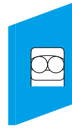
Self-Aligning Ball Bearings



1. Design features and characteristics

The outer ring raceway of self-aligning ball bearings forms a spherical surface whose center is common to the bearing center. The inner ring of the bearing has two raceways.

The balls, cage, and inner ring of these bearings are capable of shifting in order to compensate for a certain degree of misalignment with the outer rings. As a result, the bearing is able to align itself and compensate for shaft / housing finishing unevenness, bearing fitting error, and other sources of misalignment as shown in **Fig. 1**.

Since axial load capacity is limited, self-aligning ball bearing are not suitable for applications with heavy axial loads.

It is recommended to use an adapter on a self-aligning ball bearing with a tapered bore inner diameter for ease of installation and disassembly. These bearings and adapters are often used on drive shaft applications.

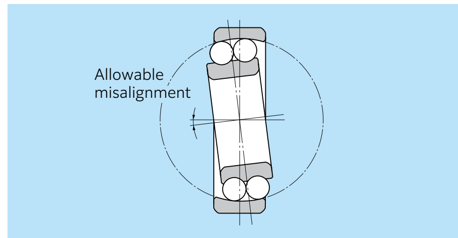


Fig. 1

2. Standard cage type

All bearing series are equipped with a pressed cage, except 2321S and 2322S, which are equipped with a machined cage.

Table 1 Standard cage types of spherical ball bearings

	Pressed steel cage		Machined cage
Cage type			Bearing series or model	12 and 13 series	22 and 23 series	2321S , 2322S

3. Ball protrusion

Bearings with part numbers listed in **Table 2** below have balls which protrude slightly from the bearing face as illustrated in **Fig. 2**. The total width dimensions are shown in **Table 2**.

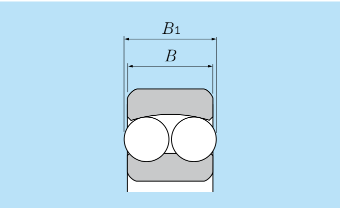

Fig. 2

Table 2

Unit: mm

Bearing numbers	Width dimension B	Total width dimension B_1
2222S (K)	53	54
2316S (K)	58	59
2319S (K)	67	68
2320S (K)	73	74
2321S	77	78
2322S (K)	80	81
1318S (K)	43	46
1319S (K)	45	49
1320S (K)	47	53
1321S	49	55
1322S (K)	50	56

4. Allowable misalignment angle

The allowable misalignment angle can be determined by the following function. This degree of allowable misalignment may be limited by the design of mating components around the bearing.

Normal load ······················ 1/15

5. Precautions for using self-aligning ball bearings

Self-aligning ball bearings are unable to support large axial loads and therefore axial loading shall be limited.

Please consider using self-aligning roller bearings when a large axial load is to be applied.

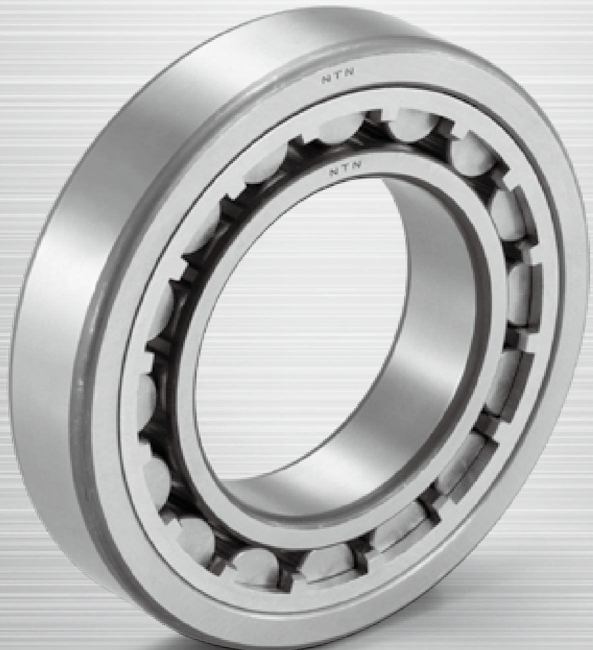
Cylindrical Roller Bearings



Cylindrical roller bearing

E Type cylindrical roller bearing

Double-row cylindrical roller bearing

1. Types, design features, and characteristics

Cylindrical roller bearings can accommodate heavy radial loads due to the line contact formed between their rolling elements and raceways. These bearings are also suitable for high speed applications since the rollers are guided by either inner or outer ring ribs. Cylindrical roller bearings are separable, allowing them to be easily installed and disassembled even when interference fits are required.

Among the various types of cylindrical roller bearings, E type and EA type have a high load capacity while maintaining standard boundary dimensions. HT type has a large axial load capacity, and HL type provides extended fatigue life in poor lubrication conditions. Multiple row bearing arrangements are also available.

For extremely heavy load applications, the non-separable full complement SL type bearing offers special advantages. For SL type and four-row cylindrical roller bearings, see section "C. Special application bearings."

Table 1 shows the various types and characteristics of single row cylindrical roller bearings. **Table 2** shows the characteristics of non-standard type cylindrical roller bearings.

Table 1 Cylindrical roller bearing types and characteristics

Type code	Design	Characteristics
NU type N type	 NU type  N type	● NU type outer rings have two ribs. The outer ring, roller, and cage assembly can be separated from the inner ring. N type inner rings have two ribs. The inner ring, roller, and cage assembly can be separated from the outer ring. ● Unable to accommodate any axial loading. ● This is widely used as the floating side bearing in a fixed-float arrangement.
NJ type NF type	 NJ type  NF type	● NJ type has two ribs on the outer ring, a single rib on the inner ring; NF type has a single rib on the outer ring, and two ribs on the inner ring. ● Can receive single direction axial loads. ● When there is no distinction between the fixed side and floating side bearing, these types can be used as a pair in close proximity.
NUP type NH type (NJ+HJ)	 NUP type  NH type	● NUP type has a collar ring attached to the ribless side of the inner ring; NH type is NJ type with an L type collar ring attached. All of these collar rings are separable, and therefore it is necessary to fix the inner ring axially. ● Can accommodate axial loads in either direction. ● Widely used as the shaft's fixed-side bearing.

Table 2 Non-standard type cylindrical roller bearing characteristics

Designation	Characteristics
E type and EA type Cylindrical roller bearing	● Boundary dimensions are the same as the standard type, but the diameter, length and number of the rollers have been increased, resulting in higher load capacity. ● Identified by the addition of "E" to the end of the basic roller number. ● Enables compact design due increased load rating. ● Rollers' inscribed circle diameter differs from the standard type rollers and therefore cannot be interchanged. ● EA type bearings are ULTAGE series[1).  Note: In the dimension tables, both E type and EA type are listed.
Cylindrical roller bearing for axial loads (HT type)	● Can accommodate larger axial loads than the standard type due to improved geometry of the rib roller end surface. ● Please consult **NTN** Engineering concerning necessary considerations, such as load, lubricant, and installation conditions.
Double-row cylindrical roller bearing	● NN type and NNU type are available. ● Widely used for applications requiring thin-walled bearings, such the main shafts of machine tools, rolling machine rollers, and in printing equipment. ● Internal radial clearance is adjusted for the spindle of machine tools by pressing the tapered bore of the inner ring on a tapered shaft. Remarks: For precision bearings for machine tools, see **precision rolling bearings (CAT. No. 2260/E)**.

