) Before installing a linear way bearing unit in a machine or equipment, remove burrs and indentations from the contact surface of both the machine and bearing unit. Also remove dust, contamination and oil stains. Clean the recesses of the mounting surface (Fig. 5-3).

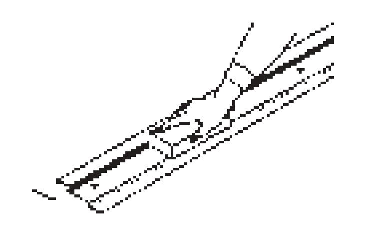

Fig. 5-3 Cleaning of the mounting surface

3) After positioning the mounting reference plane of the track rail correctly to the mounting reference plane of the bed, temporarily fasten the track to the bed (Fig. 5-4). Then bring the two planes into close contact, using a small vice or other suitable tool. Tighten the bolts one by one to securely fasten the drive side track rail to the bed (Fig. 5-5). The driven side track rail of the Linear Way Bearing Unit should be kept temporarily fastened.

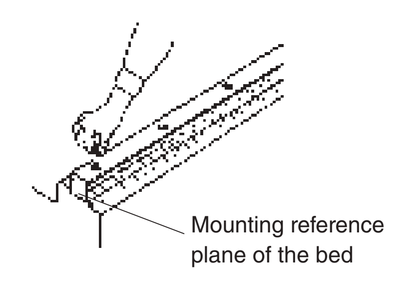

Fig. 5-4 Temporary fastening of the track rail

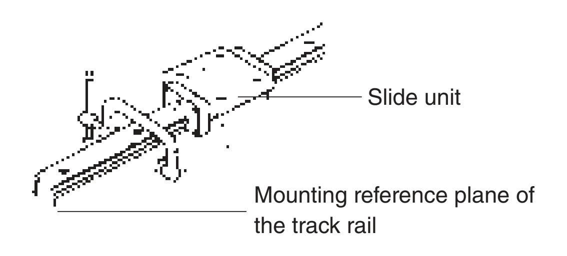

Fig. 5-5 Fastening of the drive side track rail

4) After positioning the slide units of the linear way bearing unit to the table, place the table carefully on the slide units and then temporarily fasten them together. Then align the mounting reference plane of the drive side slide units correctly with that of the table and fasten them together. With one of the driven side slide units positioned and fixed with respect to the moving direction, leave the other slide unit loosely tightened (Fig. 5-6).

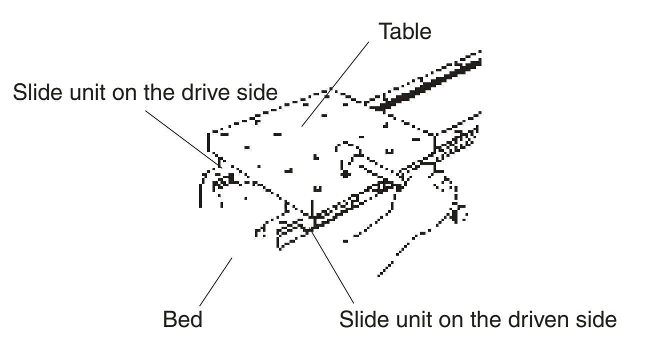

Fig. 5-6 Fastening of the slide unit

5) Before securely fastening the temporarily fastened track rail on the driven side, move the table and check that the motion is smooth. Tighten the fastening bolt that has just been passed over by the slide unit, thus fastening the track rail to the bed in a step-by-step manner (Fig. 5-7).
Securely fasten the slide unit to the table, which has been kept temporarily fastened.

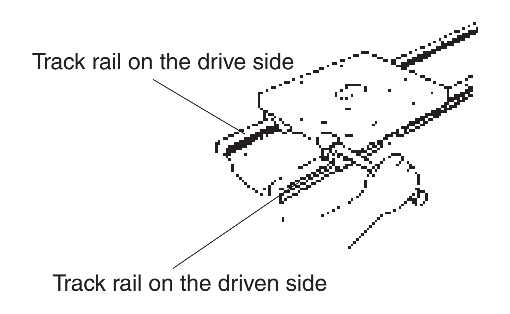

Fig. 5-7 Fastening of the driven side track rail

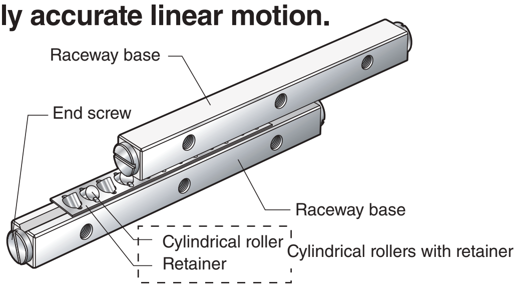
5-3 Cross Roller Way Bearing Units for Use in Extreme Special Environments

The Cross Roller Way Bearing Unit is a linear motion bearing unit consisting of two raceway bases. Each base has one longitudinal plane cut into a V shape, which serves as the rolling surface. Two bases are in contact on each of the other's V-cut surface, and cylindrical rollers with a retainer are placed between the surfaces. Any pair of adjacent cylindrical rollers is directed at right angles to each other, thus enabling smooth and extremely accurate linear motion.



Bearing Types

		EXSEV®-EX (Cross Roller Way Bearing Unit)	New Clean Pro Bearing-PR (Cross Roller Way Bearing Unit)	EXSEV®-MO (Cross Roller Way Bearing Unit)
Material	Raceway base	Martensitic stainless steel		
	Cylindrical rollers			
	Retainer	Austenitic stainless steel		
	End screw			
Lubricant		EXSEV®-EX (Grease) [1]	New Clean Pro Bearing-PR coating over the entire surface of all components	Molybdenum disulfide coating on the raceway bases

Note 1) For details on EXSEV®-EX (grease), refer to page 94.

Applicable Environments

	EXSEV®-EX (Cross Roller Way Bearing Unit)	New Clean Pro Bearing-PR (Cross Roller Way Bearing Unit)	EXSEV®-MO (Cross Roller Way Bearing Unit)
Cleanliness	Class 100	Class 10	–
Temperature ˚C	– 50 to 260	– 100 to 200	– 100 to 300
Ambient pressure Pa (Room temperature)	Atmospheric air to 10^{-7}	Atmospheric air to 10^{-5}	Atmospheric air to 10^{-5}

Bearing Numbering System

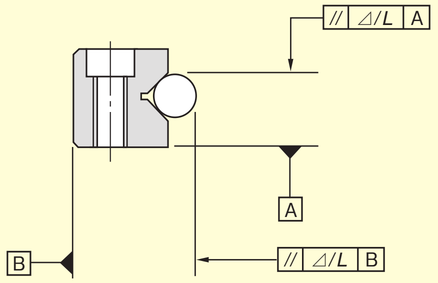
Standard	: No code
Ultrahigh accuracy	: SP

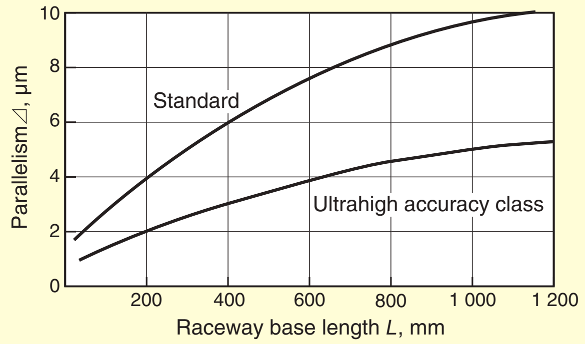
Material code

Stainless steel	: SL

Note) This bearing number represents four raceway bases and two sets cylindrical rollers with retainer.

Tolerance (before surface treatment)





Bearing Mounting

Fig. 5-8 shows a typical mounting construction of the Cross Roller Way Bearing Unit. Mounting procedures are described on the following page.

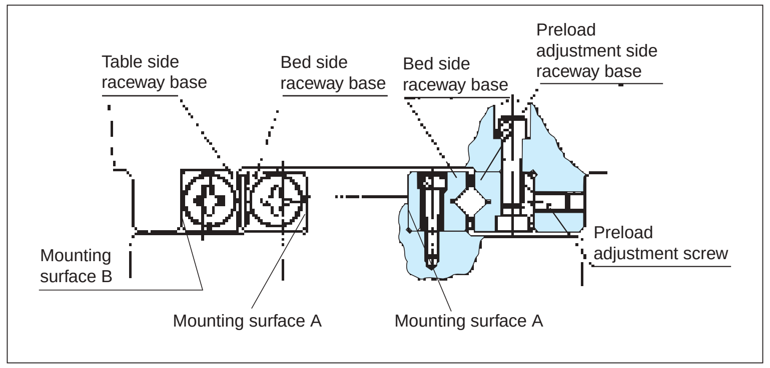


Fig. 5-8 Typical mounting of Cross Roller Way Bearing Unit

1) One package includes an entire set of the components of a cross roller way bearing unit (four raceway bases and two sets of cylindrical rollers with retainer). Take care not to mix the components of a set not compatible with those of another set. Treat cross roller way bearing units with extra care to keep them free from oil stains or contamination.

2) Remove burrs, indentations and other irregularities from the machine surface on which the cross roller way bearing unit is to be mounted. Also clean off dust, contamination and oil stains. Clean the recesses of the mounting surface as well.

3) Place the bed side raceway base and table side raceway base correctly on the each mounting surface, and fasten the bases temporarily by tightening the screws evenly.
While keeping the bed side raceway base in close contact with surface A and the table side raceway base with surface B, tighten the screws permanently to a specified torque (Fig. 5-9).
Table 5-1 shows the tightening torque for individual regular screw sizes.

Table 5-1 Screw tightening torque

Nominal screw size	Tightening torque N · m
M2×0.4	0.23
M3×0.5	1.4
M4×0.7	3.2
M5×0.8	6.3
M6×1	10.7

Remark) When screws of different sizes are used for on the table side and bed side, tighten them by applying the torque for the smaller screws.

4) Retract the preload adjustment screw in advance. Place the preload adjustment side raceway base into close contact with the mounting surface, and tighten the screws temporarily by applying light, even torque.

5) To assemble the table and bed, insert cylindrical rollers with retainer carefully into the space between the table side raceway base and bed side raceway base such that the rollers will be located at the center of the raceway base length. Take care not to deform the cage.
Fasten the end screws and end plates of the raceway bases, press the entire table toward the preload adjustment screw side, and tighten the screw for temporary adjustment until the clearance of the raceways is almost entirely eliminated.
Slowly move the table for one entire stroke and adjust the position of the cylindrical rollers with retainer to the center.

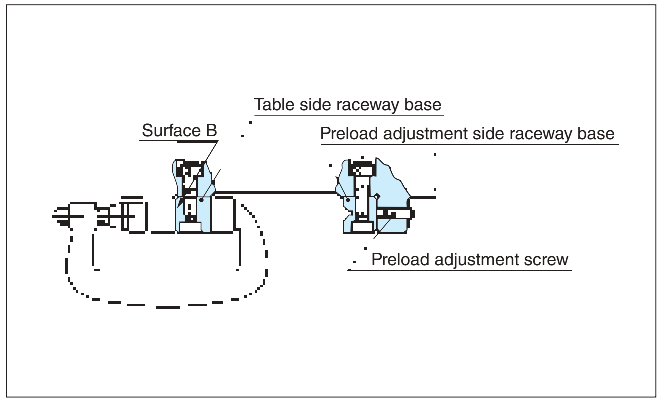

Fig. 5-9 Mounting of table side raceway base

6) Adjust the preload with the preload adjustment side raceway base fastened temporarily.
Firstly adjust the preload adjustment screw at the center of the raceway base length, and adjust the preload adjustment screws on the lengths to both ends alternately. Adjust the clearance on the side face of the table, and tighten the preload adjustment screws one by one until the dial gauge indication becomes stable (Fig. 5-10).
When the indication is stable, determine and record the tightening torque of the preload adjustment screws. To adjust the preload adjustment screws near both ends, stroke the table slowly to check that cylindrical rollers are located at the preload adjustment screw.
After these adjustments, the clearance will be entirely or almost eliminated. However, at this point the preload is not yet even. By repeating the same procedure, re-adjust all the preload adjustment screws by applying the torque recorded.

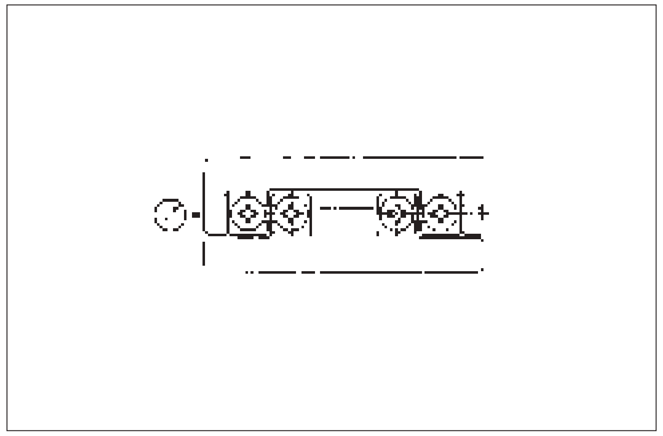

Fig. 5-10 Typical preload adjustment procedure

7) When permanently fastening the preload adjustment side raceway base, make sure the screws have already been lightly tightened to even torque.
In the same manner as the preload adjustment screws were tightened, firstly adjust the preload adjustment screw at the center of the raceway base length, and adjust the preload adjustment screws on the lengths to both ends alternately by applying torque close to the specified torque.
To tighten the fastening screws near the ends, stroke the table slowly to check that the cylindrical rollers are located at the tightened screw position.
In the end, tighten all screws evenly and permanently by applying specified torque. Move the table slowly through the entire stroke and check that it moves smoothly without producing noise.
Check the table upper surface and side faces with a dial gauge to check running accuracy.

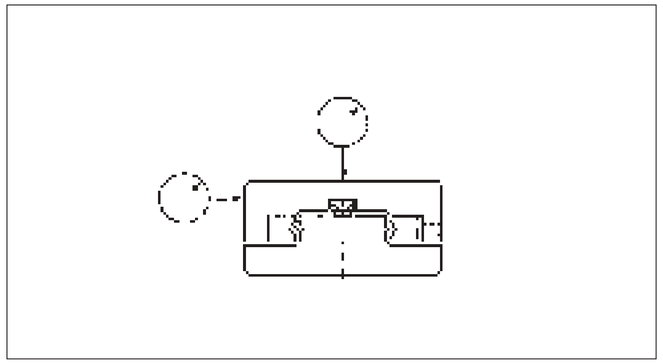

Fig. 5-11 Accuracy check after assembly

6 High Ability Angular Contact Ball Bearings

The High Ability Angular Contact Ball Bearings are optimized for the spindle of machine tools. They have superior high speed performance and rapid acceleration/deceleration, and are especially excellent at ultrahigh speeds under oil/air lubrication. They are superior in high speed performance to conventional products under grease lubrication as well.

For practical use of this type of bearings, refer to JTEKT Catalogue "Precision Ball and Roller Bearings for Machine Tools" for High Ability Angular Contact Ball Bearings.

Types and Applications

The High Ability Angular Contact Ball Bearings are classified as shown in Table 6-1, according to bearing construction and rolling element material.

Select the optimal type best suited for your application needs.

Table 6-1 Classification of High Ability Angular Contact Ball Bearings

Type	Specifications			Application
	Bearing dimension series No.	Contact angle	Rolling element material	
Type R 	10 19	15° 20° 30°	Steel or ceramic	High speed, high rigidity type
Type C 	10 19	15° 20°	Ceramic	High speed, high load rating type
Type D 	10	20°	Ceramic	Ultrahigh speed, low noise type For oil/air lubrication
Type X 	10 19	20°	Ceramic	Ultrahigh speed type For oil/air lubrication

Features

- **20 to 30% reduction in temperature increase**

(compared with JTEKT's conventional products)

JTEKT has conducted various tests and analyses and developed elaborate machining techniques to improve the performance of bearings used with machining tool spindles. The result is a substantial reduction in frictional heat generated in bearings rotating at a high speed.

- **1.2- to 1.5- fold increases in speed limits**

(compared with JTEKT's conventional products)

Speed limits have been extended through re-designing for high-speed rotation and heat reduction. Use of ceramic balls as rolling elements enables additional high-speed rotation.

- **Improved high speed performance achieved by position preloading**

Low increases in temperature during operation ensure reduced changes in preload. Preload can be given by position preloading even at high speeds, which has been hitherto unavailable with conventional systems. The result is high-precision machining with stability.

- **Conventional bearings easily replaced**

Dimensions of High Ability bearings conform to ISO standards. Replacement of conventional bearings with High Ability bearings requires minimal geometry changes of the present spindle or housing.

High Ability Angular Contact Ball Bearing Series

Hybrid Ceramic Bearing

Performance

High Ability Bearings demonstrate their utmost performance when two or more units are used together and a preload is provided by the position preloading method. The following are the performance of these bearings preloaded by the position preloading method.

- **High speed performance of Type R and Type C High Ability Bearings**

Fig. 6-1 shows the relationship between rotational speed and bearing temperature rises of High Ability Bearings, in comparison with conventional high precision bearings.

In either grease lubrication or oil/air lubrication, the High Ability Bearings are superior to conventional bearings, with lower temperature rise and higher rotational speed limit.

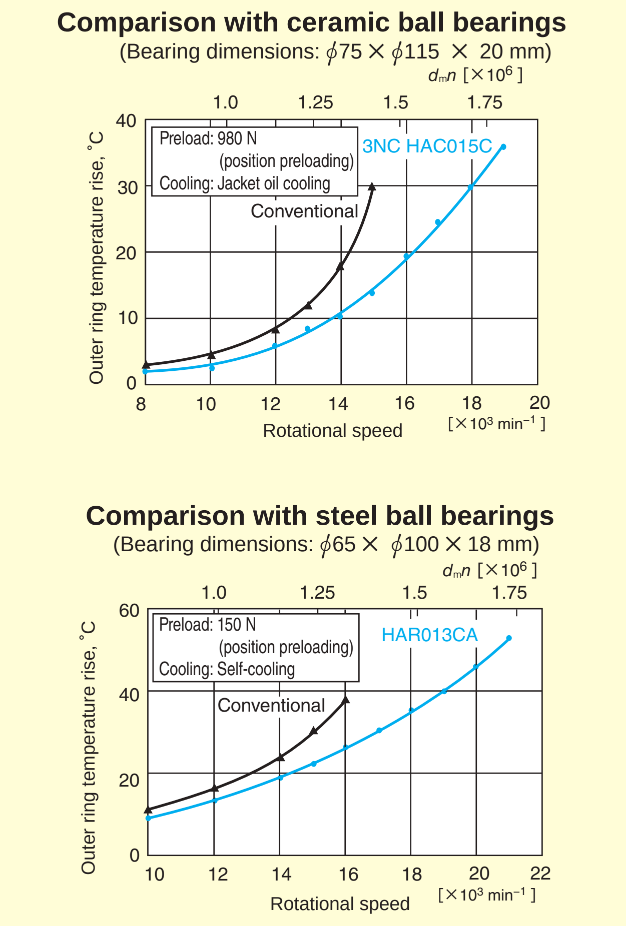

Fig. 6-1 Comparison in bearing temperature rises under oil air lubrication

By using High Ability Bearings, it is possible to switch the spindle, which had been running with oil/air lubrication up until now, to grease lubrication.

Fig. 6-2 shows evaluation examples of this.