1) **ULTAGE series cylindrical roller bearings** has been developed for "longer life," "improved loading capability," and "higher speed," which are required for various types of industrial machinery. For details, see **the special catalog (CAT. No. 3037/E)**.

Cylindrical Roller Bearings NTN

2. Standard cage type

Table 3 shows the standard cage types for cylindrical roller bearings.

The basic load ratings listed in the dimension charts correspond to use of the standard cages listed in **Table 3**. The basic load ratings listed in the dimension tables are for standard configurations. These ratings can change when a different cage type and number of rolling elements is utilized.

Table 3 Standard cage types

Cage type / Bearing series	Resin cage	Pressed cage	Machined cage	
			Single type	Studded double type
				
NU10	—	—	—	1005 to 10/500
NU2 NU2E NU2EA	— — 204EA to 219EA	208 to 230 — —	232 to 240 220E to 240E —	244 to 264 — —
NU22 NU22E NU22EA	— — 2204EA to 2218EA	2208 to 2230 — —	2232 to 2240 2219E to 2240E —	2244 to 2264 — —
NU3 NU3E NU3EA	— — 304EA to 315EA	308 to 324 — —	326 to 330 316E to 332E —	332 to 356 — —
NU23 NU23E NU23EA	— — 2304EA to 2315EA	2308 to 2320 — —	2322 to 2330 2316E to 2332E —	2332 to 2356 — —
NU4	—	405 to 416	—	—

Note: 1. Within the same bearing series, cage type is constant regardless of the cylindrical roller bearing type (NJ, NUP, N, NF).
2. For high speed and other special applications, machined cages can be manufactured when necessary. Consult **NTN** Engineering.
3. Among EA type bearings that use resin cages as standard, certain varieties use pressed cages. Consult **NTN** Engineering.
4. Although machined cages are the standard for two-row cylindrical roller bearings, resin cages may also be used in some of these bearings for machine tool applications.

3. Allowable misalignment

Edge loading due to misalignment under general load conditions should be avoided to prevent premature bearing failure, The maximum allowable misalignment based on bearing series can be found below. The values apply when the bearings are to be used as the floating side of NU and N types. For NJ, NUP, and NH types that are to be used for the fixed side, consult **NTN** Engineering. Depending on the magnitude of the axial load, the edge loading may exceed recommended limits, which could lead to a reduction in bearing life.

- Bearing series 0 or 1 ··············· 1/1 000
- Bearing series 2 ························ 1/2 000
- Bearing series 0, 1, and 2 single-row ULTAGE ·· 1/500
- Double-row cylindrical roller bearings[1)] ·· 1/2 000

1) Does not include high precision bearings for machine tool main shaft applications.

4. Combinations of cylindrical roller bearings

Table 4 shows the representative combinations of bearings.

Table 4 Combination type

Back-to-back arrangement (DB)	Face-to-face arrangement (DF)	Symmetrical parts arrangement (D2)
 NJ type	 NJ type	 NU type
 NF type	 NF type	 N type

Note: 1. Bearings are manufactured in a set so that two bearings receive a load evenly; therefore, they must be assembled together with identically numbered bearings and not mixed with other arrangements.
2. Triplex arrangements of bearings are also available. Consult **NTN** Engineering for details.

5. Tolerance of inscribed circle diameter and circumscribed circle diameter of rollers of interchangeable cylindrical roller bearings

Table 5 Tolerance of inscribed circle diameter and circumscribed circle diameter of rollers of interchangeable cylindrical roller bearings

Unit: μm

Nominal bore diameter d (mm)		Dimensional tolerance of roller inscribed circle diameter Δ_{Fw}		Dimensional tolerance of roller circumscribed circle diameter Δ_{Ew}	
Over	Incl.	Upper	Lower	Upper	Lower
17[1)]	20	+10	0	0	−10
20	50	+15	0	0	−15
50	120	+20	0	0	−20
120	200	+25	0	0	−25
200	250	+30	0	0	−30
250	315	+35	0	0	−35
315	400	+40	0	0	−40
400	500	+45	0	0	−45

1) 17 mm is included in this dimensional division.
Note: Interchangeable cylindrical roller bearings are bearings having the same number in the group. The bearing function is not impaired even if an outer ring is combined with an inner ring with rollers or an inner ring is combined with an outer ring with rollers.

6. Allowable speed of cylindrical roller bearing ULTAGE series

As the rotational speed of the bearing increases, the temperature of the bearing also increases because of the friction heat produced inside the bearing. Operation at excessive temperatures will significantly deteriorate the lubricant performance, causing abnormal temperature rises and seizure. Factors affecting the allowable speed of bearings are as follows.

(1) Bearing type
(2) Bearing size
(3) Lubrication (grease lubrication, circulating lubrication, oil lubrication, etc.)
(4) Bearing internal clearance (bearing internal clearance during operation)
(5) Bearing load
(6) Shaft and housing accuracy

The allowable speed specified in the bearing dimension table is the reference speed limit which allows for satisfactory heat dissipation and lubrication conditions before adversely affecting the bearing. The allowable speed of ULTAGE series cylindrical roller bearings specified in the catalog is defined as follows.

[Oil lubrication]
The allowable speed for oil lubrication is the speed at which the outer ring temperature reaches 80°C with room temperature spindle oil (lubrication oil viscosity: VG32) supplied at 1 liter/min under an operating load of 5% of the basic static load rating C_{0r}.

[Grease lubrication]
The allowable speed for grease lubrication is the speed at which the outer ring temperature reaches 80°C with lithium-based grease (consistency: NLGI3) filled 20%-30% of the free space under an operating load of 5% of the basic static load rating C_{0r}.

In either of the lubrication methods, the bearing temperature rise differs if the usage condition (operating load, rotational speed pattern, lubricating condition, etc.) is different; therefore, the bearings must be selected with sufficient allowable speed as specified in the catalog.

If 80% of the allowable speed specified in the dimension table is exceeded or the bearing is used under vibration or impact conditions, please consult **NTN** Engineering.

See section "9. Allowable speed" for the definition of the allowable speed of the cylindrical roller bearings that are not part of the ULTAGE series.

1) Smallest allowable dimension for chamfer dimension r. Note: 1 This L type collar ring is used with NU type cylindrical roller bearings; in duplex arrangements with NJ or NU type bearing numbers, they become NH type and NUJ type respectively. Refer to pages B-98 to B-101 for bearing dimensions, allowable rotations, and mass. 2. "∗" indicates L type collar rings that can also be used with dimension series 22 bearings.

Tapered Roller Bearings

Single row tapered roller bearing

Double row tapered roller bearing

1. Types, design features, and characteristics

Tapered roller bearings are designed so the tapered vertex of the raceway surfaces of the inner and outer rings and rollers converge at one point on the centerline of the bearing (see **Fig. 1**).

The tapered rollers are guided by the compound force of the inner and outer raceway surfaces which keep the rollers pressed up against the large rib on the inner ring.

A large variety of these bearings, including single, double, and four row arrangements, are available in both metric and inch series. Each type and associated characteristics are shown in **Table 1**. For four-row tapered roller bearings, see section "C. Special application bearings."