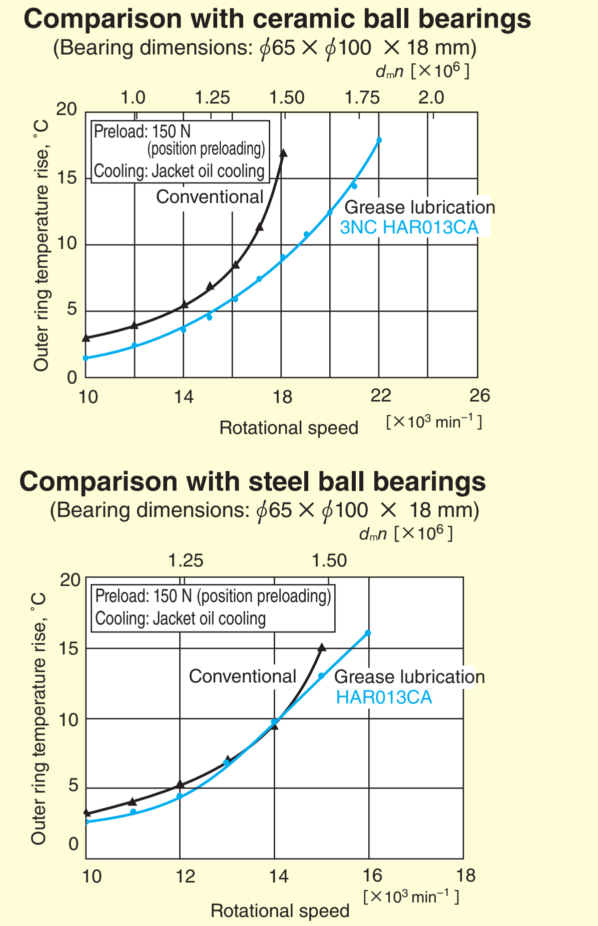

Fig. 6-2 Comparison in high speed performance under grease lubrication

The Type R using ceramic balls, in grease lubrication, improves on high-speed performance over conventional bearings with oil/air lubrication.

The high-speed performance of the Type R using steel balls, in grease lubrication, is the same as or better than that of conventional bearings with oil/air lubrication.

Fig. 6-3 shows the result of the comparison between ceramic balls and bearing steel balls.

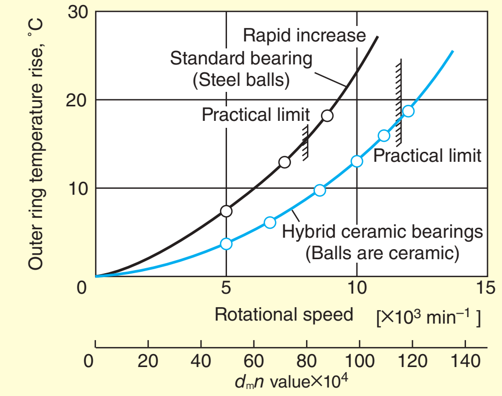

Fig. 6-3 Comparison of temperature rise characteristics between hybrid ceramic bearings and standard bearings

7 Ceramic Balls

JTEKT also supplies Ceramic Balls (silicon nitride), which have excellent resistance to wear and seizure, and are usable in corrosive environments and ultrahigh vacuums. Other major features of these balls are excellent heat resistance (up to 800˚C), high rigidity, lightweight (40% compared to bearing steel), non-magnetic, and have insulating characteristics.

The Ceramic Balls are useful in many applications such as jigs, tools, gauges, solenoid valves, check valves, other valve varieties, high grade bicycle parts, automotive parts, and machine components.

Table of Dimensions and Masses

Nominal dimension mm	Nominal dimension inch	Nominal outside diameter mm	Precision grade [1]	Mass [2] (per piece)
0.8		0.800 00	3 and 5	0.866 mg
1.0		1.000 00		1.691 mg
1.2		1.200 00		2.922 mg
	1/16	1.587 50		6.766 mg

8 EXSEV®-EX (Grease)

This fluorinated grease is designed for vacuum environments with low particle generation. It is also compliant with environmental regulations (does not contain PFOA).

EXSEV®-EX offers superior performance for rolling bearings, linear motion bearings, and ball screws. JTEKT also handles requests for grease only. Contact us for more information.

	Grease No.
75 g tube	SVEX0.075KG //P0/98
750 g cartridge	SVEX0.75KG //P0/98
1 kg can	SVEX1KG //P0/98

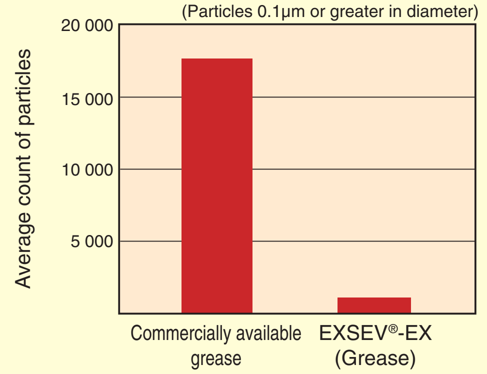
Properties

Thickener	PTFE
Base oil	PFPE
Dropping point	None
Evaporation (99˚C×24h)	0.1wt%max.
Oil separation (100˚C×24h)	2wt%max.
Operating temperature range	–50 to 260˚C

- The grease can be used under atmospheric pressures of up to 10^{-7} Pa at 20°C, but consult JTEKT for use in high-temperature, high-vacuum combinations.

Performance

Particle emission characteristics when used as ball and roller bearing lubrication
(Particles per 2.83 × 10^{-3} m³ (0.1 ft³))



9 Grease-filled Bearings for Food Machinery

These are bearings that are filled with grease for food machinery.

They can be used in hygienic environments such as food machinery or cosmetic/pharmaceutical production machinery.

Grease Properties

	Standard	Long service life
Operating temperature range	-30 to 120°C	-40 to 150°C
Thickener	Aluminum complex soap	Silicate
Base oil	Synthetic oil	Synthetic oil
Kinematic viscosity (mm²/s, at 40°C)	150	65
Worked penetration	275	280
NSF category*	H1	H1

* NSF category:
This is a standard certified by NSF International (National Sanitation Foundation International).
"H1" indicates a lubricant that can be used in locations that may accidentally come into contact with food.

Bearing Specifications

Type	Inner and outer rings, balls	Packing specifications
A	Martensitic stainless steel	Anticorrosive oil applied + standard packing
B	Martensitic stainless steel	Degreasing + clean packing
C	High carbon chromium bearing steel	Anticorrosive oil applied + standard packing

Bearing Numbering System

In addition to the same bearing number of the general bearing having the same size, specify that the bearing is filled with grease (standard or long service life grease) for food machinery. The basic bearing specifications are type A, but types B and C can also be supported according to customer request.

S_{ia}, S_{ea}: axial runout of assembled bearing inner or outer ring, max.

[Notes] Category Ⅰ specifications are applied to deep groove ball bearings.
Category Ⅱ specifications are applied to angular contact bearings and four point contact ball bearings.

3 Application Examples

1 Clean Environments

1-1 Transfer Robot

Product: K Series Full Complement Hybrid Ceramic Ball Bearing

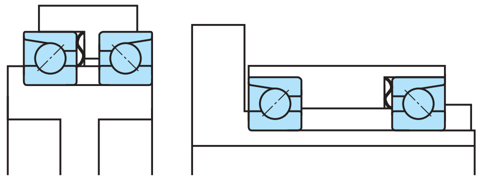
For application in transfer robots for semiconductor and liquid crystal manufacturing equipment, bearings are required to be low in particle emissions and have a long service life.

Bearings may be delivered incorporated in arm units for improved assemblability and maintainability.

- Applicable to vacuum environments and clean environments
- Optimal for machine size reduction

Use conditions

Temperature: Room temp. to 200˚C
Ambient pressure: 10^{-3} Pa
Lubrication: Grease or
New Clean Pro Bearing-PR coating



Bearing unit for application to transfer robots

1-2 Conveyor for Sputtering Equipment

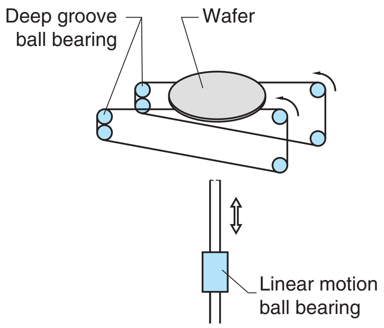
Product: New Clean Pro Bearing-PR (Linear Motion Ball Bearings)

New Clean Pro Bearing-PR Linear Motion Ball Bearings are widely used for the conveyers in sputtering equipment.

- Applicable to vacuum environments and clean environments

Use conditions

Stroke: 20 mm
Speed: 10 mm/s
Temperature: 200˚C
Ambient pressure: Atomospheric air to 10^{-5} Pa
Lubrication: New Clean Pro Bearing-PR coating



1-3 Gates in Chemical Vapor Deposition Equipment

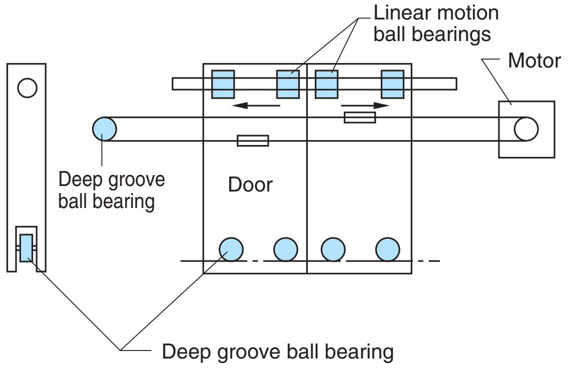
Product: Hybrid Ceramic Ball Bearing New Clean Pro Bearing-PR (Linear Motion Ball Bearings)

Hybrid Ceramic Bearings and New Clean Pro Bearing-PR Linear Motion Ball Bearings are widely used for the doors of the chemical vapor deposition (CVD) equipment.

- Applicable to high temperature, vacuum and clean environments

Use conditions

Rotational speed: 10 to 200 min^{-1}
Temperature: 200˚C
Ambient pressure: Atomospheric air to 10^{-4} Pa
Lubrication: New Clean Pro Bearing-PR coating



1-4 Chemical Vapor Deposition Machine

Product: New Clean Pro Bearing-PR (Cross Roller Way Bearing Unit)

New Clean Pro Bearing-PR Cross Roller Way Bearings are widely used in CVD machines due to their low gas and particle emissions.

- Applicable to vacuum environments and clean environments

Use conditions

Stroke: 100 mm
Temperature: 200˚C
Ambient pressure: Atomospheric air to 10^{-3} Pa
Lubrication: New Clean Pro Bearing-PR coating

1-5 Etching Equipment

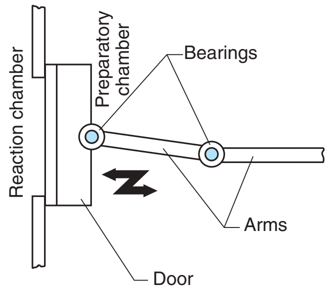
Product: Hybrid Ceramic Bearing (with special features)

Bearings used in etching machines must be resistant to halogen, hydrogen fluoride, and other corrosive gasses, as well as low in particle emissions. To meet these requirements, PTFE coated Hybrid Ceramic Bearings are used.

- Resistant to corrosive ambient gases such as halogen and hydrogen fluoride
- Suitable for clean environments thanks to low particle emissions

Use conditions

Temperature: Room temp. to 60˚C
Ambient pressure: Atomospheric air to 10^{-2} Pa
Load: Radial load of 10 N
Lubrication: PTFE coating



1-6 Sputtering Equipment

Product: Clean Pro Bearing-RB

Sputtering systems have a high temperature vacuum conveyor, in which Clean Pro Bearing-RB are used.

- Applicable to a clean environment under high temperature and vacuum conditions

Use conditions

Rotational speed: 60 min^{-1}
Temperature: Room temp. to 260˚C
Ambient pressure: 10^{-5} Pa
Load: Radial load of 100 to 150 N
Lubrication: Clean Pro Bearing-RB coating

1 Clean Environments

1-7 Liquid Crystal Panel Bonding and LC Sealing Furnace

Product: Hybrid Ceramic Linear Motion Ball Bearing

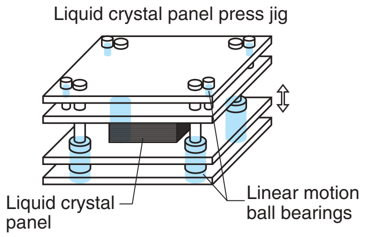
Substrate bonding press jigs for use in furnaces must be low in particle emissions and have a long service life under high temperature conditions.

The New Clean Pro Bearing-PR Hybrid Ceramic Linear Motion Ball Bearings are widely used for such jigs.

- **Suitable for clean environments thanks to low particle emissions**

Use conditions

Stroke speed: 5 mm/s
Temperature: 200˚C
Ambient pressure: Atomospheric air
Lubrication: New Clean Pro Bearing-PR coating



1-8 Wafer Transfer Equipment

Product: Hybrid Ceramic Linear Way Bearing Unit (with special features)

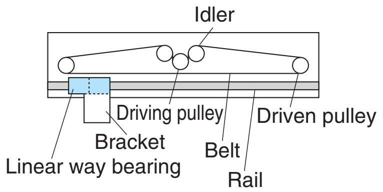
For application in wafer transfer equipment, low particle emissions performance is required.

The New Clean Pro Bearing-PR Hybrid Ceramic Linear Way Bearing Unit are widely used for such jigs.

- **Suitable for clean environments thanks to low particle emissions**
- **Corrosion resistant to cleaning agent splashes**

Use conditions

Stroke speed: 350 mm/s
Temperature: Room temp.
Ambient pressure: Atomospheric air
Lubrication: New Clean Pro Bearing-PR coating



2 Vacuum Environments

2-1 Vacuum Evaporator

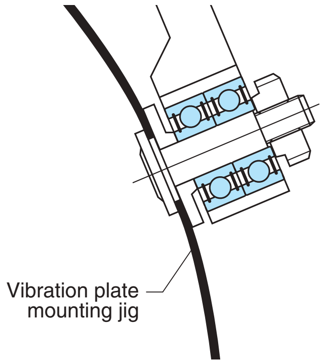
Product: High Temperature Hybrid Ceramic Bearing (with special features)

Bearings used in the planetary section of vacuum evaporator are required to be high in durability under high temperatures, high load (moment) conditions. To ensure a long bearing life under high temperature conditions, High temperature Hybrid Ceramic Bearings with special features are used.

- **Improved reliability in vacuum and high temperature environments**

Use conditions

Rotational speed: 1 to 30 min^{-1}
Temperature: 200 to 400˚C
Ambient pressure: 10^{-6} to 10^{-8} Pa
Lubrication: Molybdenum disulfide or silver



2-2 Turbo Molecular Pump

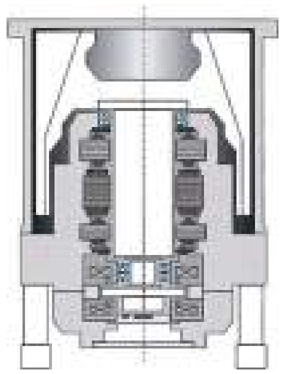
Product: Full Complement Hybrid Ceramic Ball Bearing (with special features)

Magnetic bearings are used in turbo molecular pumps driven at extremely high speeds. To protect the blades from fracture in case of a power failure or magnetic failure, touchdown bearing units are used. As touchdown bearings, Full Complement Hybrid Ceramic Ball Bearings are used to increase the service life of the touchdown bearings under severe hostile conditions.

- **Improved reliability in vacuum environments**

Use conditions

Rotational speed: 20 000 to 60 000 min^{-1}
Ambient pressure: 10^{-7} Pa
Lubrication: Molybdenum disulfide or silver



2-3 X-ray Tube

Product: Full Complement Ball Bearing Unit

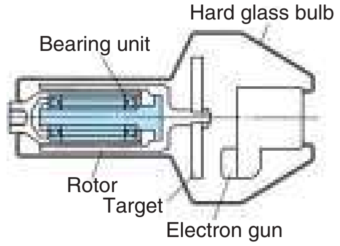
For rotational anode X-ray tubes, Full Complement Ball Bearing Units, which integrate the flange and shaft.

These bearing units are required to be resistant to vacuum, good high speed performance, heat resistant, and load capacity.

- **Improved reliability in vacuum and high temperature environments**

Use conditions

Rotational speed: 3 000 to 10 000 min^{-1}
Temperature: 250 to 500˚C
Ambient pressure: 10^{-6} Pa
Lubrication: Silver



3 Corrosive Environments

3-1 Synthetic Fiber Manufacturing Equipment

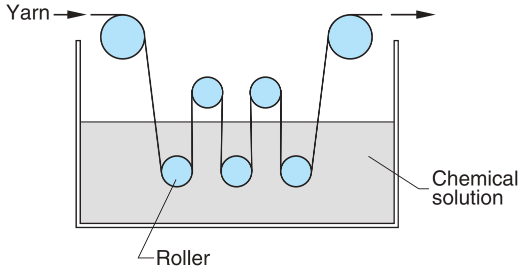
Product: Corrosion Guard Pro Bearing-MD

Acid solution, alkaline solution, water, and other liquids are used in synthetic fiber yarn reinforcing processes. In such corrosive environments, Corrosion Guard Pro Bearing-MD Bearings are widely used for their superior corrosion resistance.

- **Corrosion resistance under acid solution, alkaline solution and water**

Use conditions

Rotational speed: 20 to 100 min^{-1}
Temperature: Room temp. to 90˚C
Lubrication: Chemical solution



3-2 Blood product centrifuge

Product: Hybrid Ceramic Bearing (with special coating)

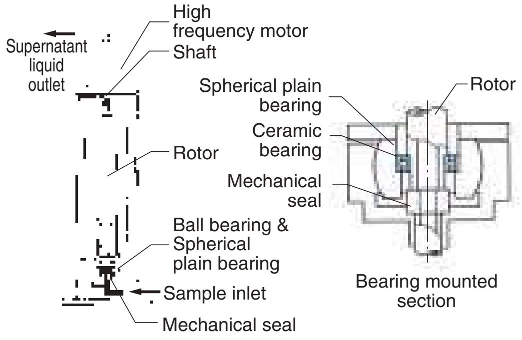
Corrosion resistance is required of bearings to be used in blood product centrifuge especially to physiological saline.

Hybrid Ceramic Bearings with bearing rings coated with a corrosion resistant film are suitable for such corrosive environments.

- **Corrosion resistance to physiological saline**

Use conditions

Rotational speed: 20 000 min^{-1}
Temperature: –10 to 10˚C
Lubrication: Grease



3-3 Aluminum Electrolytic Capacitor Manufacturing Equipment

Product: Corrosion Guard Pro Bearing-SC

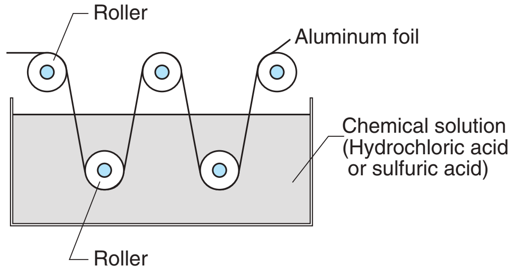
In an aluminum foil electrolytic capacitor manufacturing equipment, a strong acid solution is used to treat the aluminum foils.

In such highly corrosive environments, Corrosion Guard Pro Bearing-SC Bearings are widely used.