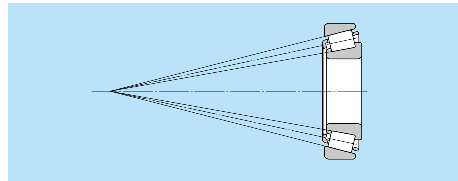

Fig. 1

Table 1 Tapered roller bearing types and characteristics

<table>
<tr><th>Type</th><th>Characteristics</th></tr>
<tr><td>Single row tapered roller bearings</td><td>
(1) There are both metric and inch series adhering to the standards shown in the following table.
Dimension series
<table>
<tr><th></th><th>Metric series</th><th>Inch series</th></tr>
<tr><td>Standard</td><td>●JIS B 1534
●JIS B 1512
●ISO 355</td><td>●ABMA
(includes metric J-series)</td></tr>
<tr><td>Basic number</td><td>Example, 30210
*T2EE040</td><td>Inner ring no. / outer ring no.
("J" appears at the beginning of the basic number in the case of J-series.)</td></tr>
</table>
*Dimension series previously not covered by 3XX are regulated under JIS B 1512; dimensions previously missing from 3XX will henceforth use the bearing number.
(2) In addition to the standard design, there are also medium contact angle and large contact angle types, denoted by the contact angle codes at the end of the part numbers (C and D, respectively).
(3) Subunits
Tapered roller bearings can be disassembled into parts: the inner ring, rollers, and cage (collectively known as the "CONE") and the outer ring (known as the "CUP"). These are the bearing's "subunits". Subunit dimensions are standardized under ISO or ABMA standards, and unified subunits are interchangeable within each dimensional standard. However, high precision grade bearings are generally not interchangeable, and these subunits must be used by assembling only subunits with identical manufacturing numbers.
Aside from any cautionary notes that may appear, the single row tapered roller bearings listed in the dimension tables have subunits standardized for both metric and inch systems (including J series). (Refer to Fig. 2)

Table 1 (continued)

Type	Characteristics	
Single row tapered roller bearings	(4) These bearings are constructed to have a high capacity for radial loads, axial loads, and combined loads. The larger the contact angle, the greater the axial load capacity. When a pure radial load is applied to a tapered roller bearing, an induced load in the axial direction is also generated, so these bearings are generally used in pairs. (5) Single row tapered roller bearings are separable, so both the inner and outer rings can be used with tight fits. (6) Tapered roller bearings are also manufactured with flanges attached to the outer rings. For more details, contact **NTN** Engineering. (Refer to **Fig. 3**)	 **Fig. 3**
Duplex tapered roller bearings	(1) When two single-row tapered roller bearings are to be used in combination, the bearing clearance and preload are adjusted by the inner ring spacer or the outer ring spacer (see **Fig. 4**). (2) A product number and a combination code are indicated on inner rings, outer rings, and spacers. Parts displaying the same number and code must be used in combination. (3) See A-96 **Table 8.14** for the axial internal clearance.	 Back-to-back (DB) Face-to-face (DF) **Fig. 4**
Double row tapered roller bearings	(1) Back-to-back arrangement (using double row outer rings) and face-to-face arrangement (using double row inner rings) are both available. The assemblies have been adjusted so that each type's internal clearance values are fixed. Only parts with identical manufacturing numbers can be used and they must be assembled according to their code numbers. (Refer to **Fig. 5**) (2) See A-96 **Table 8.14** for the axial internal clearance of double-row and duplex bearings.	 Face-to-face Back-to-back **Fig. 5**

2. Standard cage type

In general, pressed cages (see **Fig. 6**) are used in tapered roller bearings. For large sized bearings, machined or pin type cages may also be used, while resin cages may also be used for smaller sized bearings.

Fig. 6 Pressed steel cage

3. Allowable misalignment

In order to avoid edge loading and potential for premature failure, the maximum allowable misalignment based on bearing series can be found below.

The allowable misalignment of combined bearings is influenced by the load center position, so please consult **NTN** Engineering.

- Single row (standard) ··············· 1/ 2 000
- Single row (ULTAGE) ··············· 1/ 600

4. Precautions

If bearing load is light during operation, or if the ratio of axial to radial load for duplex and double row bearings exceeds the value of e, slipping may develop between the rollers and raceway surface, sometimes resulting in smearing. The mass of rollers and cages particularly tends to be large for large tapered roller bearings. For additional details, please contact **NTN** Engineering.

In tapered roller bearings, the cage may protrude beyond the inner and/or outer ring side faces. Care should be taken when designing the housing and shaft to ensure contact with the cage does not occur.

5. Tapered roller bearing (ULTAGE) series

The ULTAGE tapered roller bearings have been developed for "long operating life," "improved load capacity," and "higher speed" required for various types of industrial machinery.

For details, see the **special catalog (CAT. No. 3035/E)**.

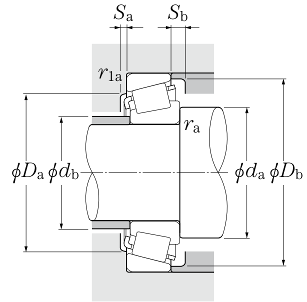
1) Smallest allowable dimension for chamfer dimension r or r_1.
2) Bearings with a ○ mark do not incorporate the subunit dimensions.



Dynamic equivalent radial load
$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \leqq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	Y_2

Static equivalent radial load
$P_{0r} = 0.5F_r + Y_0F_a$
When $P_{0r} < F_r$ use $P_{0r} = F_r$.
For values of e, Y_2 and Y_0 see the table below.

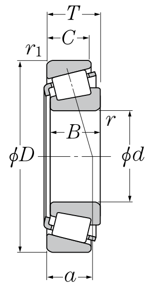
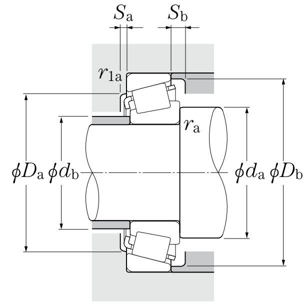
1) Smallest allowable dimension for chamfer dimension r or r_1.
2) Bearings with a ○ mark do not incorporate the subunit dimensions.

Metric series





Dynamic equivalent radial load
$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \leqq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	Y_2

Static equivalent radial load
$P_{0r} = 0.5F_r + Y_0F_a$
When $P_{0r} < F_r$ use $P_{0r} = F_r$.
For values of e, Y_2 and Y_0 see the table below.

1) Smallest allowable dimension for chamfer dimension r or r_1.
2) Bearings with a ○ mark do not incorporate the subunit dimensions.

Dynamic equivalent radial load
$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \leqq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	Y_2

Static equivalent radial load
$P_{0r} = 0.5F_r + Y_0F_a$
When $P_{0r} < F_r$ use $P_{0r} = F_r$.
For values of e, Y_2 and Y_0 see the table below.

ISO Dimension series	d_a Min.	d_b Max.	D_a Max.	D_a Min.	D_b Min.	S_a Min.	S_b Min.	r_{as} Max.	r_{1as} Max.	a	e	Y_2	Y_0	Mass kg (approx.)

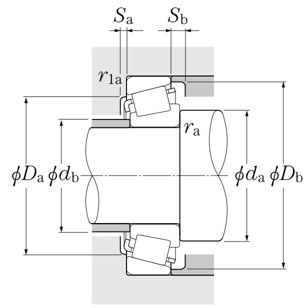
1) Smallest allowable dimension for chamfer dimension r or r_1.



Dynamic equivalent radial load
$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	Y_2

Static equivalent radial load
$P_{0r} = 0.5F_r + Y_0F_a$
When $P_{0r} < F_r$ use $P_{0r} = F_r$.
For values of e, Y_2 and Y_0 see the table below.

Bearing number	ISO Dimension series	d_a Min. (mm)	d_b Max. (mm)	D_a Max. (mm)	D_a Min. (mm)	D_b Min. (mm)	S_a Min. (mm)	S_b Min. (mm)	r_{as} Max. (mm)	r_{1as} Max. (mm)	Load center a (mm)	Constant e	Axial load factors Y_2	Axial load factors Y_0	Mass kg (approx.)

Note: Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than the maximum values of installation-related dimensions r_{as} and r_{1as}.
1) As for the maximum value for inner ring bore diameters of bearings whose bearing numbers are marked with "†" (inner ring), the precision class is an integer for class 4 and class 2 bearings only.

2) Bearing numbers marked "#" designate J-series bearings. The tolerance of these bearings is listed in Table 6.8 on page A-66 to A-67.
3) Chamfer dimensions of the bearings marked "∗" are shown in the above drawings.

Note: Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than the maximum values of installation-related dimensions r_{as} and r_{1as}.
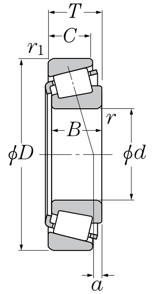
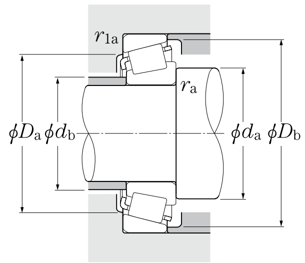
1) As for the maximum value for inner and outer ring diameters of bearings whose bearing numbers are marked with "†" (inner ring) and "††" (outer ring), the precision class is an integer for class 4 and class 2 bearings only.

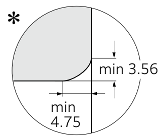
2) Bearing numbers marked "#" designate **J-series** bearings. The tolerance of these bearings is listed in **Table 6.8** on page **A-66 to A-67**.
3) Chamfer dimensions of the bearings marked "*" are shown in the above drawings.
4) Dimensions with "−" indicate a load center at the outside on the end of an inner ring.

Inch series



d 38.100 ～ 41.275mm





Dynamic equivalent radial load
$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \leqq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	Y_2

Static equivalent radial load
$P_{0r} = 0.5F_r + Y_0F_a$
When $P_{0r} < F_r$ use $P_{0r} = F_r$.
For values of e,
Y_2 and Y_0 see the table below.

Note: Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than the maximum values of installation-related dimensions r_{as} and r_{1as}.
1) As for the maximum value for inner ring bore diameters of bearings whose bearing numbers are marked with "†" (inner ring), the precision class is an integer for class 4 and class 2 bearings only.
2) Bearing numbers marked "#" designate **J-series** bearings. The tolerance of these bearings is listed in **Table 6.8** on page **A-66** to **A-67**.
3) Dimensions with "–" indicate a load center at the outside on the end of an inner ring.

2) Bearing numbers marked "#" designate **J-series** bearings. The tolerance of these bearings is listed in **Table 6.8** on page **A-66** to **A-67**.
3) Dimensions with "−" indicate a load center at the outside on the end of an inner ring.

Inch series
J series

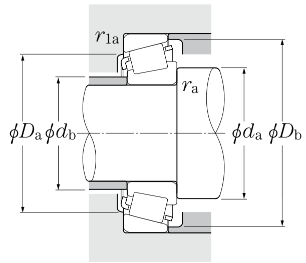
Tapered Roller Bearings NTN



Dynamic equivalent radial load
$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	Y_2

Static equivalent radial load
$P_{0r} = 0.5F_r + Y_0F_a$
When $P_{0r} < F_r$ use $P_{0r} = F_r$.
For values of e, Y_2 and Y_0 see the table below.

Note: Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than the maximum values of installation-related dimensions r_{as} and r_{1as}.

1) Bearing numbers marked "#" designate **J-series** bearings. The tolerance of these bearings is listed in **Table 6.8** on page **A-66** to **A-67**.
2) Dimensions with "–" indicate a load center at the outside on the end of an inner ring.

2) Bearing numbers marked "∗" designate **ULTAGE series** bearings.

Spherical Roller Bearings

1. Types, design features, and characteristics

Spherical roller bearings consist of an outer ring having a continuous spherical raceway and two rows of barrel-shaped rollers guided by an inner ring with two raceways. (Refer to **Fig. 1**) This bearing has self-aligning properties, and therefore is suited for use where misalignment between the inner and outer rings occurs from housing installation error or shaft bending.

Spherical roller bearings have a large capacity for radial loads, axial loads in either direction, and combined loads. They are also suited for applications where vibration and shock loads are encountered. When spherical roller bearings are used with a vertical shaft or under a large axial load, the load on the rollers of the row that is not subject to the axial load becomes small, and the resulting skidding on the rollers may result in wear. If the ratio of the axial load to the radial load exceeds the factor e in the dimension table ($F_a/F_r > e$), consult **NTN** Engineering.

In addition to spherical roller bearings with cylindrical bores, spherical roller bearings with tapered bores are also available. Bearings with tapered bores are specified by the suffix "K" at the end of the spherical roller bearing part number. The standard taper ratio is 1:12 for bearings with a "K" suffix; for bearings in series 240 and 241, the suffix "K30" indicates the taper ratio for a bearing is 1:30. Most tapered bore bearings incorporate the use of adapters and withdrawal sleeves for shaft mounting.

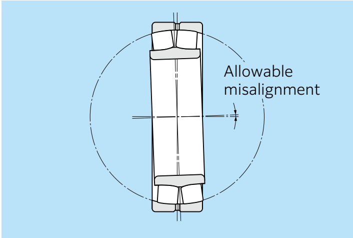

Fig. 1

Table 1 Types of spherical roller bearings

Type	ULTAGE series [1] EA type	ULTAGE series [1] EM type	ULTAGE series [1] EM type (large size)
Design			Bearing series	Series other than 213 with outer diameter of 420 mm or smaller		Series with outer diameter of 440 to 580 mm
Rollers	Symmetrical		
Cage type	Pressed cage	Machined cage	Machined cage
Cage shape			Max. operating temperature	200°C		
Type	**B type**	**213C type**	**213 type**
Design			Bearing series	Other than ULTAGE series (outer diameter of 300 mm or larger)	Series 213 with bore diameter of 50 mm or smaller	Series 213 with bore diameter of 55 mm or larger
Rollers	Asymmetrical	Symmetrical	Asymmetrical
Cage type	Two-piece machined cage	Two-piece pressed cage	Machined cage
Cage shape			
Max. operating temperature	120°C (instantaneous) 100°C (continuous)		

1) ULTAGE series spherical roller bearings has been developed for "longer life," "improved loading capability," and "higher speed," which are required for various types of industrial machinery.
For details, please refer to the special catalog "**ULTAGE series spherical roller bearings [EA and EM types] (CAT. No. 3033/E).**"

2. ULTAGE series fits

Table 2 Shaft tolerance class in common use

Condition		Shaft diameter (mm) Over	Shaft diameter (mm) Incl.	Shaft tolerance class	Note
Cylindrical bore bearing (class 0)					
Inner ring rotational load or load of undetermined direction	Light load [1] or Normal load [1] or Fluctuating load	18 25 40 60 100 200	25 40 60 100 200 500	k5 m5 n5 n6 p6 r6	
	Heavy load [1] or Impact load	50 70 140	70 140 200 [2]	n5 p6 r6	Use bearings with larger internal clearances than CN clearance bearings.
Inner ring: Stationary Load	Inner ring must move easily over shaft.	Overall shaft diameter		g6	For large bearings, f6 will suffice to facilitate movement.
	Inner ring does not have to move easily over shaft.	Overall shaft diameter		h6	
Tapered bore bearing (class 0) (with adapter or withdrawal sleeve)					
Full load		Overall shaft diameter		h9/IT5 [3]	h10/IT7 [3] will suffice for power transmitting shafts.