- **Corrosion resistance to strong acid solution**

Use conditions

Rotational speed: 50 min^{-1}
Temperature: 90˚C
Lubrication: Chemical solution
(hydrochloric acid and sulfuric acid)



3-4 High-performance Film Manufacturing

**Product: Corrosion Guard Pro Bearing-ZO
Corrosion Guard Pro Bearing-MD**

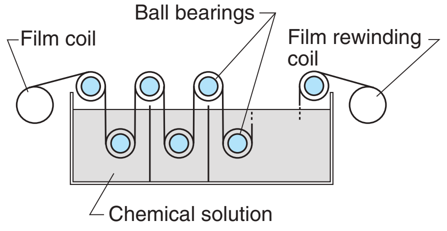
A variety of solutions—such as acid solutions, alkaline solutions, dyeing solutions, and distilled water—are used in the manufacturing lines of high-performance film.

In such corrosive environments, Corrosion Guard Pro Bearing-ZO and Corrosion Guard Pro Bearing-MD Bearings are widely used.

- **Corrosion resistance to solutions such as acid solution, alkaline solution, dyeing solution, and distilled water**

Use conditions

Rotational speed: 10 to 100 min^{-1}
Temperature: Room temp. to 80˚C
Lubrication: Chemical solution



3-5 Spin-dryer for Wafer Cleaning Equipment

Product: Corrosion Guard Pro Bearing-MD

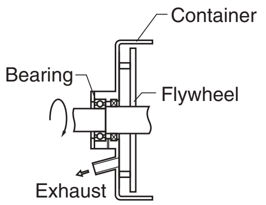
In semiconductor wafer cleaning processes, wafers are cleaned in cleansing chemicals, rinsing liquids, distilled water, and other liquids before drying.

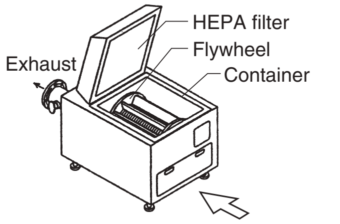
In such cleaning equipment, Corrosion Guard Pro Bearing-MD Bearings are widely used for their superior corrosion resistance.

- **Corrosion resistance to solutions such as cleaning chemicals, rinsing liquids, and distilled water**

Use conditions

Rotational speed: 2 000 to 3 000 min^{-1}
Temperature: Room temp.
Lubrication: Grease





3 Corrosive Environments

3-6 Chemical Mechanical Polishing System

Product: Corrosion Guard Pro Bearing-SC

In the semiconductor multilayer production process, each wafer surface should be treated to maintain evenness. This process uses chemical mechanical polishing equipment, and the cleaner attached to the equipment uses Corrosion Guard Pro Bearing-SC Bearings.

- **Corrosion resistance to corrosive solutions**

Use conditions

Rotational speed: 100 min^{-1}
Temperature: Room temp.
Lubrication: Cleaning agent

3-7 Outer Space Experimentation Equipment

Product: Ceramic Bearings

Utilized in experimental equipment on a space shuttle.

Stainless-steel bearings using fresh water as the lubricant experience abrasion and do not reach the required service life.

Using general ceramic bearings enables the required service life to be attained.

- **Long Service Life under Freshwater Lubricating Conditions**

Use conditions

Rotational speed: 10 000 min^{-1}
Temperature: 30˚C
Load: Radial 5 N, Axial 9 N
Lubrication: Fresh water

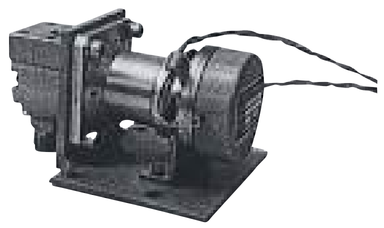


Photo: From the presentation materials for the 8th lecture on space stations

4 High Temperature Environments

4-1 Heating furnace

Product: High Temperature Hybrid Ceramic Bearing

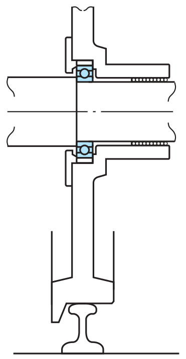
The bogies, conveyers and other carrier systems used in heating furnaces are exposed to high temperatures.

Because of their high heat resistance, High Temperature Hybrid Ceramic Bearings are used in such applications.

- **Applicable to high temperature environments**

Use conditions

Rotational speed: 10 to 500 min^{-1}
Temperature: 500˚C
Lubrication: Graphite



4-2 Carton Manufacturing Equipment

Product: EXSEV®-PN

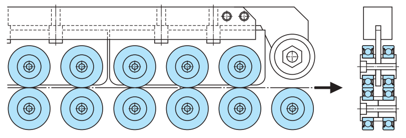
In carton manufacturing equipment, polyethylene film, which is attached to carton board in advance, is heat bonded by a gas burner in the high temperature gas burner bonding process.

The EXSEV®-PN which have superior heat resistance, are used to support the guide rollers of the belt that carries carton board in this process, thus avoiding contaminating the carton board with grease.

- **Prevention of grease scattering**
- **Improved durability and reliability under high temperatures**

Use conditions

Rotational speed: 3 000 to 4 000 min^{-1}
Temperature: 220˚C
Lubrication: Molybdenum disulfide and other means



4-3 Baking Furnace

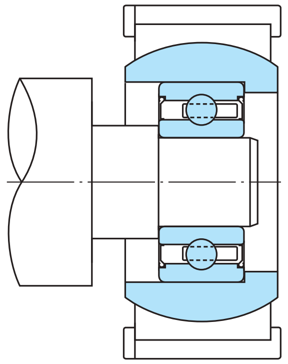
Product: High Temperature Hybrid Ceramic Bearing

In the kiln that bakes fluorine resin onto the heat rollers of copying machines, conveyor bearings must be low in particle emissions under high temperatures. Because it is structurally difficult to mount bearings accurately, High temperature Hybrid Ceramic Bearings are used for this application, along with aligning rings.

- **Compatible with high temperature environments**

Use conditions

Rotational speed: 3 to 10 min^{-1}
Temperature: 400 to 500˚C
Lubrication: Graphite



4 High Temperature Environments

4-4 Tube Annealing Furnace Guide Rolls

Product: Hybrid Ceramic Bearing

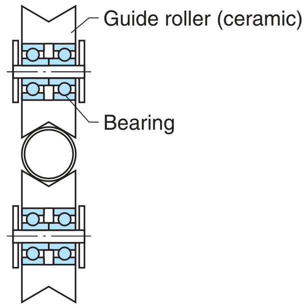
The guide roll bearings installed inside tube annealing furnaces are used under high temperatures without lubrication.

Hybrid Ceramic Bearings are suitable for such applications.

- Compatible with high temperature environments

Use conditions

Rotational speed: 300 min^{-1}
Temperature: 300°C



4-5 Diffusion Furnace Dolly

Product: Full-complement Ceramic Ball Bearings

Conditions in a diffusion furnace are harsh, including not only high temperature, but also corrosive gas.

Incorporating a rolling mechanism for the conveyor dolly in the furnace enables smooth conveyance to be obtained, thereby leading to improvements in product quality and productivity.

- Compatible with high-temperature environments
- Corrosion-resistant against corrosive gases
- Contributes to improved productivity

Use conditions

Temperature: 800°C or higher
Ambient pressure: Corrosive gas atmosphere
Load: 5 N

4-6 Blister Packaging Equipment

Product: High-temperature Hybrid Ceramic Bearings

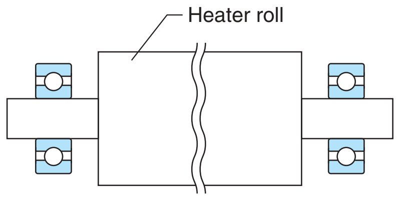
As heater roll bearings used in processing reach high temperatures during operation, conventional bearings are quickly damaged.

Incorporating high-temperature ceramic bearings extends the bearing replacement cycle and improves productivity.

- Applicable to high-temperature environments
- Contributes to improved productivity

Use conditions

Temperature: 250°C
Load: 900 N
Lubrication: Grease



5 Magnetic Field Environments

5-1 Electron Beam Lithography

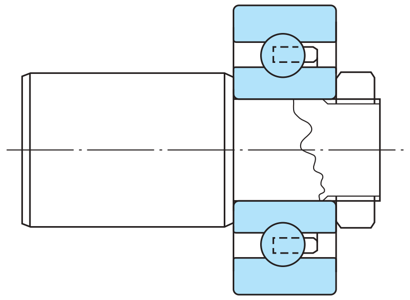
Product: Non-magnetic Hybrid Ceramic Bearing

The bearings in semiconductor production electron beam lithography are exposed to strong magnetic fields. Because of their non-magnetic characteristics, Hybrid Ceramic Bearings are used in such machines.

- Compatible with vacuum, strong magnetic field environments

Use conditions

Rotational speed: 100 min^{-1}
Temperature: Room temp.
Ambient pressure: 10^{-5} Pa
Lubrication: Grease



5-2 Magnetic Resonance Imagers

Product: Ceramic Bearing

The motors installed in magnetic resonance imagers (MRI) use magnetism insensitive Ceramic Bearings.

- Compatible with strong magnetic field environments

Use conditions

Rotational speed: 500 min^{-1}
Temperature: Room temp.
Lubrication: Grease

6 Electric Field Environments

6-1 Wind Turbine Generator

Product: Hybrid Ceramic Bearing

Wind Turbine Generator are strongly required to operate for extensive periods of time without the need of maintenance. However, bearings used in generators are subject to electrical pitting, which may cause the bearings to break down.

Hybrid Ceramic Bearings, which have superior durability and reliability, are widely used in such aerogenerators.

- Prevention of electrical pitting
- Extension of grease service life (three times longer than Koyo steel bearings)

Use conditions

Rotational speed: 2 700 min^{-1}
Temperature: Below freezing point to approx. 60˚C
Lubrication: Grease

6-2 DVD Sputtering Equipment

Product: Hybrid Ceramic Bearing

To improve reliability further, Hybrid Ceramic Bearings are used.

- Insulation

Use conditions

Rotational speed: 300 min^{-1}
Temperature: Room temp.
Lubrication: Grease

6-3 Fan Motor

Product: Hybrid Ceramic Bearing

Bearings used in motors are susceptible to electrical pitting. Hybrid Ceramic Bearings are widely used to prevent such pitting.

- Prevention of electrical pitting

Use conditions

Rotational speed: 5 000 min^{-1}
Temperature: –10 to 120˚C
Lubrication: Grease

6-4 Photographic Film Manufaturing Equipment

Product: Hybrid Ceramic Bearing (with special features)

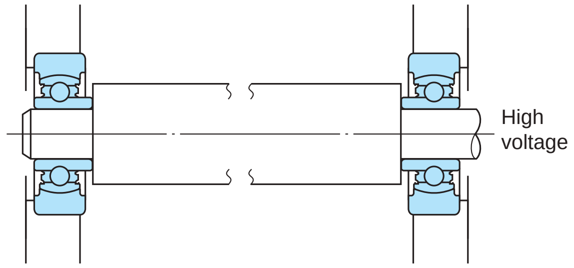
A photographic film production line treats film surfaces by applying a high voltage.

Hybrid Ceramic Bearings are widely used in such environments, because the ceramic inner ring and balls serve as insulators.

- Insulation under high voltage environments

Use conditions

Rotational speed: 200 min^{-1}
Temperature: Room temp.
Lubrication: Grease



6-5 Air-conditioner motors

Product : Hybrid Ceramic Bearings

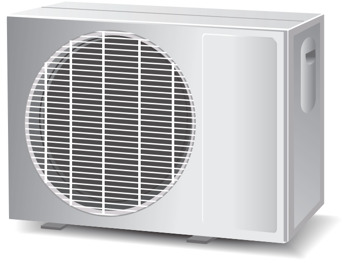
When using motors equipped with inverter control such as air-conditioner motors, there is a possibility of electric pitting defects occurring on motor bearings.

Using a ceramic — which is an insulator — as the rolling elements eliminates electric pitting.

- Electric pitting prevent through insulation performance

Use conditions

Rotational speed: 3 000 min^{-1}
Load (preload): 1.5% C
Lubrication: Grease



7 High Speed Applications

7-1 Turbocharger

Product: Hybrid Ceramic Bearing

Bearings that support the spindle of turbochargers should have good acceleration response characteristics and high durability under low viscosity, contaminated oil.

Because of their high reliability in these respects, Hybrid Ceramic Bearings are widely used for this application.

- **Three times longer service life than that of steel bearings**
- **Acceleration response up 20%**
- **An 80% reduction in oil supply**

Use conditions

Rotational speed: 180 000 to 210 000 min^{-1}
Temperature: 350°C
Lubrication: Oil

7-2 Spindle for Machine Tool (Angular Contact Ball Bearing)

Product: Hybrid Ceramic Bearing

Machine tool spindle bearings are required to have superior rotational performance at extremely high speeds, quick acceleration/ deceleration, high rigidity, and reduced temperature rises.

Hybrid Ceramic Bearings, which satisfy these requirements, are widely used in this application.

- **20% to 30% reduction in temperature rises**
- **The upper limit of the rotational speed range is 1.2 to 1.5 times higher (compared with Koyo steel bearings).**

Use conditions

Rotational speed: 25 000 min^{-1}
($d_m n = 2.75 \times 10^6$)
Spindle power: 75 kW
Lubrication: Oil or grease

7-3 Spindle for Machine Tool (Cylindrical Roller Bearing)

Product : Hybrid Ceramic Bearings

Seizure resistance performance under unbalanced load conditions due to misalignment improved at the Vertical Spindle Machining Center.

- **20% to 30% reduction in temperature rise**
- **Upper limit of rotational speed range is 1.2-1.5 times higher (compared to Koyo steel bearings)**

Use conditions

Rotational speed: 12 000 min^{-1}
Lubrication: Grease

7-4 Polygon Scanner Motor

Product: Hybrid Ceramic Bearing

Hybrid Ceramic Bearings, which exhibit superior high speed performance, are widely used in high speed polygon scanner motors.

- **Excellent reliability in high speed rotation**

Use conditions

Rotational speed: 26 000 min^{-1} or higher
Lubrication: Grease

7-5 Switched Reluctance Motor

Product: Hybrid Ceramic Bearing

For high speed, high efficiency switched reluctance (SR) motors, which do not use coils or permanent magnets, Hybrid Ceramic Bearings are applied.

- **Excellent reliability in high speed rotation**

Use conditions

Rotational speed: 30 000 min^{-1}
Lubrication: Grease

7-6 Steel Wire Stranding Machine

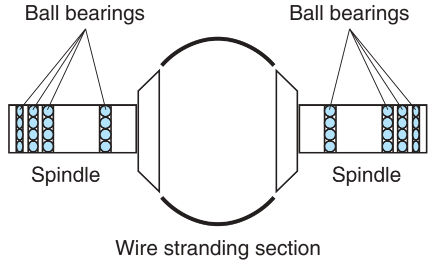
Product: Hybrid Ceramic Bearing

Steel wires for radial tires are produced by stranding steel wires to attain the required strength. In steel wire stranding machines, which involve high speed rotation, Hybrid Ceramic Bearings are used for improved service life and stability.

- **Reduced temperature rises**
- **Reliable durability**

Use conditions

Rotational speed: 6 000 min^{-1} or higher
Lubrication: Grease



7 High Speed Applications

7-7 Jet Electrostatic Coating Machine

Product: Hybrid Ceramic Bearing

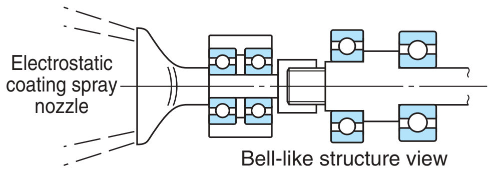
In a jet electrostatic coating machine, grease may escape from the spray nozzle due to the air motor, affecting the quality of the paint to be coated.

To resolve this problem, Hybrid Ceramic Bearings that do not use grease are used.

- **Prevention of grease scattering**
- **Prevention of paint contamination**

Use conditions

Rotational speed: 20 000 min^{-1}
Lubrication: Fluorine polymer



Bell-like structure view

7-8 Micro Gas Turbine Generator

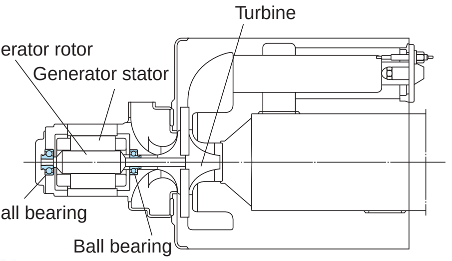
Product: Hybrid Ceramic Bearing

The world's smallest gas turbine generators emit clean exhaust emissions and hence are friendly to the environment. Hybrid Ceramic Bearings are used in these generators because they are low in vibration and noise generation, and have excellent high speed performance.

- **Improved reliability in high speed rotation**

Use conditions

Rotational speed: 100 000 min^{-1}
($d_m n = 2.22 \times 10^6$)
Temperature: 200˚C
Lubrication: Oil



7-9 Motorcycle Superchargers

Product: Hybrid Ceramic Bearings

The new superchargers for large motorcycles utilize lightweight, high-strength ceramic balls capable of high-speed rotation. The incorporation of ceramic balls has achieved bearings with excellent high-speed performance, heat resistance and abrasion resistance. Additionally, when using hybrid ceramic bearings, high output is achieved even for race-specification motors operating under harsh conditions.

- **High-speed performance, heat resistance and abrasion resistance improved**
- **Contributes to achieving high output supporting race specifications**

Photos: Courtesy of Kawasaki Heavy Industries, Ltd.

8 Abrasion Resistance

8-1 Fuel Injection System Control Valve

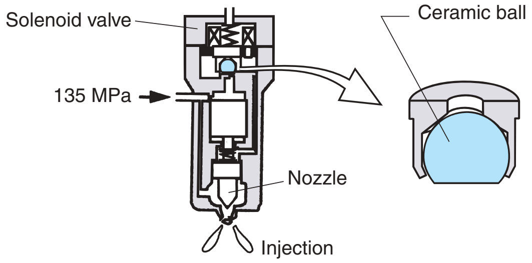
Product: Ceramic Ball

The common rail system (fuel injection system), which enables diesel engines to feature high power, good fuel economy and low emissions, is equipped with Ceramic Balls in the control valves.

- **Compatible with high pressure fuel injection thanks to improved wear resistance and seizure resistance**

Use conditions

Maximum pressure: 135 MPa



8-2 Rally Car Hub Units

Product: Hybrid Ceramic Bearings

Excellent abrasion resistance even under severe environmental conditions has improved durability and reliability.

- **Utilized in the car entered in the Paris-Dakar Rally in 1997 and 1998**
- **Rigidity improved**
- **Unsprung weight reduced**

Photos: Courtesy of Mitsubishi Motors Corporation

9 Low Torque

9-1 Inline Skates

Product: Hybrid Ceramic Bearing

Because of their low running torque and high durability, Hybrid Ceramic Bearings are widely used in speed skates.

- **Low torque and improved durability**

Use conditions

Rotational speed: 10 000 min^{-1}
Lubrication: Oil or grease

9-2 Wheel Bearings for Solar Cars

Product: Hybrid Ceramic Bearings

Stable operation of the motor section under severe open conditions of running eight hours or more per day. Improvements in weight reduction, durability and reliability.

Suppressing spinning resistance and efficiently transferring the driving force to the wheels contributes to saving power.