1) Standards for light loads, normal loads, and heavy loads
- Light loads: dynamic equivalent radial load ≦ 0.05 C_r
- Normal loads: 0.05 C_r < dynamic equivalent radial load ≦ 0.10 C_r
- Heavy loads: 0.10 C_r < dynamic equivalent radial load

2) When the shaft diameter exceeds ϕ200 mm and the bearing is to be used under heavy load or impact load conditions, please consult **NTN** Engineering.
3) The shaft shape error (roundness, cylindricity, etc.) must be within the tolerance range of IT5 and IT7.
Note: 1. All values and fits listed in the above tables are for solid steel shafts.
2. Use the formula below to calculate necessary interference. The upper limit value should not exceed 1/1 000 of the shaft diameter.
- When F_r ≦ 0.3 C_{0r}, necessary interference Δd_F (μm) is $\Delta d_F = 0.08 (d \cdot F_r/B)^{1/2}$
- When $F_r > 0.3\ C_{0r}$, $\Delta d_F = 0.02 (F_r/B)$

(d: bearing bore diameter (mm), B: inner ring width (mm), F_r: radial load, (N), C_{0r}: basic static rating load (N))
When the difference between the bearing temperature and the ambient temperature during bearing operation is to be considered, consider the effective interference Δ_{dT} (μm) by the temperature difference as the necessary interference.
$\Delta_{dT} = 0.0015 \cdot d \cdot \Delta T$
(ΔT: Difference between bearing temperature and ambient temperature °C)

Table 3 Housing bore tolerance class in common use

Condition				Housing bore tolerance class	Note
Housing	Load type, etc.		Outer ring axial direction movement		
Single housing or divided housing	Static outer ring load	All types of loads	Yes	H7	G7 can be used for large bearings or bearings with a large temperature differential between the outer ring and housing.
		Light [1] or ordinary load [1]	Yes	H8	—
		Shaft and inner ring become hot.	Easily	G7	F7 can be used for large bearings or bearings with a large temperature differential between the outer ring and housing.
Single housing		Requires precise rotation under light or ordinary loads.	Basically no Yes	K6 JS6	— —
		Requires low noise operation.	Yes	H6	—
	Indeterminate load	Light or ordinary load	Yes	JS7	—
		Ordinary or heavy load [1]	Basically no	K7	—
		High impact load	No	M7	—
	Rotating outer ring load	Light or fluctuating load	No	M7	—
		Ordinary or heavy load	No	N7	—
		Heavy load or large impact load with thin wall housing	No	P7	—

1) Standards for light loads, normal loads, and heavy loads
Light loads: dynamic equivalent radial load $\leqq 0.05\ C_r$
Normal loads: $0.05\ C_r <$ dynamic equivalent radial load $\leqq 0.10\ C_r$
Heavy loads: $0.10\ C_r <$ dynamic equivalent radial load
Note: All values and fits listed in the above tables are for cast iron or steel housings.

3. Allowable speed of ULTAGE series

As the rotational speed of the bearing increases, the temperature of the bearing also increases because of the friction heat produced inside the bearing. Excessive heat will significantly deteriorate the bearing performance, causing abnormal temperature rises and seizure.

Factors affecting the allowable speed of bearings are as follows.

(1) Bearing type
(2) Bearing size
(3) Lubrication (grease lubrication, circulating lubrication, oil lubrication, etc.)
(4) Bearing internal clearance (bearing internal clearance during operation)
(5) Bearing load
(6) Shaft and housing accuracy

The allowable speed specified in the bearing dimension table is the limit for heat dissipation and satisfactory lubrication conditions before the bearing is adversely affected.

The allowable speed of ULTAGE series spherical roller bearings specified in the catalog is defined as follows.

[Oil lubrication]
The allowable speed for oil lubrication is the speed at which the outer ring temperature reaches 80°C with room temperature spindle oil (lubrication oil viscosity: VG32) supplied at 1 liter/min under an operating load of 5% of the basic static load rating C_{0r}.

[Grease lubrication]
The allowable speed for grease lubrication is the speed at which the outer ring temperature reaches 80°C with lithium-based grease (consistency: NLGI3) filled 20%-30% of the free space under an operating load of 5% of the basic static load rating C_{0r}.

In either of the lubrication methods, the bearing temperature rise differs if the usage condition (operating load, rotational speed pattern, lubricating condition, etc.) is different; therefore, the bearings must be selected with sufficient allowable speed as specified in the catalog.

If 80% of the allowable speed specified in the dimension table is exceeded or the bearing is used in vibration or impact conditions, please consult **NTN** Engineering.

See section “9. Allowable speed” for the allowable speed of the spherical roller bearings that are not part of the ULTAGE series.

4. Oil hole and groove for outer ring

Both ULTAGE series and B type spherical roller bearings are provided with oil holes and an oil groove. (See **Fig. 2** and **Table 4**)

Types 213 and C do not have oil holes and grooves. However, they can be made based on customer request. Contact **NTN** Engineering with the bearing numbers and supplementary suffix code "D1" (refer to page A-48).

If a pin to prevent outer ring rotation is necessary, contact **NTN** Engineering.

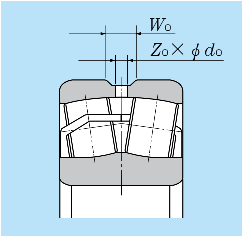

Fig. 2

Table 4 Oil inlet number

Nominal bearing outside diameter mm		Number of oil holes	
		D1	W33 (European spec)
Incl.	Below	Z_0	Z_0
–	320	4	3
320	1 010	8	3
1 010	–	12	–

For oil groove width W_0 and diameter of oil hole d_0, see the dimension table.

5. Allowable misalignment angle

Spherical roller bearings have the same self-aligning properties as other self-aligning bearings. The allowable misalignment angle varies according to dimension series and load conditions, but the general allowable misalignment angles are listed below:

- Normal load or more: ··············· 1/115
- Light load: ····························· 1/30

∗Increasing the misalignment angle beyond the allowable angle may cause the rollers to protrude from the outer ring and interfere with nearby components.

Spherical Roller Bearings NTN

6. Adapters and withdrawal sleeves

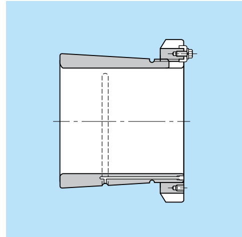

Fig. 3

Adapters are used for installation of bearings with tapered bores on cylindrical shafts. Withdrawal sleeves are also used to install and disassemble bearings with tapered bores onto and off of cylindrical shafts. In disassembling the bearing from the shaft, the nut is turned against the side face of the inner ring utilizing the bolt provided on the withdrawal sleeve, and then the sleeve is drawn away from the bearing's bore. (Precision and dimensions of adapter and withdrawal sleeve are defined in JIS B 1552 and JIS B 1556).

For bearings with a bore diameter of 200 mm or more, high pressure oil (hydraulic) type adapters and withdrawal sleeves can be made to make installation and disassembly easier. As shown in **Fig. 3** construction is designed to reduce friction by injecting high pressure oil between the surfaces of the adapter sleeve and bearing inner bore by means of a pressure fitting.