- **Australia: Covered over 3 000km vertically**
- **South Africa: Covered over 4 000km**

Use conditions

Rotational speed: 1 000 min^{-1}
Lubrication: Grease

Supplementary table 7 Cleanliness classes

JIS B9920/ISO14644-1 Upper limit to the concentration of individual cleanliness classes (particle count/m^3)
(Comparison with the U.S. federal standards)

	Cleanliness class								
FED 209D (particle count/ft^3)	—	—	class 1	class 10	class 100	class 1 000	class 1 000	class 100 000	—
JIS/ISO Particulate diameter (μm)	class 1	class 2	class 3	class 4	class 5	class 6	class 7	class 8	class 9
0.1	10	100	1 000	10 000	100 000	1 000 000	—	—	—
0.2	2	24	237	2 370	23 700	237 000	—	—	—
0.3	—	10	102	1 020	10 200	102 000	—	—	—
0.5	—	4	35	352	3 520	35 200	352 000	3 520 000	35 200 000
1.0	—	—	8	83	832	8 320	83 200	832 000	8 320 000
5.0	—	—	—	—	29	293	2 930	29 300	293 000
Particle diameter range	0.1 to 0.2	0.1 to 0.5	0.1 to 1.0		0.1 to 5.0		0.5 to 5.0		

Remarks
1) The U.S. Federal Standards are no longer in effect; however, in Japan and in the U.S., the old Federal Standard (FED-STD-209D) is commonly referred to.
2) The FED-STD-209D specifies that Class 100 limits the count of particles 0.5 μm or greater in diameter) to 100 (3 520 per cubic meter). This corresponds to Class 5 in the Japanese Industrial Standard and ISO Standard. (1 m^3 = 35.3 ft^3)

Koyo Extreme Special Environment Specification Sheet for EXSEV Bearings and/or Ceramic Bearings

Note: For the selection of the most suitable bearing, this sheet must be completed in as much detail as possible. Date

Bearing Dimensions	Bearing number		(If unknown) Bore dia.	× Outside dia.	× Width	(mm)
Application			Usage location :			
	○ For new design	○ For repair (replacement)	○ For repair (redesign)			
Special environment (required performance)	☐ Clean ☐ Vacuum ☐ Corrosion resistance ☐ High temperature	☐ Non-magnetism ☐ Insulation ☐ High speed	☐ Others ( )			
Operating condition	Operation	○ Dual-directional ○ Continuous ○ Intermittent		Running time	○ 24 h/day ○ h/day ○ Other ( )	
	Rotation speed	○ Inner ring rotating ○ Outer ring rotating				
		min.	(min⁻¹)		<Target service life> ○ Less than 1 year ○ 1 to 3 years ○ 3 to 5 years ○ More than 5 years	
		max.	(min⁻¹)			
		Normal	(min⁻¹)			
	Load	Radial	(N)	Fitting		Material | Tolerance | Surface roughness
		Axial	(N)		Shaft	
		Moment	(N)		Housing	
	Environment	Temperature (°C)	Normal min. max.	Humidity (%)		Cleanliness (Class)
		Pressure (Pa)	×10	○ Atmospheric ○ Atmospheric ⇔ Vacuum ○ Vacuum ○ Other ( )		
		Corrosive atmosphere	○ Present ○ Not present (If you selected "present" Gas :	Liquid :)		
		Usage of grease or oil	○ Possible ○ Not possible ○ Possible but not desirable			
	Other					
Quantity		/unit (line)	Required quantity from this order			
Present condition	Bearing material					
	Lubrication		Lubricant			
	Bearing replacement frequency					
	Failure mode(s)					
Cross sectional sketch of application and additional comments						

● With this sheet, the EXSEV and/or ceramic bearings most suitable for the operating conditions can be selected.

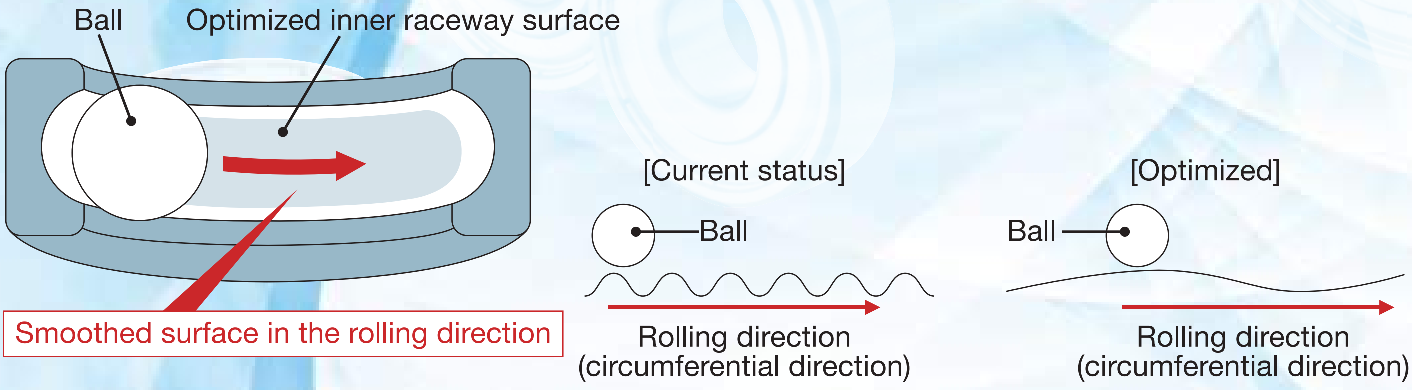
New Development /
New Product

Motor-use Deep Groove Ball Bearings with Optimized Sound Output

Sound from unpleasant frequencies to the human ear (1,000 Hz–5,000 Hz) is reduced.

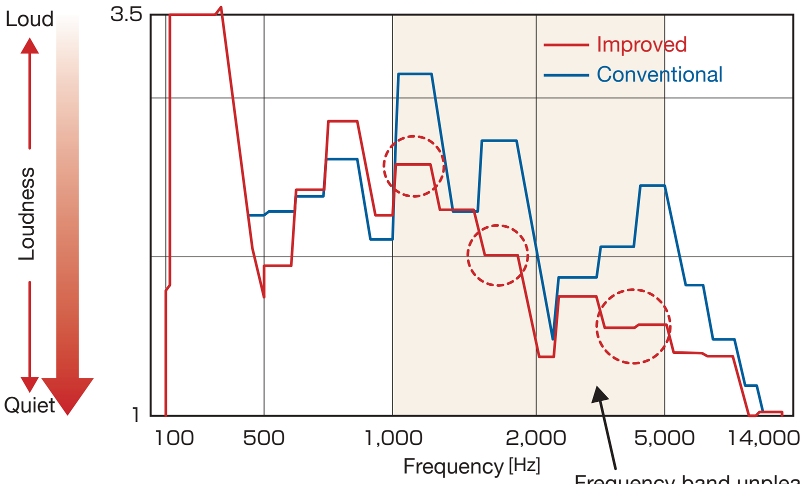
- **Inner raceway surface is optimized by 3D analysis technology.**



JTEKT | JTEKT CORPORATION

JTEKT
Koyo TOYODA

Measured example



Reduced loudness in the 1,000–5,000 Hz frequency band

Frequency band unpleasant to the human ear

EXSEV Bearing Series
Product Guidebook

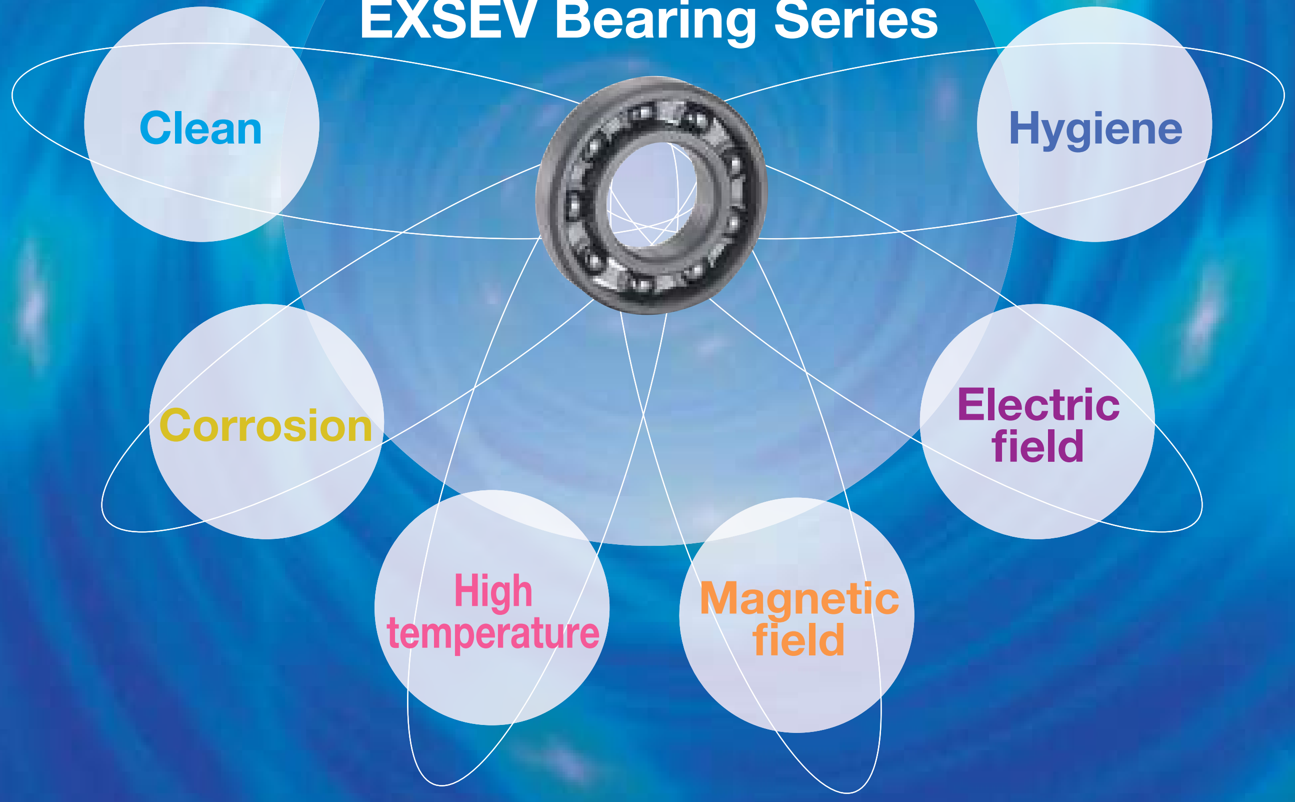
The Koyo EXSEV Bearing Series is a collection of high-performance bearings compatible with special operating environments and conditions, where conventional bearings are not applicable.

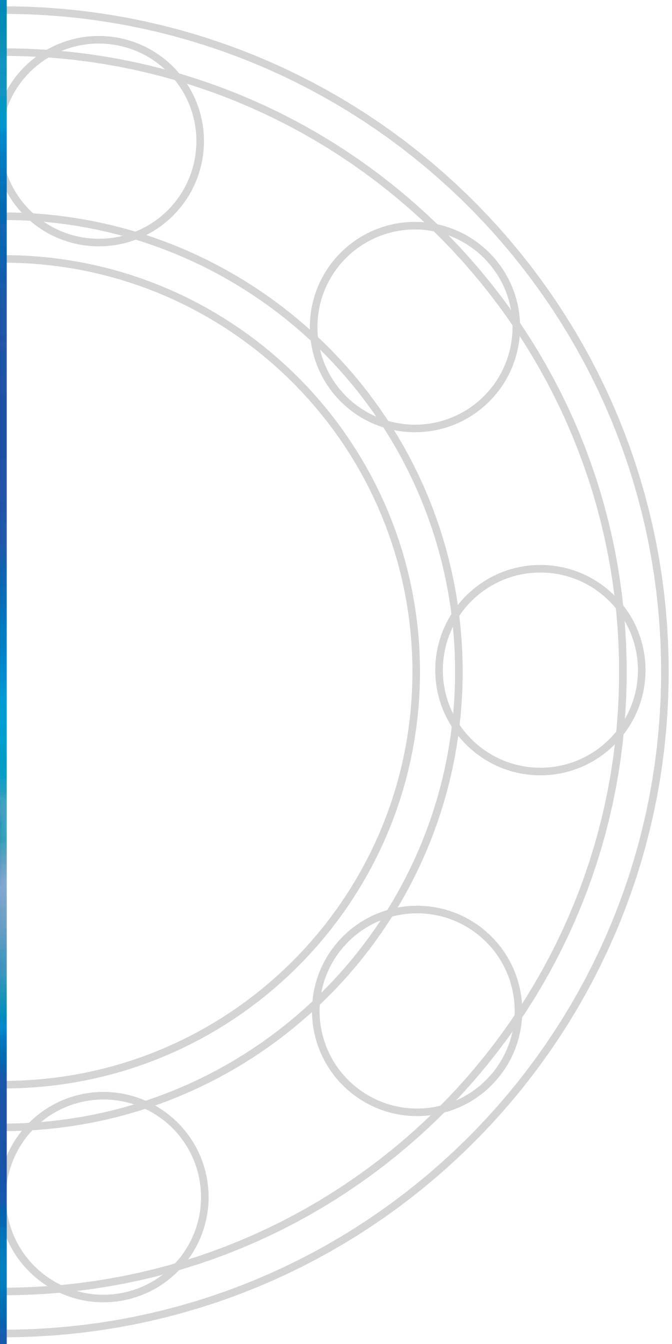
From among our varied collection of EXSEV Series bearings, this Guidebook includes products that are especially contributory to the semiconductor industry, such as in clean-room or vacuum-chamber applications.

Koyo is certain that the high-performance EXSEV Bearing Series, which is the materialization of new values, will assist the many engineers working not only in the semiconductor industry but in a variety of fields.

For your needs in varied extreme special environments

EXSEV Bearing Series





Contents

Clean environment

Corrosive environment

High temperature environment

Magnetic field environment

Electric field environment

Hygiene

EXSEV bearings in daily life and at the cutting edge of technology

Electric field Prevents damage from electric pitting to enable extended operation.

- Hybrid Ceramic Bearing

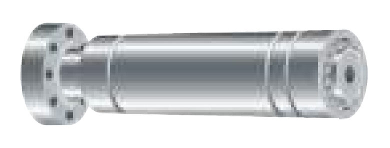
High temperature Compatible with the high temperature environments of the surface treatment used in the solar cell manufacturing process.

- WS Bearing
- PN Bearing
- Full Complement Ceramic Ball Bearing

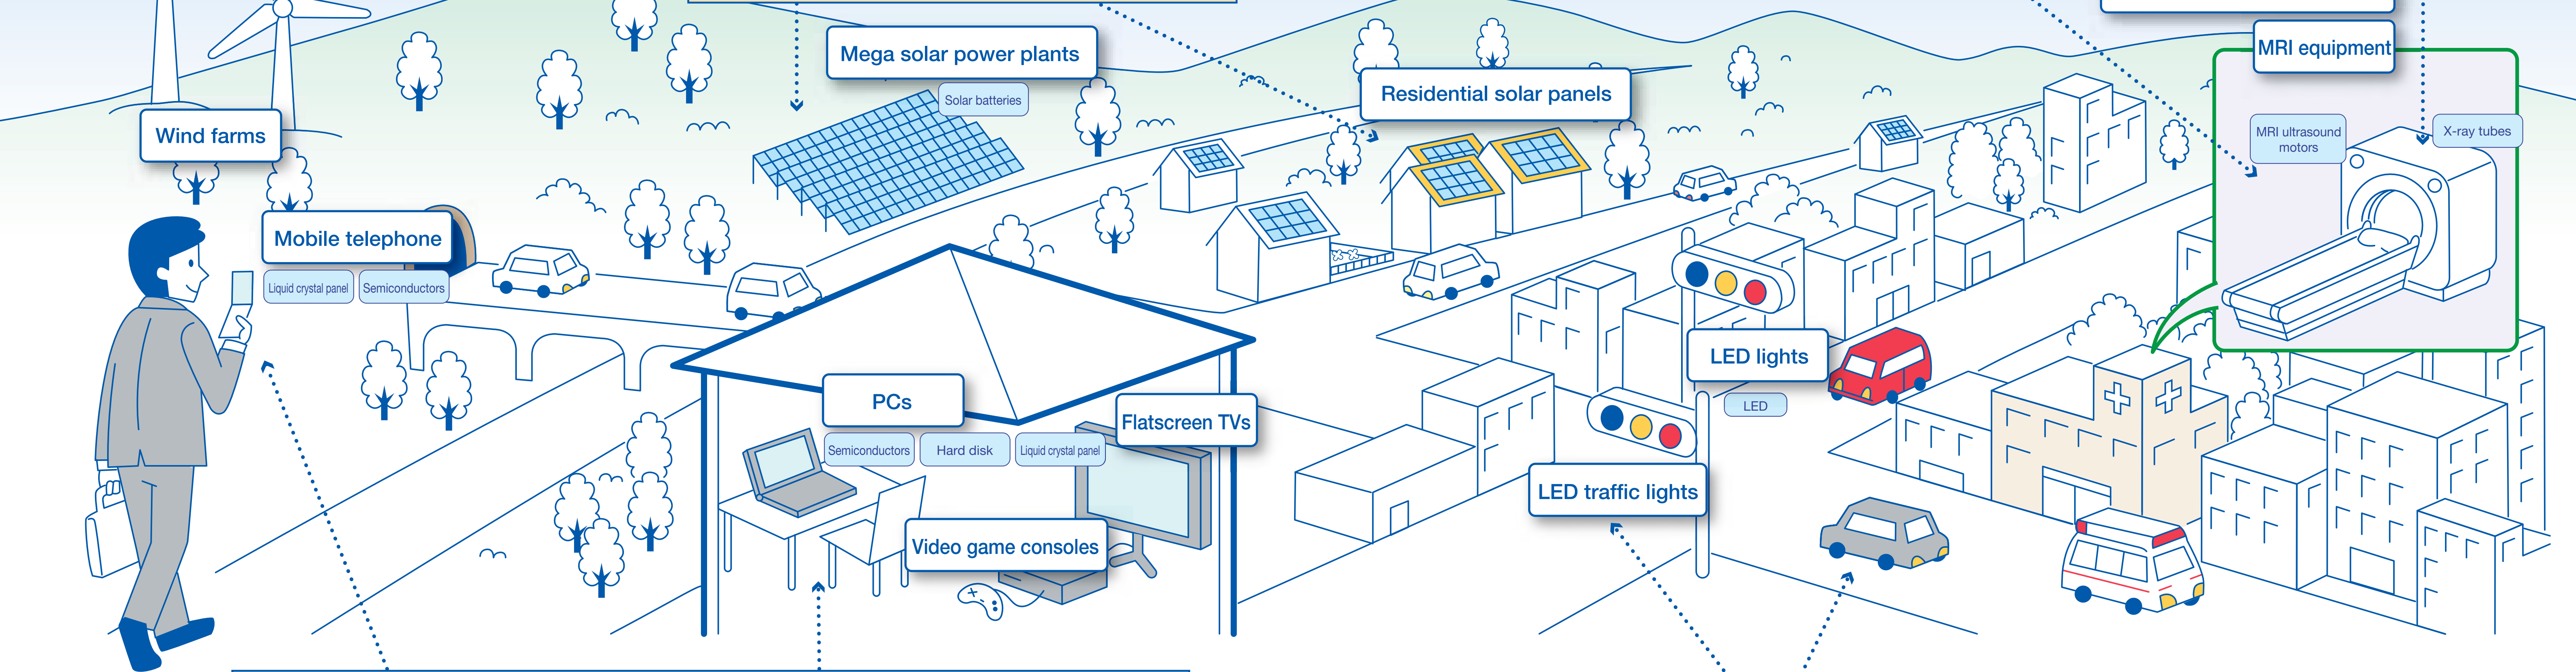
Magnetic field Rotates smoothly even in magnetic fields.

- Non-magnetic Hybrid Ceramic Bearing
- Ceramic Bearing

High temperature **Vacuum** **High Speed** Compatible with the harsh environment needed to generate X-rays.



- Spindle Unit for X-ray Tube



Corrosion Can be used in the corrosive acid/alkaline environments needed for LC panel manufacturing.

- Corrosion Resistant Hybrid Ceramic Bearing
- Corrosion Resistant Bearing Unit with Aligning Ring
- Ceramic Bearing
- Corrosion Guard Pro Bearing

Clean **Vacuum** Helps restrain gas and dust generation to maintain a clean semiconductor manufacturing environment.

- Clean Pro Bearing
- Clean Pro PRZ Bearing
- Touchdown Bearings for Turbo Molecular Pump
- MO Bearing
- MG Bearing
- PN Bearing

High temperature Can be used in the harsh environment needed to manufacture LEDs.

- WS Bearing
- PN Bearing
- Full Complement Ceramic Ball Bearing

🟩	EXSEV bearings are used in the product itself.
🟨	EXSEV bearings are used during manufacturing.

EXSEV Bearings: Table of Characteristics

Major Uses	Products	Applicable Environments 1)																Performance and functions	Bearing Number 4) (Cage Code)	Page
		Limiting Speeds		Permissible radial load	Operating Temp. (℃)							Vacuum (Pa)			Cleanliness (class) 3)					
		dn value 2)	Max.(min^{-1})		~120	~200	~260	~300	~350	~800		Atmosphere	10^{-5}	10^{-10}	1000	100	10

1) Solid lubricants are used in the majority of applicable environments.
2) *dn* value: Bearing bore diameter (mm) × Rotational speed (min^{-1})
3) The cleanliness classes may vary depending on operating conditions.

4) The four blank boxes(□□□□) represent the basic number of the bearing. A basic number consists of three or four alphanumeric characters.
A bearing number may be used as a convenience in the case of any queries to JTEKT.

EXSEV Bearing : Table of standard delivery times

*As situations may charge, contact JTEKT regarding details such as the period for delivery.

Note) As a general rule, the internal clearance of bearings is as shown on the right.						C3	C3	C3	C3 Packed with KDL grease	C3	CN	CN		CN	CN	CN 2)	CN 2) Packed with KHD grease.	CN 2) Packed with KHD grease.	— 3)	C4	C4	C3	C3	CN	C3

1) The basic load rating (C_r) indicates the value for high-carbon steel chrome bearings. These values are used in the calculation of the permissible radial load.
1) The basic load rating (C_r) of each bearing may differ from the values shown in this table.

2) The bearing number marked with an asterisk have a C3 clearance.
3) Because the configuration of these bearings is that of angular contact ball bearings, their basic bearing number and basic load ratings differ from those shown in this table.

Clean Pro PRZ Bearing

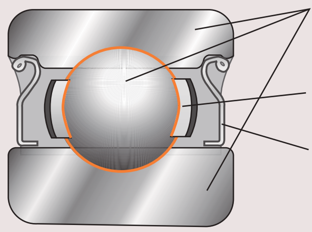
Typical bearing number

SE□□□□ZZSTPRZ (YS)

Advantages

This bearing has a fluoropolymer gel coating on its rolling surfaces as the lubricant.

Specifications



Outer/inner rings and balls
Martensitic stainless steel
＊Ceramic ball types are also available.

Cage
Austenitic stainless steel

Shield
Austenitic stainless steel

Lubrication
Clean pro PRZ coating

Performance

Cleanliness : Class 10[1]
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −30 to 200 ℃
Limiting speed : $dn < 10\ 000$[2]
1 000 min^{-1} max.
Permissible radial load : ≦ 5% of the basic dynamic load rating[3]

Applications

- Semiconductor manufacturing equipment
- Lithography equipment
- Transfer systems
- Vacuum motors
- Vacuum equipment

High Temperature Clean Pro Bearing

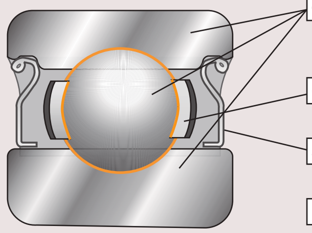
Typical bearing number

SE□□□□ZZSTPRB (YS)

Advantages

This bearing has a fluoropolymer coating on its rolling surface as the lubricant.

Specifications



Outer/inner rings and balls
Martensitic stainless steel
＊Ceramic ball types are also available.

Cage
Austenitic stainless steel

Shield
Austenitic stainless steel

Lubrication
High temperature clean pro coating

Performance

Cleanliness : Class 10[1]
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −100 to 260 ℃
Limiting speed : $dn < 10\ 000$[2]
1 000 min^{-1} max.
Permissible radial load : ≦ 3% of the basic dynamic load rating[3]

Applications

- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Transfer systems
- Vacuum equipment
- Sputtering equipment

Clean Pro Bearing

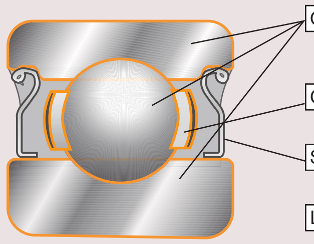
Typical bearing number

SE□□□□ZZSTPR (YS)

Advantages

This bearing is lubricated with a fluoropolymer coating over the entire surface of all bearing components.

Specifications



Outer/inner rings and balls
Martensitic stainless steel
＊Ceramic ball types are also available.

Cage
Austenitic stainless steel

Shield
Austenitic stainless steel

Lubrication
Clean pro coating

Performance

Cleanliness : Class 10[1]
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −100 to 200 ℃
Limiting speed : $dn < 10\ 000$[2]
1 000 min^{-1} max.
Permissible radial load : ≦ 3% of the basic dynamic load rating[3]

Applications

- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Vacuum equipment
- Lithography equipment
- Sputtering equipment
- Vacuum motors

DL Bearing

Typical bearing number

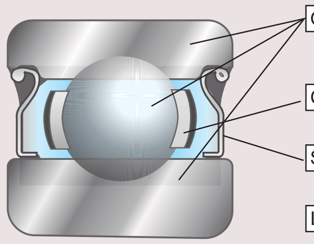
SV□□□□ZZST (YS)

Advantages

This bearing is lubricated with the packed fluorinated KDL grease, which is suitable for use in clean environments and vacuum environments.

* KDL grease can also be sold as a standalone product. For details, see page 19.

Specifications



Outer/inner rings and balls
Martensitic stainless steel
＊Ceramic ball types are also available.

Cage
Austenitic stainless steel

Shield
Austenitic stainless steel

Lubrication
KDL grease

Performance

Cleanliness : Class 100[1]
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −30 to 200 ℃
Limiting speed : $dn < 40\ 000$[2]

Applications

- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Transfer robots
- Vacuum pumps

1) The cleanliness class number represents specific environments where the individual products are useful. The cleanliness of the products themselves may vary depending on operating conditions.
2) When used in an environment where cleanliness is not a significant factor, the product can be used at higher speed, reaching the same limiting speed as that of standard products.

3) The permissible radial load indicates the approximate size of radial load the bearing can carry. If the bearing carries an axial load, the permissible radial load may be lower. Refer to page 5 for each product's basic dynamic load rating (*Cr*).

FA Bearing

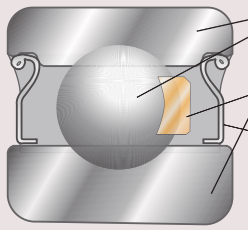
Typical bearing number

SE□□□□ZZST (FA)

Advantages

This bearing is lubricated with a solid fluoropolymer lubricant, which offers superior lubrication performance.
The cage is made from a low-particle-emission fluorocarbon resin.

Specifications



Outer/inner rings and balls
Martensitic stainless steel
＊Ceramic ball types are also available.

Cage
Fluorocarbon resin

Shield
Austenitic stainless steel

Lubrication
Fluorine polymer (solid lubricant)

Performance

Cleanliness : Class 1 000 [1]
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −100 to 200 ℃
Limiting speed : $dn < 10\ 000$ [2]
1 000 min^{-1} max.
Permissible radial load : ≦ 1% of the basic dynamic load rating [3]

Applications

- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Transfer systems
- Inspection systems

High Corrosion Resistant Ceramic Bearing

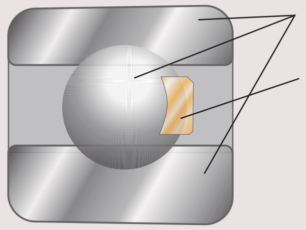
Typical bearing number

NCZ□□□□ (FA)

Advantages

This bearing uses a silicon carbide ceramic material, which is resistant to strong acids and alkalis.

Specifications



Outer/inner rings and balls
Ceramic (silicon cabide)

Cage
Fluorocarbon resin

Lubrication
Fluorine polymer (solid lubricant)

Performance

Cleanliness : Class 1 000 [1]
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −100 to 200 ℃
Limiting speed : $dn < 10\ 000$
1 000 min^{-1} max.
Permissible radial load : ≦ 1% of the basic dynamic load rating [3]

Applications

- Aluminum electrolytic capacitor manufacturing equipment

Corrosion Resistant Ceramic Bearing

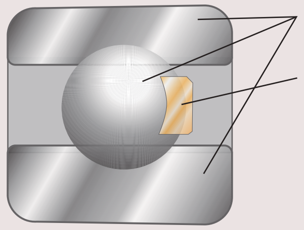
Typical bearing number

NCT□□□□ (FA)

Advantages

This bearing has its components made of corrosion resistant silicon nitride and is lubricated with fluoropolymer. This bearing can be used even in a highly corrosive solution.

Specifications



Outer/inner rings and balls
Ceramic (corrosion resistant silicon nitride)

Cage
Fluorocarbon resin

Lubrication
Fluorine polymer (solid lubricant)

Performance

Cleanliness : Class 1 000 [1]
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −100 to 200 ℃
Limiting speed : $dn < 10\ 000$
1 000 min^{-1} max.
Permissible radial load : ≦ 1% of the basic dynamic load rating [3]

Applications

- Liquid crystal film manufacturing equipment
- Aluminum electrolytic capacitor manufacturing equipment
- Plating equipment
- Synthetic fiber manufacturing equipment
- Food container washing machine

Ceramic Bearing

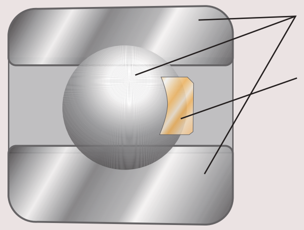
Typical bearing number

NC□□□□ (FA)

Advantages

This bearing has its components made of silicon nitride ceramic and uses fluoropolymer as the lubricant. It is typically used in vacuum and corrosive environments.

Specifications



Outer/inner rings and balls
Ceramic (silicon nitride)

Cage
Fluorocarbon resin

Lubrication
Fluorine polymer (solid lubricant)

Performance

Cleanliness : Class 1 000 [1]
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −100 to 200 ℃
Limiting speed : $dn < 10\ 000$
1 000 min^{-1} max.
Permissible radial load : ≦ 1% of the basic dynamic load rating [3]

Applications

- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Semiconductor inspection equipment
- Synthetic fiber manufacturing equipment
- Canning machinery
- Ultrasonic motors

---

1) The cleanliness class number represents specific environments where the individual products are useful. The cleanliness of the products themselves may vary depending on operating conditions.
2) When used in an environment where cleanliness is not a significant factor, the product can be used at higher speed, reaching the same limiting speed as that of standard products.
3) The permissible radial load indicates the approximate size of radial load the bearing can carry. If the bearing carries an axial load, the permissible radial load may be lower. Refer to page 5 for each product's basic dynamic load rating (Cr).

Corrosion Guard Pro Bearing

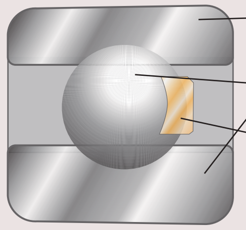
Typical bearing number

3NCT□□□□UN4 (PN)

Advantages

This bearing is harder than normal corrosion-resistant steel, which gives it a long service life and excellent load carrying capability. It is lubricated with the solid lubricant of the molded PEEK resin cage and can be used in corrosive liquids or water.

Specifications



Outer/inner rings
High-hardness and corrosion-resistant stainless steel

Balls
Ceramic (silicon nitride)

Cage
PEEK resin

Performance

Cleanliness : -
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −30 to 300 ℃
Limiting speed : dn < 10 000
1 000 min^{-1} max.
Permissible radial load : ≦ 3% of the basic dynamic load rating [2]

Applications

- High-performance film manufacturing equipment
- Cleaning equipment

Corrosion Resistant Hybrid Ceramic Bearing

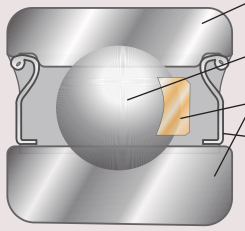
Typical bearing number

3NC□□□□ZZMD4 (FA)

Advantages

This bearing uses a stainless steel variety that has excellent corrosion resistance. As the lubricant, fluoropolymer is used. It is compatible with underwater use.

Specifications



Outer/inner rings
Precipitation hardening stainless steel

Balls
Ceramic (silicon nitride)

Cage
Fluorocarbon resin

Shield
Austenitic stainless steel

Lubrication
Fluorine polymer (solid lubricant)

Performance

Cleanliness : Class 1 000 [1]
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −100 to 200 ℃
Limiting speed : dn < 10 000
1 000 min^{-1} max.
Permissible radial load : ≦ 1% of the basic dynamic load rating [2]

Applications

- Semiconductor manufacturing equipment
- Chemical manufacturing equipment
- Food machinery
- Cleaning equipment

---

[1] The cleanliness class number represents specific environments where the individual products are useful. The cleanliness of the products themselves may vary depending on operating conditions.

SK Bearing

Typical bearing number

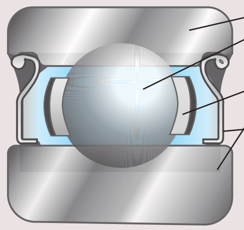
SK□□□□ZZST (YS)

Advantages

This bearing has its components made of stainless steel, and is lubricated with lithium containing KHD grease, which is packed in adequate amounts. This bearing is suitable for use in slightly corrosive environments.

＊Unsuitable for clean environments due to anticorrosive treatment.

Specifications



Outer/inner rings and balls
Martensitic stainless steel

Cage
Austenitic stainless steel

Shield
Austenitic stainless steel

Lubrication
KHD grease

Performance

Cleanliness : -
Ambient pressure : Atmospheric pressure
Temperature : −30 to 120 ℃
Limiting speed : Equal to the dn value of normal bearings

Applications

- Chemical equipment
- Transfer systems

Full Complement Ceramic Ball Bearing

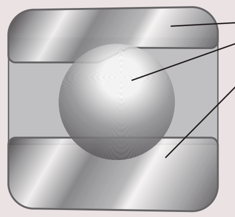
Typical bearing number

NC□□□□V (−)

Advantages

This bearing has all components made of ceramic for use in an ultrahigh temperature environments. No cage is provided. Being an angular contact ball bearing, this bearing is normally used in pairs.

Specifications



Outer/inner rings and balls
Ceramic (silicon nitride)

Cage
Not provided

Lubrication
Not provided

Performance

Cleanliness : -
Ambient pressure : Atmospheric pressure to 10^{-10} Pa
Temperature : −200 to 800 ℃
Limiting speed : dn < 4 000
500 min^{-1} max.
Permissible radial load : ≦ 1% of the basic dynamic load rating [2]

Applications

- Baking furnace cars
- Fans in furnaces

---

[2] The permissible radial load indicates the approximate size of radial load the bearing can carry. If the bearing carries an axial load, the permissible radial load may be lower. Refer to page 5 for each product's basic dynamic load rating (Cr).

WS Bearing

Typical bearing number

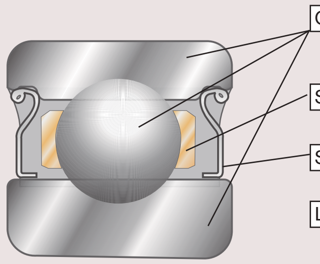
SE□□□□ZZST (WS)

Advantages

This bearing has extremely heat resistant tungsten disulfide included in the separator material as the lubricant.

＊We recommend that this bearing is used with horizontal axes. For information on using this bearing with items other than horizontal axes, consult JTEKT.

Specifications



Outer/inner rings and balls
Martensitic stainless steel
＊Ceramic ball types are also available.
Separator
Sintered composite material including tungsten disulfide
Shield
Austenitic stainless steel
Lubrication
Solid lubricant including tungsten disulfide

Performance

Cleanliness : -
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −100 to 350 ℃
Limiting speed : $dn < 4\ 000$
500 min^{-1} max.
Permissible radial load : ≦ 5% of the basic dynamic load rating 1)

Applications

- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Vacuum evaporatior
- Plasma display panel manufacturing equipment

MG Bearing

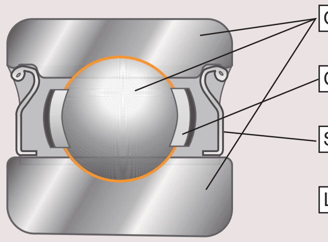
Typical bearing number

SE□□□□ZZSTMG3 (YS)

Advantages

This bearing has silver ion plated on the stainless steel balls, as the lubricant.

Specifications



Outer/inner rings and balls
Martensitic stainless steel
Cage
Austenitic stainless steel
Shield
Austenitic stainless steel
Lubrication
Silver ion plating

Performance

Cleanliness : -
Ambient pressure : 10^{-3} to 10^{-10} Pa
Temperature : −250 to 350 ℃
Limiting speed : $dn < 10\ 000$
1 000 min^{-1} max.
Permissible radial load : ≦ 3% of the basic dynamic load rating 1)

Applications

- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Vacuum evaporatior
- Medical equipment
- Vacuum motors

---

1) The permissible radial load indicates the approximate size of radial load the bearing can carry. If the bearing carries an axial load, the permissible radial load may be lower. Refer to page 5 for each product's basic dynamic load rating (Cr).

PN Bearing

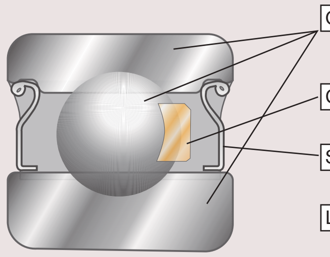
Typical bearing number

SE□□□□ZZST (PN)

Advantages

This bearing has a highly heat resistant solid lubricant, such as molybdenum disulfide included in the cage material.

Specifications



Outer/inner rings and balls
Martensitic stainless steel
＊Ceramic ball types are also available.
Cage
PEEK resin
Shield
Austenitic stainless steel
Lubrication
Solid lubricant including molybdenum disulfide

Performance

Cleanliness : -
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −30 to 300 ℃
Limiting speed : $dn < 10\ 000$
1 000 min^{-1} max.
Permissible radial load : ≦ 3% of the basic dynamic load rating 1)

Applications

- Carton manufacturing equipment
- LCD cleaning equipment

MO Bearing

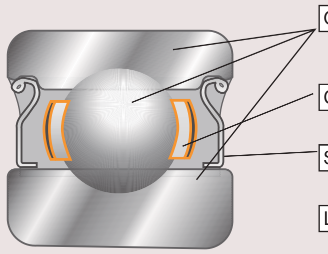
Typical bearing number

SE□□□□ZZSTMSA7 (YS)

Advantages

This bearing has molybdenum disulfide baked on the surface of the stainless steel cage, as the lubricant.