If the oil supply inlet is attached in the nut side of the adapter, the supplementary suffix "HF" is added to the bearing number; if the oil supply inlet is attached on the opposite side, the suffix "HB" is added to the bearing number. For adapter sleeves, the supplementary suffix "H" is added to the bearing's number for both cases. The hydraulic sleeve nut is equipped with holes for bolts used for mounting and dismounting and holes for hydraulic piping. The suffix SP (with screw holes) or SPB (with bolts) is added to the bearing number of the nut.

For information on the **hydraulic adapters and withdrawal sleeves**, see **the special catalog (CAT. No. 4201/E)**.

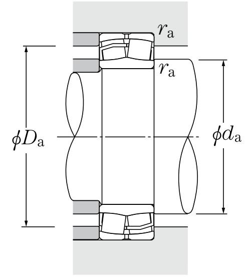
1) Bearing part numbers with * are **ULTAGE Series** and have outer ring oil holes and oil grooves as standard.
2) "K" indicates bearings having a tapered bore with a taper ratio of 1:12. 3) Smallest allowable dimension for chamfer dimension r.



Dynamic equivalent radial load
$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	Y_1	0.67	Y_2

Static equivalent radial load
$P_{0r} = F_r + Y_0 F_a$
For values of e, Y_1, Y_2 and Y_0 see the table below.

Installation-related dimensions (mm)					Constant	Axial load factors			Mass (approx.) kg

145	139	191	183	2	0.22	3.01	4.48	2.94	5.9	5.73

Note: For the bearings other than **ULTAGE Series**, outer rings with oil inlets and oil grooves can also be made based on your request.
In this case, supplementary suffix "D1" is added after a bearing number. **Example: 21322D1**

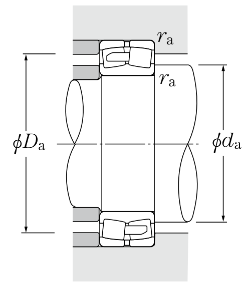
1) Bearing part numbers with ∗ are the **ULTAGE Series** EM type (large size) and have outer ring oil holes and oil grooves as standard.
2) Bearings appended with "**K**" have a tapered bore ratio of 1:12; bearings appended with "**K30**" have a tapered bore ratio of 1:30.
3) Smallest allowable dimension for chamfer dimension r.



Dynamic equivalent radial load

$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \leqq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y

1) Bearing numbers marked "∗" designate ULTAGE Series. 2) Indicates the adapter mass.
Note: 1. Refer to pages B-218 to B-221 for bearing dimensions, rated loads, and mass.
2. Refer to pages D-2 to D-10 and D-12 to D-14 for adapter locknut and washer dimensions.
3. Adapter numbers which are appended with the code "X" indicate narrow slit type adapters which use washers with straight inner tabs.

1) Standard thread shapes and dimensions are as per JIS B 0205-1 and JIS B 0205-4 (general metric thread), and JIS B 0206 (metric trapezoidal screw thread).
2) Indicates reference dimensions before withdrawal sleeves are attached.
3) Bearing numbers marked "∗" designate ULTAGE Series.
4) Indicates withdrawal sleeve mass.
5) Indicates the number of nuts to be used at the time of disassembly. Refer to pages D-2 to D-10 for nut dimensions.
Note: Refer to pages B-226 to B-229 for bearing dimensions, rated loads, and mass.

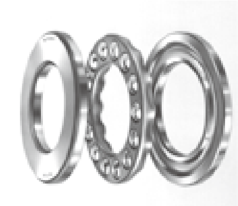
Thrust Bearings



Single direction thrust ball bearings

Thrust spherical roller bearings

Thrust bearings are designed primarily to support axial loads at contact angles between 30° and 90°. Similar to radial bearings, thrust bearing designs may incorporate balls or rollers as rolling elements.

The configuration and characteristics of each type of bearing are given below.

With thrust bearings, it is necessary to supply an axial preload in order to prevent slipping between the bearing's rolling elements and raceways.

For more detailed information, please refer to section "8.3 Bearing preload."

1. Single direction thrust ball bearings

As shown in **Fig. 1**, the steel balls of single direction thrust ball bearings are arranged between a pair of a pair of washers (shaft washer and housing washer), and the normal contact angle is 90°. Axial loads can be supported in only one direction, and radial loads cannot be accommodated. These bearings are not suitable for high speed operation.

Table 1 lists the standard cage types for single direction thrust ball bearings.

Fig. 1 Single direction thrust ball bearing (example of pressed cage)

Table 1 Standard cage types for single direction thrust ball bearings

Cage type / Bearing series	Resin cage	Pressed cage	Machined cage
			
511	51100 ~51107	51108 ~51152	51156 ~511/530
512	51200 ~51207	51208 ~51224	51226 ~51260
513	—	51305 ~51320	51322 ~51340
514	—	51405 ~51415	51416 ~51420

Note: Due to their material properties, resin cages can not be used in applications where temperatures exceed 120°C.

2. Thrust spherical roller bearings

Just like spherical roller bearings, the center of the spherical surface for thrust spherical roller bearings is the point where the raceway surface of the housing raceway washer meets the center axis of the bearing. Since thrust spherical roller bearings incorporate barrel-shaped rollers as rolling elements, they also have self-aligning properties. (See **Fig. 2**) Under normal load conditions, the allowable misalignment is 1/60 to 1/30, although this will vary depending upon the bearing's dimension series.

These bearings use machined copper alloy cages and a guide sleeve for the cage is attached to the inner ring. These bearings have a high axial load capacity, and can accommodate some radial load when the ring is axially loaded. It is necessary to operate these bearings where the load condition meets $F_r / F_a \leqq 0.55$.

The design for spherical thrust bearings is such that lubricant cannot enter the gap between the cage and the guide sleeve. Therefore, oil lubrication should be used, even in low speed operation.

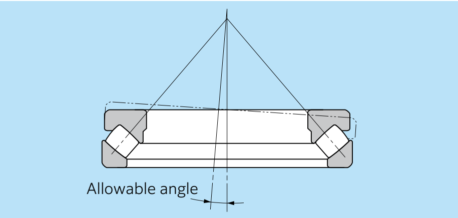


Fig. 2 Thrust spherical roller bearings

3. Thrust cylindrical roller bearings

Thrust bearings incorporating cylindrical rollers are available in single row, double row, triple row, and four row varieties. (See **Fig. 3**) **NTN** Engineering offers the 811, 812 and 893 series that conform to dimension series 11, 12 and 93 prescribed in JIS, as well as other special dimensions.

While thrust cylindrical roller bearings are only able to receive axial loads, the axial loads can be heavy due to the high axial rigidity of the bearing. For series 811, 812, and 893, the dimension tables are listed section "E. Needle roller bearings." Bearings with dimensions not listed in the dimension tables are also manufactured. Contact **NTN** Engineering for more information.

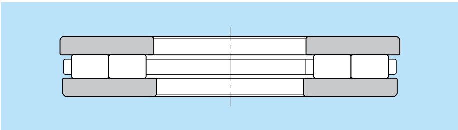

Fig. 3 Double row thrust cylindrical roller bearings

4. Thrust tapered roller bearings

Although not listed in the dimension tables, tapered roller bearings like those in **Fig. 4** are also manufactured. Contact **NTN** Engineering for more detailed information.