Specifications



Outer/inner rings and balls
Martensitic stainless steel
＊Ceramic ball types are also available.
Cage
Austenitic stainless steel
Shield
Austenitic stainless steel
Lubrication
Molybdenum disulfide

Performance

Cleanliness : -
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −100 to 300 ℃
Limiting speed : $dn < 10\ 000$
1 000 min^{-1} max.
Permissible radial load : ≦ 3% of the basic dynamic load rating 1)

Applications

- Semiconductor manufacturing equipment
- LCD manufacturing equipment
- Vacuum evaporator
- Turbo molecular pump
- Rotary furnaces

Magnetic field environment

Non-magnetic Hybrid Ceramic Bearing

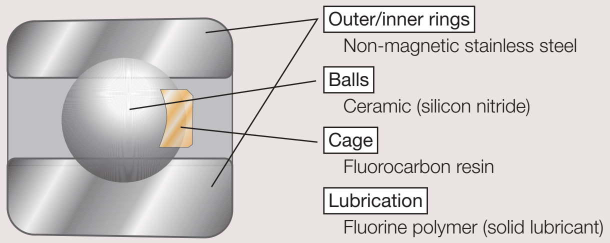
Typical bearing number

3NC□□□□YH4 (FA)

Advantages

This bearing uses non-magnetic stainless steel. It includes fluoropolymer as the lubricant. This bearing can be used in a vacuum environment.

Specifications



Performance

Cleanliness : Class 1 000 [1]
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −100 to 200 ℃
Limiting speed : $dn < 10\ 000$ [2]
1 000 min^{-1} max.
Permissible radial load : ≦ 1% of the basic dynamic load rating [3]

Applications

- Semiconductor manufacturing equipment
- Semiconductor inspection equipment
- Canning machinery
- Superconductivity-related equipment
- Welder

Electric field environment

Hybrid Ceramic Bearing

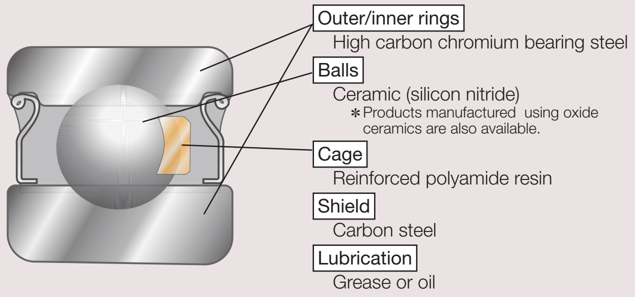
Typical bearing number

3NC□□□□ZZ (FG)

Advantages

This bearing is a standard hybrid ceramic bearing. Lubricated with grease or oil, it can be used as an insulating bearing or high speed bearing.

Specifications



Performance

Cleanliness : -
Ambient pressure : Atmospheric pressure
Temperature : −30 to 120 ℃
Limiting speed : Equal to or higher than 1.2 times the limiting speed of steel bearings

Applications

- High speed stranding machine guide rollers
- Motors
- Generators

Hygiene

Grease-filled Bearing for Food Machinery

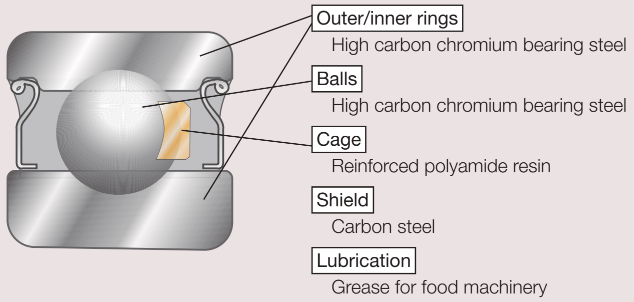
Typical bearing number

□□□□ZZ (FG)

Advantages

This bearing is filled with grease for food machinery. It can be used in hygienic environments such as food machinery or cosmetic/pharmaceutical production machinery.

Specifications



Performance

Cleanliness : -
Ambient pressure : Atmospheric pressure
Temperature : −30 to 120 ℃
Limiting speed : Equal to or higher than 1.2 times the limiting speed of steel bearings

Applications

- Food machinery
- Chemical manufacturing equipment

K Series Full Complement Hybrid Ceramic Ball Bearing

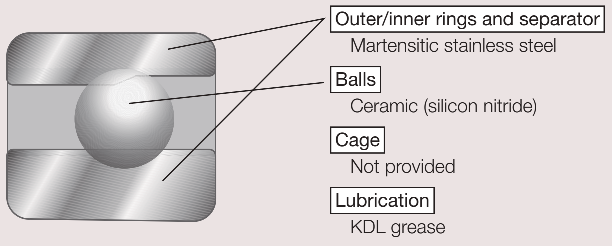
Typical bearing number

3NC□□□□VST-1

Advantages

This bearing is based on the K series super thin section ball bearing, which is widely used in industrial robots. Provided with some adaptations, this bearing is compatible with clean or vacuum environments. It uses fluorinated KDL grease as the standard lubricant. However, it can also be used with other solid greases such as Clean Pro.

Specifications



Performance

Cleanliness : Class 100 [1]
Ambient pressure : Atmospheric pressure to 10^{-5} Pa
Temperature : −30 to 200 ℃

Applications

- Wafer transfer robot
- LCD manufacturing equipment
- Semiconductor manufacturing equipment

Remark

For details, please refer to the EXSEV BEARINGS AND CERAMIC BEARINGS catalog (CAT.NO.B2004E) or consult JTEKT.

---

1) The cleanliness class number represents specific environments where the individual products are useful. The cleanliness of the products themselves may vary depending on operating conditions.

2) When used in an environment where cleanliness is not a significant factor, the product can be used at higher speed, reaching the same limiting speed as that of standard products.

3) The permissible radial load indicates the approximate size of radial load the bearing can carry. If the bearing carries an axial load, the permissible radial load may be lower. Refer to page 5 for each product's basic dynamic load rating (Cr).

Linear Motion Ball Bearings

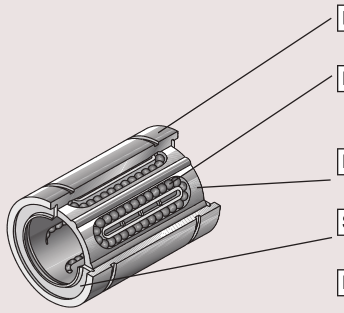
Typical bearing number

○○SDM□□ST△△

Advantages

The linear motion ball bearings are a high precision product that moves linearly in axial directions while having rolling contact with the shaft. Having balls, retainer and shields housed in an external cylinder, this compact bearing moves linearly without limit to the stroke distance.

Specifications



External cylinder
Martensitic stainless steel

Balls
Martensitic stainless steel or ceramics (silicone nitride)

Retainer
Austenitic stainless steel

Shields
Precipitation hardened stainless steel

Lubrication
KDL grease (Standard specification)
Clean pro coating (Clean specification)

Performance

Lubrication specification	Performance		
	Cleanliness	Temperature	Ambient pressure
KDL	Class 100	−30 to 200 ℃	Atmospheric pressure to 10^{-5} Pa
Clean Pro	Class 10	−100 to 200 ℃	

Remark

Symbols determined according to factors such as the type, size, and material are entered in place of ○, □, and △.
For more information, including details of factors other than those mentioned above, please refer to the EXSEV BEARINGS AND CERAMIC BEARINGS catalog (CAT.NO.B2004E) or consult JTEKT.

Linear Way Bearing Units

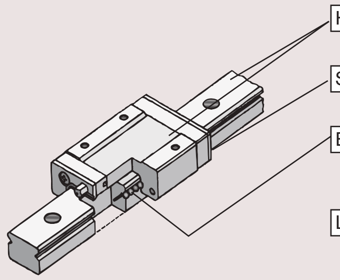
Typical bearing number

○○LW□□□□△△

Advantages

The Linear Way Bearing Units have a slide unit in which balls circulate, allowing the slide unit to move linearly on the track rail without limit. High precision linear motion can be obtained easily by fixing the slide unit and track rail with bolts.

Specifications



Housing and track rail
Martensitic stainless steel

Shields
Austenitic stainless steel

Balls
Martensitic stainless steel or ceramics (silicone nitride)

Lubrication
KDL grease (Standard specification)
Clean pro coating (Clean specification)

Performance

Lubrication specification	Performance		
	Cleanliness	Temperature	Ambient pressure
KDL	Class 100	−30 to 200 ℃	Atmospheric pressure to 10^{-5} Pa
Clean Pro	Class 10	−100 to 200 ℃	

Remark

Symbols determined according to factors such as the type, size, and material are entered in place of ○, □, and △.
For more information, including details of factors other than those mentioned above, please refer to the EXSEV BEARINGS AND CERAMIC BEARINGS catalog (CAT.NO.B2004E) or consult JTEKT.

Ceramic Balls

Advantages

JTEKT also supplies Ceramic Balls (silicon nitride), which have excellent resistance to wear and seizure, and are usable in corrosive environments and ultrahigh vacuums. Other major features of these balls are excellent heat resistance (up to 800℃), high rigidity, lightweight (40% compared to bearing steel), non-magnetic, and have insulating characteristics.
The Ceramic Balls are useful in many applications such as jigs, tools, gauges, solenoid valves, check valves, other valve varieties, high grade bicycle parts, automotive parts, and machine components.

Table of Dimensions and Masses

Nominal dimension		Nominal outside diameter mm	Precision grade [1]	Mass [2] (per piece)
mm	inch			
0.8		0.800 00	3 and 5	0.866 mg
1.0		1.000 00		1.691 mg
1.2		1.200 00		2.922 mg
	1/16	1.587 50		6.766 mg
2.0		2.000 00		13.530 mg
	3/32	2.381 25		22.836 mg
	7/64	2.778 12		36.262 mg
	1/8	3.175 00		54.129 mg
3.5		3.500 00		72.511 mg
	5/32	3.968 75		0.105 7g
	3/16	4.762 50		0.182 7g
	7/32	5.556 25		0.290 1g
	15/64	5.953 12		0.356 8g
	1/4	6.350 00		0.433 0g
	17/64	6.746 88	5	0.519 4g
	9/32	7.143 75		0.616 6g
	5/16	7.937 50		0.845 8g
	11/32	8.731 25		1.125 7g
	3/8	9.525 00		1.461 5g
	13/32	10.318 75		1.858 2g

Notes 1) For the grades, those specified in JIS B 1501 shall apply.
2) The masses are calculated on the basis of 3.23 g/cm³ in density.

Nominal dimension		Nominal outside diameter mm	Precision grade [1]	Mass [2] (per piece)
mm	inch			
	7/16	11.112 75	5 and 10	2.320 8g
	15/32	11.906 25		2.854 5g
	1/2	12.700 00		3.46 g
	17/32	13.493 75		4.2g
	9/16	14.287 50	40	4.9g
	19/32	15.081 25		5.8g
	5/8	15.875 00		6.8g
	3/4	19.050 00		11.7g
	13/16	20.637 50		14.9g

KDL Grease

Advantages

This is low-particle-emission fluorocarbon grease for use in vacuum environments.

- KDL grease expresses its high properties when used with rolling bearings, linear-motion bearings, and ball screws.
- JTEKT also respond to requests only for grease, so consult JTEKT with such requests.
- This grease can be used up to an atmospheric pressure of 10^{-5} Pa, but consult JTEKT for information on using this grease under conditions combining high temperature and high vacuum.

Performance

Characteristics

Thickener		Fluorocarbon resin
Base oil		Fluorocarbon oil
Dropping point		None
Evaporation amount (200 ℃ for 22 h)		0.1 wt% or less
Degree of oil separation (100 ℃ for 24 h)		2 wt% or less
Operating temperature range	Atmosphere	−30 to 200 ℃
	Vacuum	−30 to 100 ℃

Particle-emission characteristic when used to lubricate a rolling bearing
(number of particles per 2.83 × 10^{-3} m^3 [0.1 ft^3])

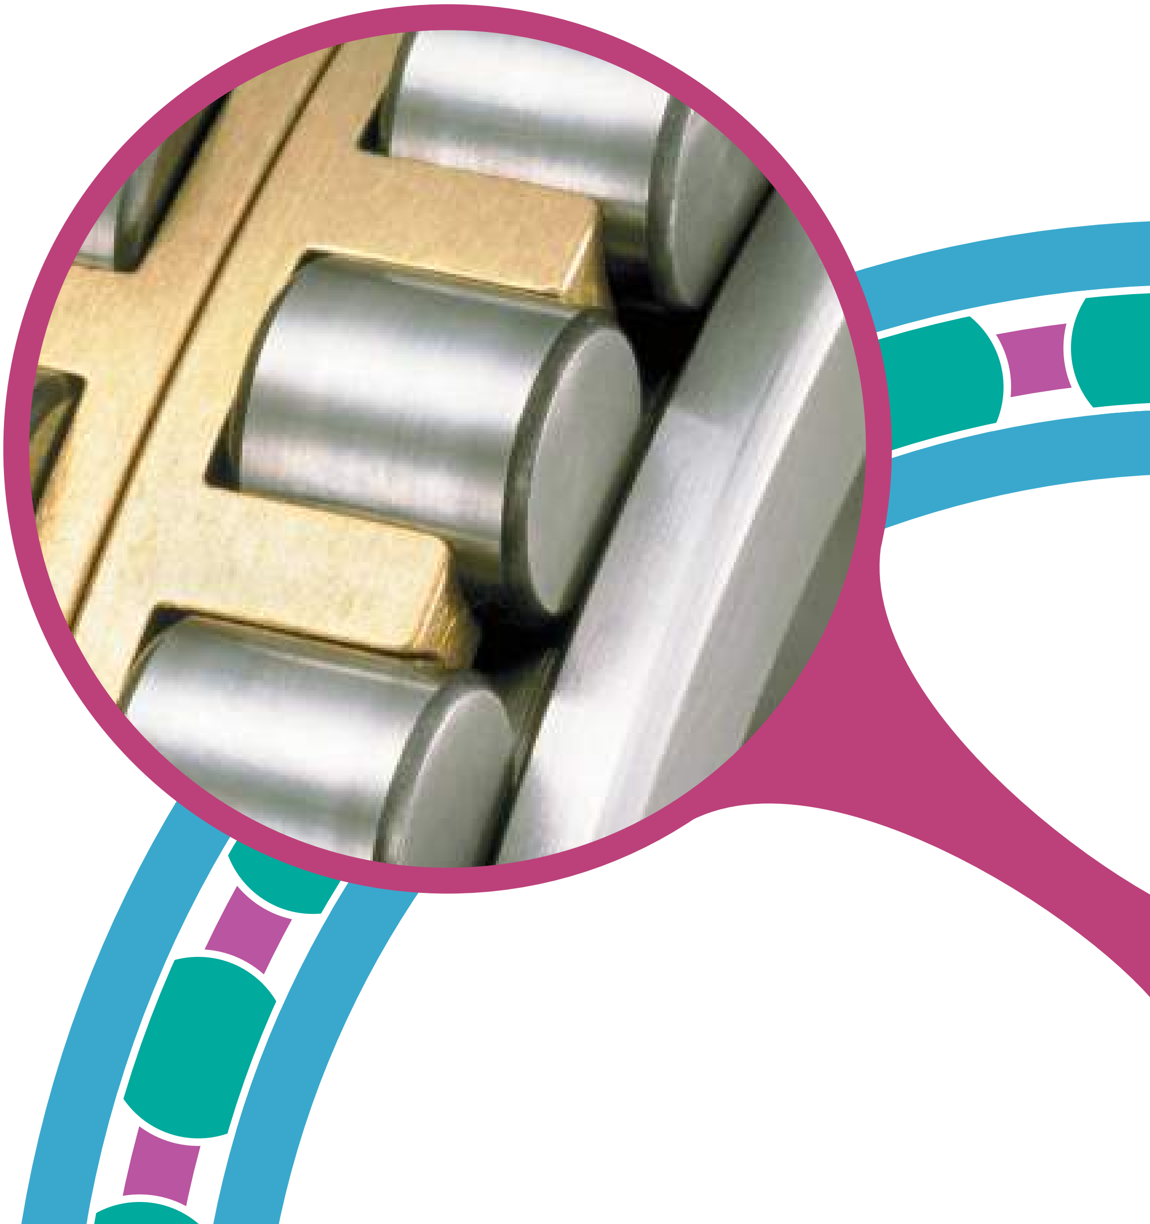
Ball & Roller Bearings:

Failures, Causes and Countermeasures



JTEKT

JTEKT CORPORATION

CAT.NO.B3001E

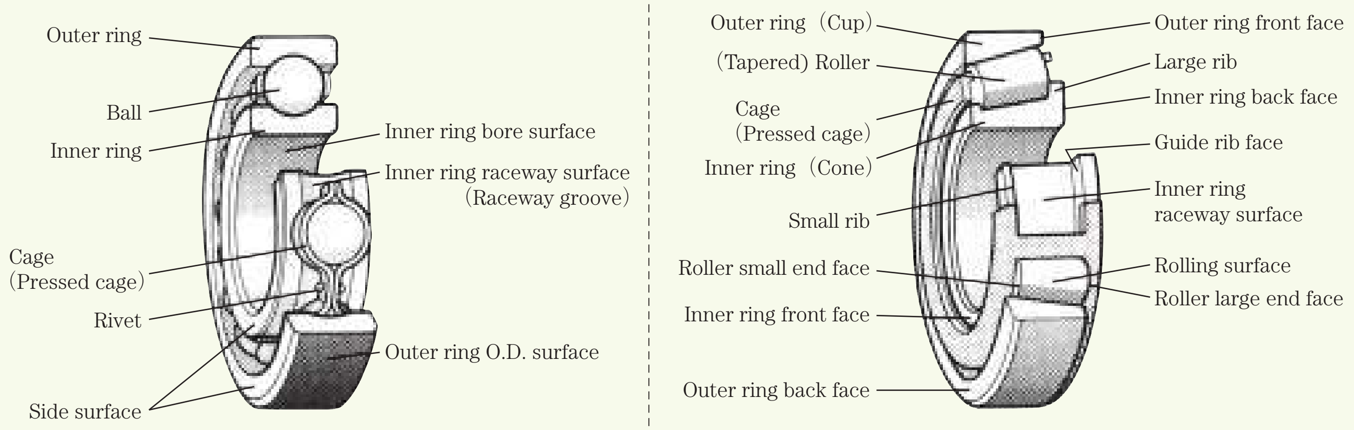
Ball & Roller Bearings: Failures, Causes and Countermeasures

Ⅰ. Bearing Fracture

Ⅱ. Bearing Failure

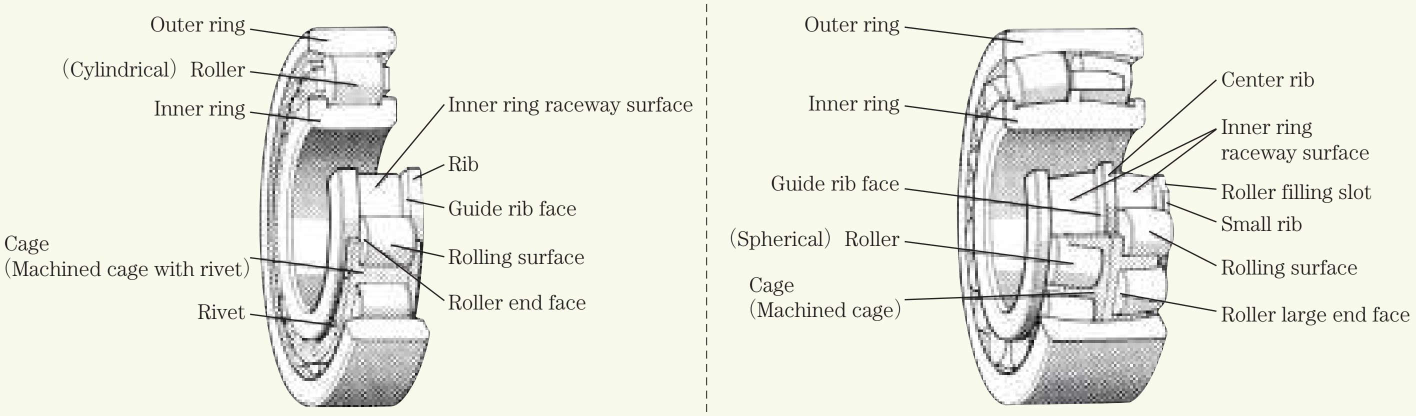
Ⅲ. Failures, Causes and Countermeasures

– Rolling bearing: Description of each part –



(a) Deep groove ball bearing

(c) Tapered roller bearing



(b) Cylindrical roller bearing

(d) Spherical roller bearing

Introduction

Even when bearings are being used under ideal conditions, failures of bearings are caused by deterioration of the material due to rolling fatigue. Generally, the service life of bearings is expressed either as a period of time or as the total number of rotations before the occurrence of failures in the inner ring, outer ring or rolling element because of rolling fatigue, due to repeated stress.

Rolling bearings sometimes fracture earlier than expected. The following causes should be considered;

① Inappropriate use of bearings
② Faulty installation or improper processing
③ Improper lubricant, lubrication method or sealing device
④ Inappropriate speed and operating temperature
⑤ Contamination by foreign matter during installation
⑥ Abnormally heavy load

When bearing failure is found, even if it is insignificant, it is important to investigate the phenomenon to determine the causes. At this time, not only the bearing but also the shaft, housing, and lubricant used with the bearing should be comprehensively investigated, together with the bearing.

To judge the causes of failure, sufficient knowledge and experience in bearings and lubricants and a good understanding of the characteristics of the equipment are necessary. In addition, consideration of the installation conditions and operational process of the bearing is required.

〔Reference〕 Rated service life of rolling bearing

$$L = \left(\frac{C_r}{P}\right)^p$$

$$L_h = \frac{10^6}{60n}\left(\frac{C_r}{P}\right)^p$$

L : Rated service life, 10^6 rotations
L_h : Rated service life, h
C_r : Basic dynamic load rating, N
P : Dynamic equivalent load rating, N
n : Rotational speed, min^{-1}
p : 3 ……Ball bearing,
10/3 …Roller bearing

Ⅰ. Bearing Fracture

1. Time of fracture occurrence and causes

For failure analysis, it is important to accurately determine the time a fracture occurs, because the possible causes of failure can be limited in according to the time of fracture occurrence.

For reference, time of fracture occurrence and related causes are categorized and listed in Table 1–1.

Table 1–1 Time of Breakage Occurrence and Causes

Causes / Time of fracture occurrence	Inappropriate use of bearings	Faulty design of shaft, housing or other installation aspects or improper processing	Improper lubricant, lubrication method or sealing device	Defect in bearings	Mis-mounting of bearings	Defect in sealing device, contamination of water, dust or other foreign matters, or shortage of lubricant
(1) Fracture occurring immediately after bearings were mounted or within a short time after mounting	○	○	○	○	○	
(2) Fracture occurring immediately after overhaul			○		○	
(3) Fracture occurring immediately after lubricant was supplied			○			
(4) Fracture occurring immediately after repair or removal of shaft, housing or other parts		○	○		○	
(5) Fracture occurring during normal operation			○		○	○

2. Abnormal operations, their causes and countermeasures

Causes and countermeasures of abnormal operations are categorized and listed in Table 1–2.

Table 1–2 Abnormal Operations, their Causes and Countermeasures

Abnormal operation		Causes	Countermeasures (supplementary countermeasures)
Increase in temperature		1. Excessively tight bearing internal clearance	Replace with a new bearing.（Correct bearing internal clearance and interference.）
		2. Creep on bearing ring	Replace with a new bearing.（Correct interference.）
		3. Excessively heavy load	Remounting（Correct load by adjusting housing.）
		4. Improper centering in mounting	Remounting（Correct centering, or widen mounting clearance.）
		5. Defect in bearing	Replace with a new bearing.（Take proper countermeasures, after inspecting the causes.）
		6. Improper volume of lubricant	Correct lubricant volume.
		7. Improper lubricant	Change to proper lubricant.
		8. Improper lubrication method	Correct lubrication method by remounting or replacement with new parts.
		9. Oil seal – Excessive interference – Shortage of lubricant – Improper oil seal	Correct interference by installing new seal or changing seal type. Supply lubricant. Correct oil seal type or sealing method.
		10. Abnormal contact with labyrinth seal or other parts	Remounting or modify parts.
Excessively loud noise or foreign noise	Noise at uniform intervals	1. Flaws including scratches, brinelling, etc.	Repair bearings or replace with new ones.（Care should be taken in handling bearings.）
		2. Electric pitting	Repair bearings or replace with new ones.（Prevent electricity from passing through bearings by modifying their design.）
		3. Cracking of inner or outer ring（s）	Replace with a new bearing.
		4. Flaking of raceway surface	Replace with a new bearing.
		5. Receway surface roughened by foreign matter（s）	Repair bearings or replace with new ones.
	High-pitched metallic noise	1. Excessively narrow internal clearance	Replace with a new bearing or widen internal clearance.
		2. Shortage of lubricant	Supply lubricant.
		3. Sliding of rolling element	Change to proper lubricant or decrease operational clearance.
	Noise at nonuniform intervals	1. Contamination by foreign matter（s）	Change to proper lubricant.
		2. Contact with another rolling part	Remounting or modify parts.
		3. Flaw or flaking on rolling element	Replace with a new bearing.
		4. Wear of cage	Replace with a new bearing.
Excessively high vibration		1. Contamination by foreign matter（s）	Change to proper lubricant.
		2. Excessively wide clearance	Remounting bearing or replace with a new one.
		3. Flaw on raceway surface or rolling contact surface	Replace with a new bearing.
Excessively large rotational torque		1. Improper mounting	Remounting（Widen internal clearance. Care should be taken with centering.）
		2. Improper sealing device	Remounting（Reduce interference of oil seal.）
		3. Improper lubricant	Decrease lubricant volume.（Care should be taken not to supply an excessive amount of lubricant.）

Ⅱ. Bearing Failure

1. Types of failure

Defects in the appearance of bearings are referred to as bearing failures. Table 2–1 describes bearing failures, first assigning a general term to each type of failure, then adding more detailed classifications.

Table 2–1 Bearing Failure

Bearing failures		Main cause (reference)
Failures	Failure details	
Rolling fatigue	Flaking, Pitting	Unavoidable
Wear	Wear, Fretting	
Fracture	Cracks, Chips	Improper handling
Flaw	Brinelling, Nicks, Scratches, Scuffing	
Rust	Rust, Corrosion	
Seizure	Seizure, Discoloration, Smearing	Improper lubrication
Creep	Creep	Improper fitting
Electric pitting	Electric pitting	Passage of electricity

2. Types of failure and parts in which they occur

Table 2–2 describes bearing failures, parts where they occur, and standards for judging the failures.

Table 2–2 Bearing Failures, Parts in which they Occur, and Standards for Judging Failures

Bearing failure	Bearing ring, Rolling element			Bearing ring	Cage	
	· Raceway surface · Rolling surface	· Roller guide surface · Cage guide surface · Roller end face	· Others	· Fitting surface	· Pocket surface · Guide surface	· Rivet
Flaking, Pitting	×	—	—	—	—	—
Wear	○	○	○	○	○	×
Fretting	○	—	—	○	—	—
Cracks	×	×	×	×	×	×
Chips	×	×	○	×	×	×
Brinelling	○	○	○	○	—	—
Nicks	○	○	○	○	○	○
Scratches	○	○	○	○	○	○
Scuffing	○	○	○	○	—	—
Rust	○	○	○	○	○	○
Corrosion	○	○	○	○	○	○
Pear skin	○	—	—	—	—	—
Discoloration	○	○	○	○	—	—
Smearing	○	○	—	—	—	—
Creep	—	—	—	○	—	—
Electric pitting	○	○	—	—	○	—
Seizure	×	×	×	×	×	—
Failure of cage	—	—	—	—	○	×

Notes） × : In principle, not reusable.
○ : Reusable in accordance with seriousnes of failure, by repairing or meeting required conditions.
— : No failure of this part.

3. Failures and causes

Table 2–3 describes failures and causes. For further detail, refer to Section "Ⅲ. Failures, Causes and Countermeasures".

Table 2–3 Failures and Causes

	Failure	Cause
Flaking	Circumference on one side (Fig. 1)	Excessive axial load
	Symmetrical flaking on each side (Fig. 2)	Inclined mounting, or shaft or housing not in the shape of a circle
	Flaking on one side or flaking in the form of an oblique line on raceway surface of bearing ring on fixed side (Fig. 3)	Distortion of shaft, insufficient centering, bearings not installed on shaft at the correct angle
	Partial flaking on thrust bearing	Eccentric mounting
	Flaking found on part only	Contamination by foreign matter(s), flaws, initial stage of flaking
Scratches, Scuffing	Scuffing on roller end face and guide rib face (Fig. 4)	Excessive axial load, improper lubrication
	Scraches on raceway surface	Grease of too high viscosity, excessive acceleration in starting
	Scratches on raceway surface oh thrust bearing	Sliding of rolling element caused by centrifugal force during rotation
Cracks, Chips	Cracks or chips of rolling element (Fig. 5)	Improper bearing material, excessive impact too wide internal clearance of cylindrical roller bearing
	Cracks or chips of inner ring or outer ring (Fig. 5)	Advanced stage of flaking, improper bearing material, interference too large, housing of inaccurate design
	Cracks, chips of rib (Fig. 5)	Impact in mounting, axial impact, load too heavy
	Cracks, chips of cage	Improper lubricant or lubrication method, high speed operation, vibration impact too strong, advanced stage of wear
Creep	Creep on inner/outer rings	Insufficient interference
Wear	Wear on inner/outer rings	Sliding abrasion, bearing of insufficient hardness, contamination by foreign matter(s), shortage of lubricant, improper lubrication
	Wear caused by creep	Creep
	Wear on cage	Contamination by foreign matter(s), improper lubrication, inclined bearing
Rust, Corrosion	Rust on inner ring bore surface or outer ring O.D. surface	Fretting, water, humidity
	Rust covering whole bearing surface, corrosion	Defective washing oil or lubricant, water, humidity
Others	False brinelling (Fig. 6)	Progressing stage of flaws caused by load from vibration when machine is not running.
	Fluting on raceway surface or roller rolling surface (Fig. 7)	Passage of electricity
	Discoloration	Heat generation, chemical action

Fig.5 Cracks and/or chips on inner ring or roller. (Spherical Roller Bearing)

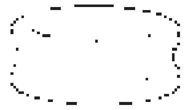

Fig.6 False brinelling on inner ring. (Deep Groove Ball Bearing)

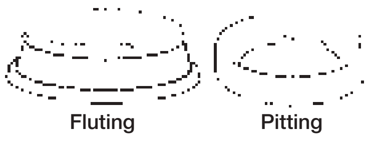

Fig.7 Type of Electric pitting.

Ⅲ. Failures, Causes and Countermeasures

1 Flaking, Pitting

Phenomena, causes and countermeasures

Phenomena

- ■ Flaking is a phenomena in which the bearing surface turns scaly and peels off due to contact load repeatedly received on the raceway and rolling surface during rotation.

  Occurrence of flaking indicates that the end of a bearing's service life is near.

- ● Pitting is a phenomena in which small holes 0.1 mm in depth are generated on the raceway surface by rolling fatigue.

※Flaking and pitting are often found at an early stage. In this case, countermeasures should be taken, after examining the causes.

Causes

Flaking and pitting occur early in a bearing's service life under the following conditions:

1) During operation, bearing internal clearance becomes narrower than specified.
2) Bearing ring is mounted at an inclination by mistake.
3) Flaw is created during mounting, or brinelling, nicks, rust, etc. occur on the raceway surface or rolling surface.
4) Inaccurate shape of shaft or housing (imperfect circle, depressions on surface.)

Countermeasures

■ Flaking

a) Use a bearing with heavier rated load.
b) Check if abnormal load is being generated.
c) Improve lubrication method to ensure better formation of lubricant film, by increasing the viscosity.
d) When a failure is discovered at an early stage, the countermeasures described above should be taken, after investigating the causes.

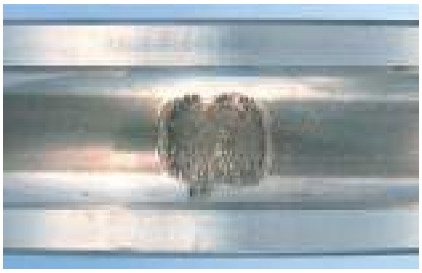
● Pitting

a) Increase viscosity of lubricant to ensure better formation of lubricant film.

(Care should be taken because foreign matters appear similar to holes caused by brinelling or corrosion.)

Examples of failures

■ Flaking on inner ring of Deep Groove Ball Bearing



(A-6977)

■ Flaking on inner ring of Cylindrical Roller Bearing

(A-7024)

■ Flaking on outer ring of Double-Row Cylindrical Roller Bearing

(A-6466, 6473)

■ Flaking on inner ring of Tapered Roller Bearing

(A-6644, 6645)

■ Flaking on inner ring of Spherical Roller Bearing

(A-6476)

2 Wear and Fretting

Phenomena, causes and countermeasures

Phenomena

■ Wear is caused mainly by sliding abrasion on parts including the roller end face and rib, cage pocket surface, cage, and the guide surface of the bearing ring.
Wear due to contamination by foreign matter and corrosion occurs not only to the sliding surface but also to the rolling surface.

● Fretting is a phenomena which occurs when slight sliding is repeatedly caused on the contact surface.
On the fitting surface, fretting corrosion occurs, generating a rust like powder.

▲ If bearings receive a vibration load when they stop or operate, slight sliding occurs in the section between the rolling element and bearing ring due to elastic distortion.
False brinelling, a flaw similar to brinelling, is generated by this condition.

Causes

■ Wear
1) Improper lubricant or shortage of lubricant.
2) Contamination by foreign matter(s).

● Fretting
1) Vibration load.
2) Slight vibration on fitting surface caused by load.

Countermeasures

■ Wear
a) Review and improvement of lubricant and lubrication method.
b) Filtering of oil.
c) Improvement of sealing.

● Fretting
a) Investigation and countermeasures for the source of vibration.
b) Investigation and increase of interference.
c) Enhancement of shaft rigidity.

Examples of failures

■ Wear on roller and face of Cylindrical Roller Bearing

(A-4718)

■ Wear on outer ring raceway surface of Double-Row Cylindrical Roller Bearing

(A-6714)

● Fretting on inner ring bore surface of Tapered Roller Bearing

(A-6649)

● Fretting on outer ring O.D. surface of Deep Groove Ball Bearing
Vertical fretting at symmetric positions 180° apart.

(A-6735)

▲ False brinelling on inner ring raceway surface of Deep Groove Ball Bearing

(A-7278)

3 Cracks and Chips

Phenomena, causes and countermeasures

Phenomena

■ Cracks include slight cracks, splitting and fracture.

● Chips are a type of failure occurring at a certain part of a bearing ring rib or corner of a roller.

Causes

■ Cracks

1) Heavy load.
2) Excessively heavy internal load caused by improper installation.
3) Excessive interference at fitting, or shaft and housing of improper shape.
4) Instantaneous heat generation of bearing caused by sudden sliding at rolling surface, sliding surface or fitting surface.
5) Abnormal heat is generated due to shortage of lubricant.

● Chips

1) Abnormally heavy axial load or impact load.
2) Partial impact of hammer or other tool used when bearing is mounting or dismounting.

Countermeasures

■ Cracks

a) Investigation followed by countermeasures for excessively heavy load.
b) Removal of thermal impact.
c) Improvement of interference (decrease of interference.)

● Chips

a) Improvement of mounting and dismounting procedures.
b) Improvement of handling method.
c) Investigation followed by countermeasures for excessively heavy load.

Examples of failures

■ Crack and chip in a Spherical Roller Bearing

(A-6395)

■ Crack on outer ring of Four-Point Contact Ball Bearing

Crack starting from key groove on O.D. surface.

(A-6625)

■ Crack in outer ring of Double-Row Cylindrical Roller Bearing

(A-6626)

● Chip in outer ring rib of Cylindrical Roller Bearing

(A-6555)

● Chip in outer ring rib of Cylindrical Roller Bearing

(A-6658)

4 Brinelling and Nicks

	Phenomena, causes and countermeasures	Examples of failures
Phenomena	■ Brinelling is depressions created on the part of the raceway surface which comes into contact with the rolling element, and is due to plastic deformation. Brinelling is also small depressions on the rolling surface caused by contamination by solid foreign matters. ● Nicks are a flaw caused by the direct impact received when bearings are hit by a hammer or other solid tool.	■ Brinelling on outer ring raceway surface of Deep Groove Ball Bearing  (A-6474) ■ Brinelling on inner ring raceway surface of Tapered Roller Bearing  (A-6617)
Causes	■ Brinelling 1） Extremely heavy load （static load, impact load） applied to bearing. 2） Solid foreign matter caught in bearing parts. ● Nicks 1） Faulty bearing mounting or dismounting. 2） Mis-handling of bearings.	
Countermeasures	■ Brinelling a） Investigation followed by countermeasures for excessively heavy load or impact. b） Enhancement of sealing capability. c） Careful washing of shaft and housing to remove foreign matter. d） Filtering of oil. e） Investigation of flaking in target bearing together with other bearings. ● Nicks a） Improvement of bearing mounting and dismounting. b） Improvement of bearing handling.	

5 Scratches and Scuffing

Phenomena, causes and countermeasures

Phenomena

■ A scratch is a relatively shallow flaw caused by sliding contact.

● Scuffing is a flaw caused by high contact pressure and heat on the rolling surface.

In general, more serious scratches are regarded as scuffing.

1) Flaw in the axial direction (flaw occurring in mounting)
   In the mounting of bearings whose outer rings and inner rings are separable, a flaw in the axial direction is sometimes caused by contact with the edge of rollers or raceway surfaces.
   These are referred to as flaws in the axial direction.

2) Scuffing on roller end face and rib face
   Cycloidal flaws can occur on the roller end or rib face of the bearing ring, which guides rollers.
   Flaws such as scratches, which occur on these parts are called scuffing.

Causes

(1) Flaw generated during mounting.
  1) Careless handling in mounting or dismounting.

(2) Scuffing on roller end face and rib face.
  1) Improper lubrication at contact face.
  2) Excessive preload.
  3) Intrusion of foreign matter.
  4) Abnormal axial load.

(3) Scratches and scuffing on raceway surface and rolling surface.
  1) Improper rotation of rolling element.
  2) Improper lubrication.
  3) Intrusion of foreign matter.

Countermeasures

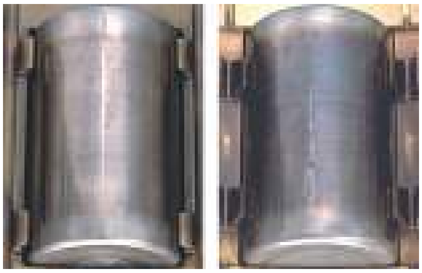
(1) Flaw generated during mounting.
  a) Improvement in operations involved in mounting and dismounting.
     (Implementation of accurate center adjustment.)

(2) Scuffing on roller end face and rib face.
  a) Review and improvement of lubricant and lubrication method.
  b) Inspection and countermeasures for abnormal load.
  c) Enhancement of sealing capability.

(3) Scratches and scuffing on raceway surface and rolling surface.
  a) Review and improvement of lubricant and lubrication method.
  b) Enhancement of sealing capability.
  c) Sufficient cleaning of shaft and housing.

Examples of failures

■ Scratch on roller rolling surface of Cylindrical Roller Bearing



(A-6451, 6453)

■ Scratch on roller rolling surface of Cylindrical Roller Bearing

Scratch occurring in circumference direction.