1) Smallest allowable dimension for chamfer dimension r.

Special Application Bearings Contents

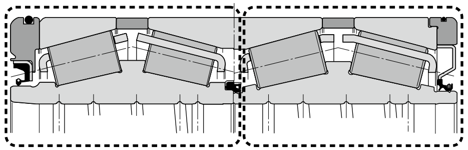
Special Application Bearings

The ULTAGE series sealed four-row tapered roller bearings [CROU···LL type] are designed to provide "high-load capacity," "high static load capacity," and "high sealing performance." These traits are required for steel rolling mill roll neck applications neck applications to improve reliability with a longer operating life.

1. Features

1) High-load capacity design

Higher load capacity and longer operating life are achieved by maximizing the size and number of rollers in the bearing.



Conventional specification | ULTAGE specification

2) World class static load capacity

Static load capacity is greatly improved due to optimized crowning of the rolling elements, reducing edge stress in the application under heavy loads.

3) Compact seal design with high sealing performance

The ULTAGE series four-row tapered roller bearing utilizes a specially designed fluorine rubber seal for high sealing performance, while minimizing the volume of the seal within the bearing.

Optimizing the tension force of the main seal lip and the overall design of the seal to minimize contamination ingress, reduces the internal water immersion by 50% or more while preventing grease from flowing out from the sub lip.

4) Standard adoption of long-life grease

This bearing is filled with an ample amount of long-life grease to avoid the need for cleaning or filling the bearing with grease before assembling into the application.

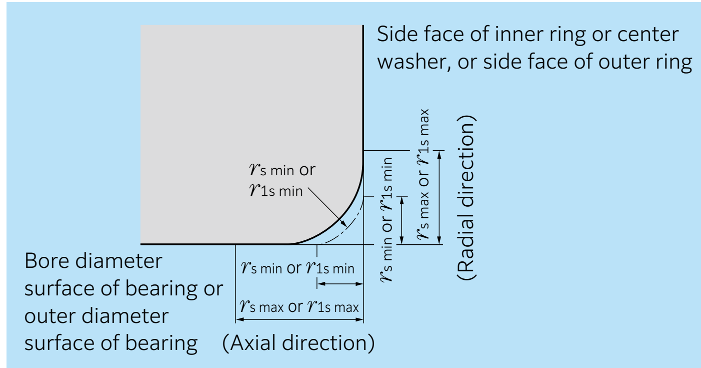
2. Part number

(A-) CROU- 6001 LLA1X PX1

- PX1 — Tolerance code
- LLA1X — Seal code
- 6001 — Bearing bore diameter No. + serial No.
- CROU- — Bearing type (ULTAGE series four-row tapered roller bearing)
- (A-) — Option (special heat treatment*)

* austenite-strengthening treatment

3. Chamfer dimension



Unit: mm

$r_{s\,min}$ or $r_{1s\,min}$	Nominal bearing bore diameter d Over	Incl.	$r_{s\,max}$ or $r_{1s\,max}$ Radial direction	Axial direction
1	50	—	1.9	3
1.5	120	250	2.8	3.5
	250	—	3.5	4
2.5	120	250	4	5.5
	250	—	4.5	6
3	120	250	4.5	6.5
	250	400	5	7
	400	—	5.5	7.5

4. Operating temperature range

−20～120°C

5. Bearing fits (recommended)

Metric series : Shaft d6/housing G7
Inch series : Contact **NTN** Engineering.

6. Standard grease fill

Brand : Kyodo Yushi Palmax RBG (L373)
Amount : Space volume ratio 35%

7. Allowable speed

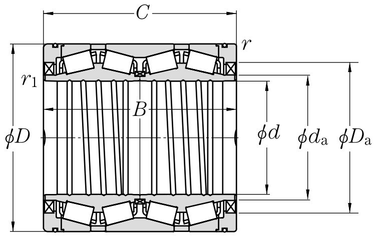
$d_m \cdot n \leqq 30 \times 10^4$

d_m : Roller pitch diameter (mm) ≒ $(d+D)/2$
d : Bearing bore diameter (mm)
D : Bearing outside diameter (mm)
n : Rotational speed (min^{-1})

The above are approximate standard values and may not be appropriate depending on the usage condition. For details, please contact **NTN** Engineering.

8. Material

Inner and outer rings : Case hardened steel
Rolling elements : Bearing steel
(* mark in the dimension table indicates case hardened steel.)



ULTAGE Sealed Four-Row Tapered Roller Bearings for Rolling Mill Roll Necks [CROU···LL Type] NTN

Dynamic equivalent radial load

$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y

1) Smallest allowable dimension for chamfer dimension r.
2) Consult with **NTN** Engineering because the appropriate value may change depending on the use conditions.
3) Bearing numbers marked "*" use rolling elements made of case hardened steel.

The ULTAGE series sealed spherical roller bearings [WA type] are designed to meet the demands of "long operating life," "improved reliability," and "improved easy handling," which are required for various types of industrial machinery.

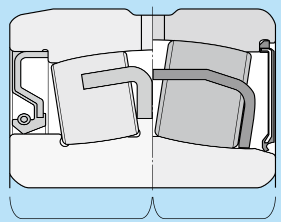
1. Features

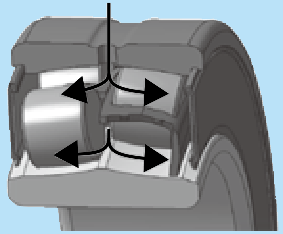
1) World class load capacity
Higher load capacity and longer operating life have been realized by adopting the internal specifications of the EA type, which includes maximum possible roller diameter size, maximum possible number of rollers, and a "basket-shaped" pressed steel cage.

2) Compact design with minimized seal volume
The standard seal design is a "contact type" dust resistant seal designed to minimize the volume of the seal within the bearing.
(1) Foreign matter intrusion is prevented by the adoption of the specially designed contact type rubber seal.
(2) Consistent dust resistance is achieved without changing the contact surface pressure of the seal with respect to the bearing alignment.

3) Standard adoption of long-life grease
This bearing is filled with an ample amount of long-life grease to avoid the need for cleaning or filling the bearing with grease before assembling into the application.
(1) Grease brand: Shell Alvania EP Grease 2 (8A) with extreme-pressure additive for heavy loads
(2) Grease amount: Space volume ratio 15 to 25%

4) Standard adoption of oil holes
The bearing is able to be re-greased due to the oil grooves and oil holes that are standard in the outer ring.





ULTAGE Spherical Roller Bearings with Seal【WA Type】 NTN

2. Part number

WA 222 20 EA LLS K D1 C3

- Seal type code (WA)
- Dimension series code (222)
- Bore diameter No. (20)
- Bearing type code (EA)
  - EA : basket-shaped pressed steel cage
- Both side contact seal (LLS)
- Raceway shape code (K)
  - No code : inner diameter cylindrical bore
  - K : inner diameter tapered bore
- Oil hole/oil groove code (D1)
  - D1 : with oil hole/oil groove (spec. D1 only)
  - W33 : with oil hole/oil groove (Europe specification)
- Internal clearance code (C3)

3. Allowable speed

When grease is supplied : $d_n \leqq 6 \times 10^4$
When no grease is supplied : $d_n \leqq 8 \times 10^4$

∗d_n value:
[d_n = bearing bore diameter d (mm) × rotational speed n (mm^{-1})]

4. Allowable temperature range

Bearing temperature: −20〜110°C

5. Allowable misalignment angle

1/115 (mm/mm)

6. Handling precautions

1) The radial internal clearance on an ULTAGE series sealed spherical roller bearing with tapered bore cannot be measured with a clearance (thickness) gauge. Please manage the clearance after assembly by measuring the movement in the axial direction shown in **Table 15.1** (A-159) in section "15. Bearing handling."
2) When the bearing misalignment exceeds the allowable misalignment (1/115), the rollers may come in contact with seal and cause seal deformation. It should be noted that the seal may come off when a large force is applied in this state.
3) Use Li-based mineral grease when re-greasing. Consult with **NTN** Engineering when using other types of grease.
4) When temperature mounting for assembly, the bearing temperature must be 100°C or below. The method of immersing bearings in hot oil cannot be used for this bearing type.