(A-6452)

■ Scratch on outer ring raceway surface of Double-Row Cylindrical Roller Bearing

Roller which slides when running.

(A-6470)

● Scuffing on inner ring bore surface of Tapered Roller Bearing

(A-6736)

● Scuffing on inner ring rib face and roller and face of Cylindrical Roller Bearing with rib

(A-6669)

6 Rust and Corrosion

Phenomena, causes and countermeasures

Phenomena

■ Rust is a film of oxide, hydroxide, or carbonate produced on a metallic surface by chemical action.

● Corrosion is the phenomena of oxidation or dissolution occurring on the surface and is produced by chemical action (electric chemical action including combination or cell restructuring) with acid or alkali.

Causes

■ Rust

1) When equipment is stopped and its temperature decreases to the dew point, humidity in the housing turns into drops of water. The water drops often contaminate the lubricant. As a result, rust is generated on the bearing surface.

2) When bearings are stored in a humid place for a long time, rust is generated on the raceway surface at intervals equal to the rolling elements spacing.

● Corrosion

1) Corrosion occurs when a sulfur or chlorine compound contained in lubricant additives decomposes under high temperature.

2) Corrosion occurs when water gets inside bearings.

Countermeasures

■ Rust ● Corrosion

a) Enhancement of sealing capability.

b) Periodic inspection of lubricant.

c) Provision for adequate rust prevention during storage of bearings.

Examples of failures

■ **Rust on outer ring raceway surface of Double-Row Angular Ball Bearing**

Rust on raceway surface of one row.

(A-6494)

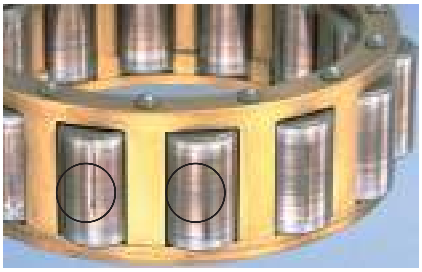
■ **Rust on outer ring raceway surface of Double-Row Cylindrical Roller Bearing**

Rust on roller pitch.

(A-6472)

■ **Rust on roller rolling surface of Cylindrical Roller Bearing**

Rust at one position the rollers.



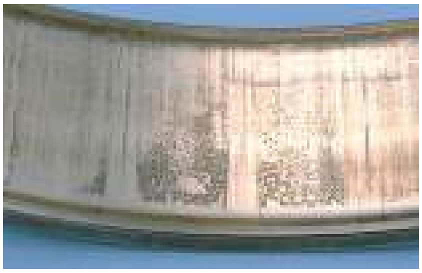
(A-6479)

■ **Rust on inner and outer rings and on roller of Tapered Roller Bearing**

Rust on roller pitch of one row.

(A-7130)

■ **Rust on outer ring raceway surface of Tapered Roller Bearing**



(A-7051)

7 Pear skin, Discoloration

Phenomena, causes and countermeasures

Phenomena

■ Pear skin is a condition of the rolling surface where small depressions are created entirely as a result of many foreign matters being caught between parts.

A rolling surface suffering from pear skin appears dim and is rough in texture. In the worst case, the surface is discolored by heat.

● Discoloration is a phenomena in which the bearing surface is discolored by staining or heat generated during operation.

Causes

■ Pear skin

Since pear skin is mainly caused by contamination by foreign matter or lack of lubricant, these two points should be inspected most carefully.

● Discoloration

1) Discoloration (staining) is caused by deterioration of the lubricant or adhesion of colored substances to the bearing surface.
Some of these substances can be removed by scrubbing or wiping with a solvent.

2) A brown discoloration of the rolling or sliding surface is caused by adhesion of acidic powders generated by abrasion during operation.
In general, these powders adhere uniformly to the bearing circumference.

Countermeasures

■ Pear skin

a) Careful washing of shaft and housing.
b) Enhancement of sealing capability.
c) Filtering of oil.
d) Review of lubricant and lubrication method.

● Discoloration

Discoloration can be classified as follows: staining, electric pitting, rust, corrosion, and temper color. Stains can be removed by wiping with an organic solvent (aceton). When observed by microscope, electric pitting is small depressions caused by electric discharge. If unevenness remains on the surface after wiping with sand paper, the phenomena are judged to be rust and corrosion. If unevenness is completely removed, the phenomena is judged to be temper color caused by heat.

a) Improvement of heat dissipation from bearings.
b) Improvement of lubrication.
c) Review followed by countermeasures for bearing operating conditions.

Examples of failures

■ Pear skin on inner ring raceway surface of Double-Row Cylindrical Roller Bearing

(A-6556)

■ Pear skin on inner ring raceway surface of Deep Groove Ball Bearing

(A-6960)

● Discoloration on ball surface of Deep Groove Ball Bearing

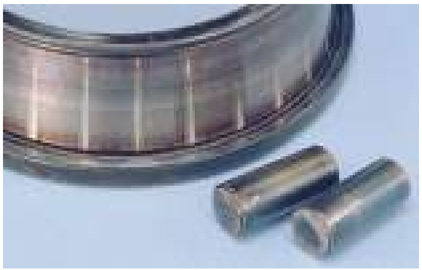
(A-6639)

● Discoloration on raceway surface, roller rolling surface of Cylindrical Roller Bearing

(A-6725)

● Discoloration on inner ring and roller of Tapered Roller Bearing

Staining



(A-6982)

Ⅲ. Failures, Causes and Countermeasures

8 Smearing

	Phenomena, causes and countermeasures
Phenomena	■ Smearing is a phenomena where minute seizure is concentrated on the rolling surface. In smearing, the surface is partially melted by heat of high temperature generated by friction; and on some parts, the surface damaged becomes significantly rough.
Causes	1) Smearing occurs if the oil film disappears as rolling elements stop rotating due to inappropriate use or improper lubrication, and then start to slide on the raceway surface. 2) In ball bearings, smearing is caused by sliding or spinning of balls; and, in roller bearings, smearing tends to occur when the roller enters into on from the load zone.
Countermeasures	a) Review followed by countermeasures to improve the formation of oil film. b) Provision for extreme-pressure lubricant. c) Adoption of countermeasures to prevent sliding. (by diminishing mounting clearance.)

Examples of failures

■ Smearing on inner ring raceway surface of Deep Groove Ball Bearing

(A-6640)

■ Smearing on ball surface

(A-6641)

■ Smearing on inner ring raceway surface of Angular Ball Bearing

(A-6642)

■ Smearing on outer ring raceway surface of Cylindrical Roller Bearing

(A-7435)

■ Smearing on roller rolling surface of Cylindrical Roller Bearing

(A-6480)

9 Creep

	Phenomena, causes and countermeasures	Examples of failures
Phenomena	■ Creep is the displacement during operation of a bearing ring, relative to the shaft or housing.	■ Creep of Deep Groove Ball Bearing inner ring  (A-6726) ■ Creep of Deep Groove Ball Bearing outer ring  (A-6957) ■ Creep of Double-Row Cylindrical Roller Bearing inner ring  (A-6647) ■ Creep of Tapered Roller Bearing inner ring  (A-6616)
Causes	Creep occurs when interference is too small in relation to the heat or load generated during operation.	
Countermeasures	Review of interference between inner ring and shaft and between outer ring and housing.（Increase of interference.）	

10 Electric pitting

	Phenomena, causes and countermeasures	Examples of failures
Phenomena	■ Electric pitting is a phenomena in which the bearing surface is partially melted by sparks generated when electric current enters the bearing and passes through an extremely thin oil film at the rolling contact point. Electric pitting can be classified into pitting or ridge marks, which the rolling contact surface propagates. Depressions like craters can be observed when pitting is magnified, indicating that the surface has been melted by sparks. ・Significant electric pitting causes flaking. In addition, since the hardness of the rolling contact surface deteriorates, the surface tends to be easily worn. ・If a fluting surface is found by manual inspection, or pitting is observed by normal visual inspection, the bearing cannot be re-used.	■ Electric pitting on Deep Groove Ball Bearing Fluting on inner ring raceway surface.  (A-6652) ■ Electric pitting on Cylindrical Roller Bearing  (A-6653) ■ Electric pitting on Cylindrical Roller Bearing inner ring  (A-5180) ■ Fluting on Cylindrical Roller Bearing inner ring  (A-6651) ■ Fluting on Spherical Roller Rolling surface  (A-6409, 6650)
Causes	Bearing surface is partially melted by electric current passing through the bearing.	
Countermeasures	a) Improvement of grounding or improvement of grounding maintenance. b) Provision of insulation for bearings or for the section near bearings.	

11 Seizure

Phenomena, causes and countermeasures

Phenomena

- Although scuffing and smearing can be categorized as seizure, scuffing is generally regarded as a more serious type of failure. The seizure described in this section is the kind in which bearing parts are melted and adhere to one another due to abnormal heat or the rolling surface becoming rough; as a result, the bearing can no longer rotate.

· Once seizure occurs, the bearing cannot be used again because the hardness has deteriorated and smooth rotation is impossible on the rough surface.

Causes

Seizure results from abnormal heat generated by improper lubrication, excessive preload, or improper contact of rolling elements with the raceway surface, which cannot be compensated for by the cooling method or lubrication employed in the bearings.

Countermeasures

Causes should be investigated; and appropriate countermeasures corresponding to the results should be taken.

Examples of failures

■ Seizure of Cylindrical Roller Bearing

Rollers are removed because pocket surface of cage has become worn.

(A-6457)

■ Seizure of Cylindrical Roller Bearing with rib

(A-6464)

■ Seizure of Tapered Roller Bearing

Heat is generated on roller end face and inner ring rib face.

(A-6679)

12 Failure of Cage

Phenomena, causes and countermeasures

Phenomena

1) Cracks and Chips
If a seriously cracked bearing is used under heavy operating conditions, it will fail.

2) Flaw and Distortion
- Since cages are made from soft material, they tend to be damaged or become distorted by external forces or from contact with other parts.
- Since cages with a serious flaw also have distortion, their accuracy may decrease.
And the motion of the rolling element is consequently affected; therefore, especially the size and location of the flaw should be checked with care.

3) Rust and Corrosion
If rust or corrosion is found on cages, it can be assumed that it is also occurring on the bearing ring and rolling element.

4) Wear
As described in Section 2, cages under the following conditions can no longer be used because proper rotation of the rolling element is hindered: cages whose pocket surface has been worn down in the shape of the rolling elements; cages which cannot maintain the rolling elements, and cages whose guide surface for the bearing ring has been eccentrically or severely worn.

5) Looseness and Improper Riveting
Looseness of the rivet is caused by an error in bearing mounting, moment load, variable load, vibration, etc.
If a bearing is operated with improper riveting, the bearing cannot be returned to service because the rivets may break.

Causes and countermeasures

1) Cracks and Chips
   a) Careless handling.
   b) Abnormal load, Vibration impact.
2) Flaw, Distortion
   a) Careless handling.
3) Rust, Corrosion
   a) Improvement of sealing capability.
      Periodic inspection of lubricant.
   b) Provision of adequate rust prevention during storage of bearings
4) Wear
   a) Improper lubricant or shortage of lubricant ... Investigation followed by countermeasures involving lubricant and lubrication method.
   b) Contamination by foreign matter ... Improvement of sealing capability.
5) Looseness and Cut-Off of Rivet
   a) Improper bearing mounting ... Reduction of bearing inclination.
   b) Severe load or vibration ... Consultation with Koyo.

Examples of failures

● Crack of Deep Groove Ball Bearing cage

(A-6455)

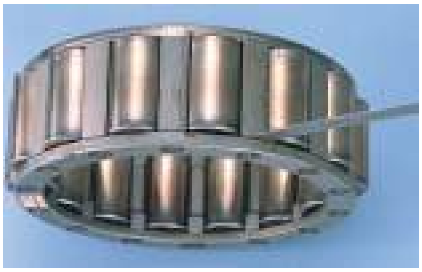
● Crack of Tapered Roller Bearing cage

(A-6670)

● Distortion of Cylindrical Roller Bearing cage

(A-7026)

● Looseness of Cylindrical Roller Bearing cage rivet



(A-6481)

● Rust on Tapered Roller bearing cage

(A-7131)

High speed ball bearing for EV motors

Supports "high temperature" and "high speed" required for EV motors

Features

① Adoption of JTEKT's original shape cage with excellent high speed Supports $d_{m}n$(※) 1.5 million

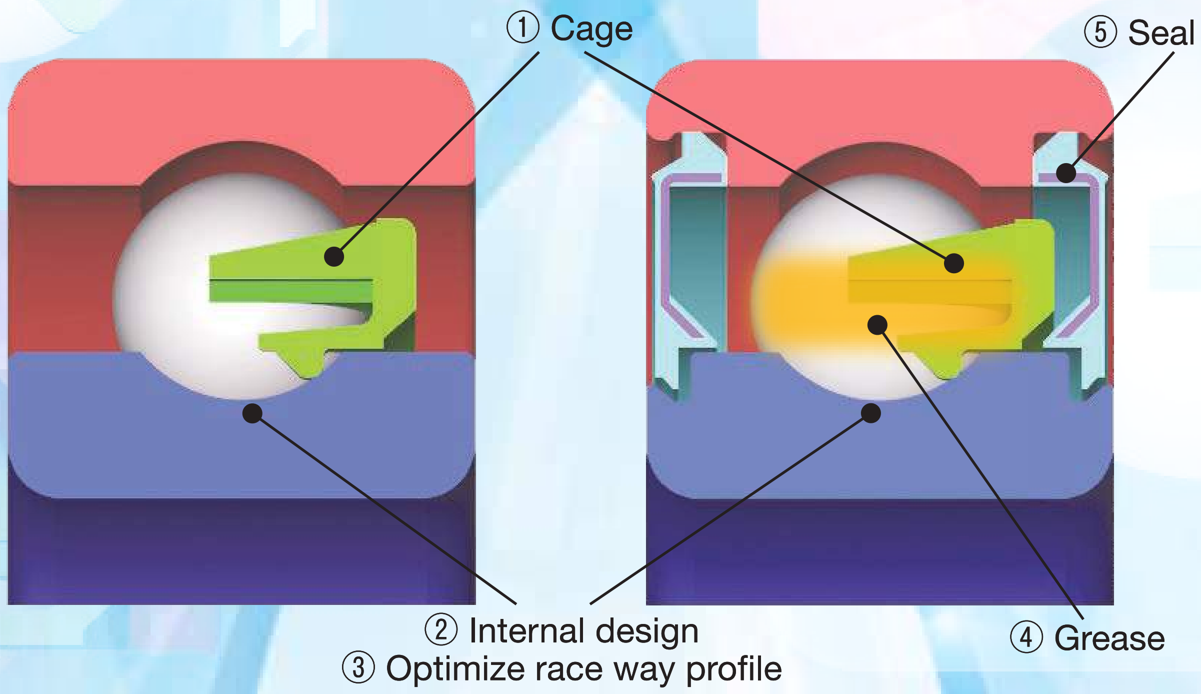
② Internal design with excellent high temperature and high speed

③ Improvement of quietness by optimizing the raceway surface properties and improving accuracy

④ Adoption of JTEKT's original grease that supports high temperature and high speed

⑤ Lineup of open type and sealed type according to the usage environment

(※) $d_{m}n$: A value that expresses the rotational performance of a bearing
Pitch circle diameter (mm) x rotation speed (min^{-1})



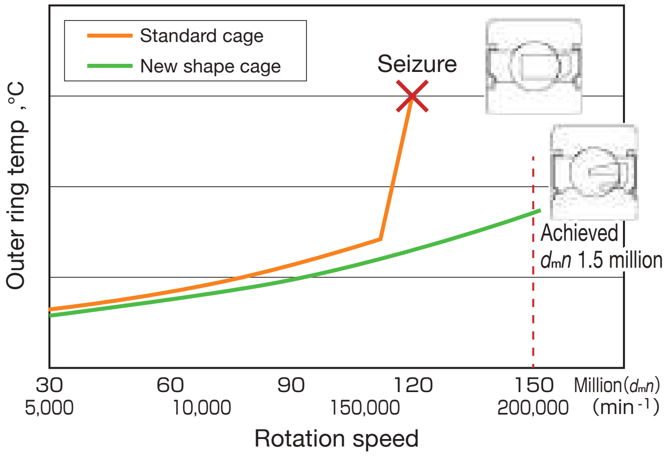
Open Type **Sealed Type**

CAT.NO.BA019EN-0MY

Performance

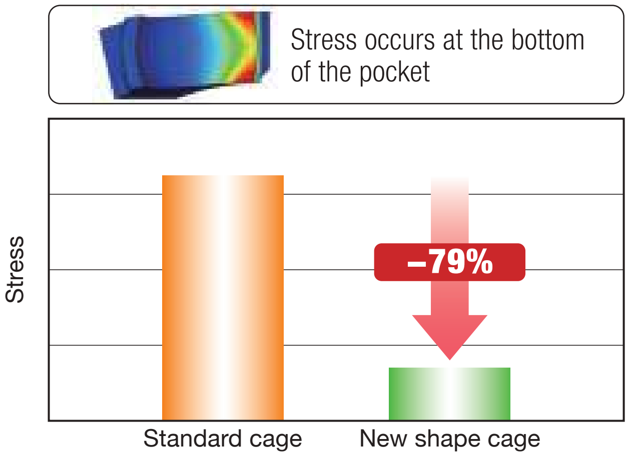
Temperature rise suppression

Reduced temperature rise under high speed rotation by optimizing the internal design



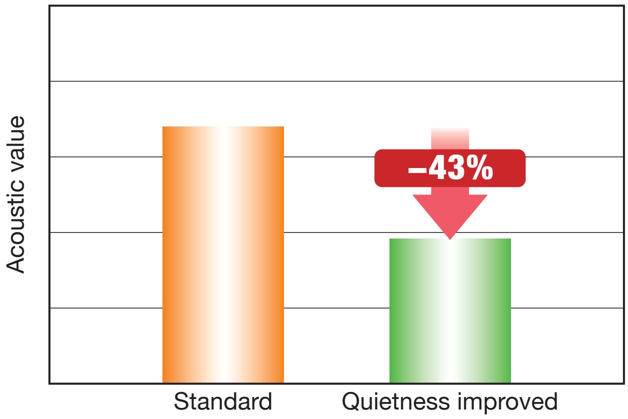
Cage strength

Significantly reduces the stress generated by centrifugal force



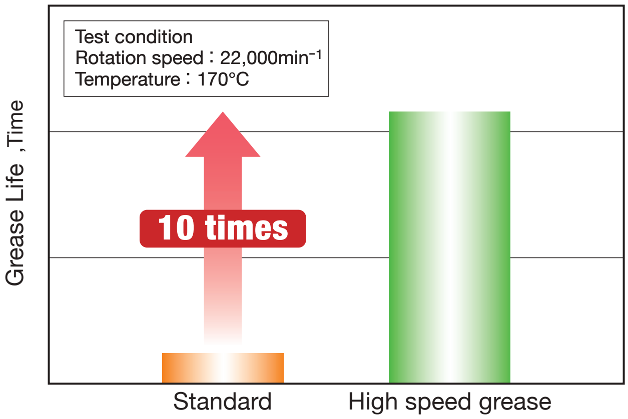
Silence

Reduced acoustic level by the raceway surface properties and accuracy



High temperature and high speed grease

Improved life at high temperature and high speed compared to standard grease



Bearing lineup for high-speed EV

Basic Model number	Boundary dimensions (mm)			Basic load rating (kN)		Limiting speeds (min^{-1})
	d	*D*	*B*	C_r	C_{0r}	
6007	35	62	14	15.9	10.3	30,000
6008	40	68	15	16.7	11.5	27,000

※ Please contact JTEKT as the internal clearance of the bearing is important when using it in other sizes or at high speed rotation.