Special Application Bearings

1. Features

The ULTAGE series spherical roller bearings with high-strength cage [EMA type] use dedicated machined brass cages. These bearings are suitable for mining machinery (vibrating screens, crushers, etc.), which experience eccentric rotation and impact loads.

Design	Bearing series	223 series inner diameter 70 to 200 mm
Roller	Symmetrical
Cage type	Special machined cage

2. Accuracy and clearance (specification for vibrating screens)

The inner and outer diameter tolerance and the radial internal clearance are set for vibrating screens to obtain the desired operating clearance. See the table below for the specifications of the ULTAGE series spherical roller bearings for the bearing specifications (accuracy, clearance, etc.) to be used with vibrating screens.

Unit: mm

Dimensional tolerance of mean bore diameter within plane				Dimensional tolerance of mean outside diameter within plane				Radial internal clearance (cylindrical bore)

ULTAGE Spherical Roller Bearings with High-strength Cage [EMA Type] NTN

3. Part number

2 23 20 EMA K D1 VS1

- VS1: Specification for vibrating screens (No code indicates general bearing clearance and accuracy.)
- D1: Oil hole/oil groove code (D1: with oil hole/oil groove)
- K: Raceway shape code (No code: inner diameter cylindrical bore, K: tapered bore)
- EMA: Type code
- 20: Bore diameter No. (20: 100 mm)
- 23: Dimension series code
- 2: Bearing type code (2: spherical roller bearing)

4. Allowable axial load

$F_a / F_r \leqq e$

F_a : Axial load

F_r : Radial load

e : Constant (see dimension table)

If this bearing type is used under a large axial load, the load on the rollers of the row that is not subject to the axial load can become small. This small load on the rollers can result in skidding of the rollers, which can cause bearing damage. If the ratio of the radial load exceeds the factor e in the dimension table ($F_a / F_r > e$), consult **NTN** Engineering.

5. Allowable misalignment angle

Normal load or more …… 1/115 (mm/mm)

Light load ………………… 1/30 (mm/mm)

∗For a rough estimate of normal loads and light loads, see Note 1 in General Description A-81.

2) Bearings having a tapered bore with a taper ratio of 1:12.

The ULTAGE series deep groove ball bearings for high-speed servo motors [MA type] are next-generation bearings with an optimized internal design for high-speed servo motors. These bearings have improved durability and longer grease life for high-speed operation and rapid acceleration/deceleration.

1. Features

1) High speed and high reliability

Deformation from high-speed operation is reduced and limiting speeds of d_{mn} = 1 million are achieved by using high performance cages. These cages are made of self-lubricating resin and have interlocking tabs for high rigidity (**Fig. 1**).

∗d_{mn} value:
d_m (rolling element pitch diameter mm) ×
n (rotational speed min^{-1})

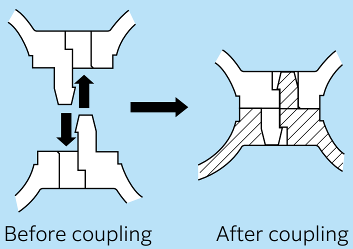

Fig.1 MA resin cage

2) Longer grease life

Outer ring grease pockets designed to maintain grease near the rolling elements improve lubrication reliability. In addition, long-life grease for motors "ME-1" (see **Table 11.6** (A-116)) is applied for the initial grease fill.

(Longer life of five times or more is achieved compared with the lithium-based grease used for general purposes.)

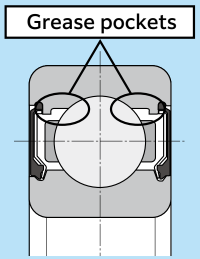

Fig. 2 Grease pockets

3) Low noise

A new resin interlocking cage design allows for low noise operation. The noise is reduced by 3 dB-A with respect to metal pressed cages.

Table 1 Measurement result of noise values

Specification	Noise value
Metal pressed cage	57 dB-A
ULTAGE product	**54 dB-A**

2. Part number

6 3 08 MA LLB-BR C3 P5 / L700 QTK

- **QTK** — Grease fill code
- **L700** — **Grease brand code:** ME-1
- **P5** — **Accuracy code:** JIS class 5
- **C3** — **Radial internal clearance:** C3 clearance (15 to 33 μm)
- **LLB-BR** — **Seal code:** Synthetic rubber seal (non-contact type)
- **MA** — **Cage code:** ULTAGE series MA type
- **08** — **Nominal bearing bore diameter:** 40 mm
- **3** — **Diameter series:** 3
- **6** — **Bearing type:** Deep groove ball bearing (type code 6)

3. Operating temperature range

−20～120°C

4. Allowable speed

The allowable speed refers to a rotational speed of the bearing based on:

- Maximum outer ring temperature of 80°C
- Standard ME-1 grease filled to a fill volume of 15-20% of the free space.
- Spring preload is applied to the bearing.
- Bearing operation at room temperature after break-in procedure.

The bearing temperature increase differs depending on the usage condition (operating load, environmental temperature, rotational speed pattern, etc.); therefore, the bearings must be selected with sufficient allowable speed as specified in the catalog.

If the bearing will continuously operate above 80% of the limiting speed listed in the bearing dimension tables, please consult **NTN** Engineering.

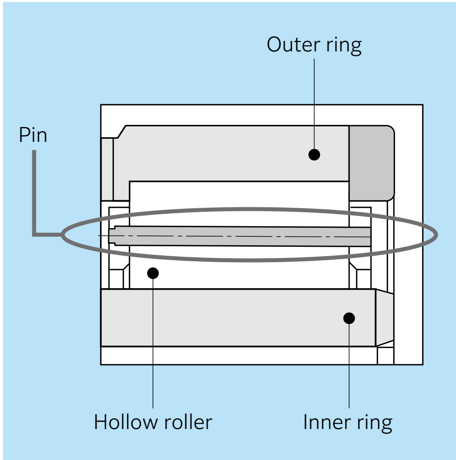
Note: For bearing models that are not specified in the list of series dimensions, please contact **NTN** Engineering.

Special Application Bearings

Four-row cylindrical roller bearings

1. Features

1) The bearings are mainly used in the roll necks of steel rolling mills and designed so that the load rating is maximized in the allowable space of the roll neck part.
2) The cage types include a comb type cage and a pin type cage (that uses hollow rollers). The pin type cage maximizes the number of rollers for high load capacity.
3) Carburizing steel is used in some cases to prevent inner ring cracks and to improve shock resistance.
4) Consult **NTN** Engineering for bearing internal clearance and fits to be used for back-up rolls of rolling mills.
5) There are many varieties of these bearings, including bearings which are sealed, have tapered bores, designed for high speed, have creep prevention, etc. Contact **NTN** Engineering for further details.



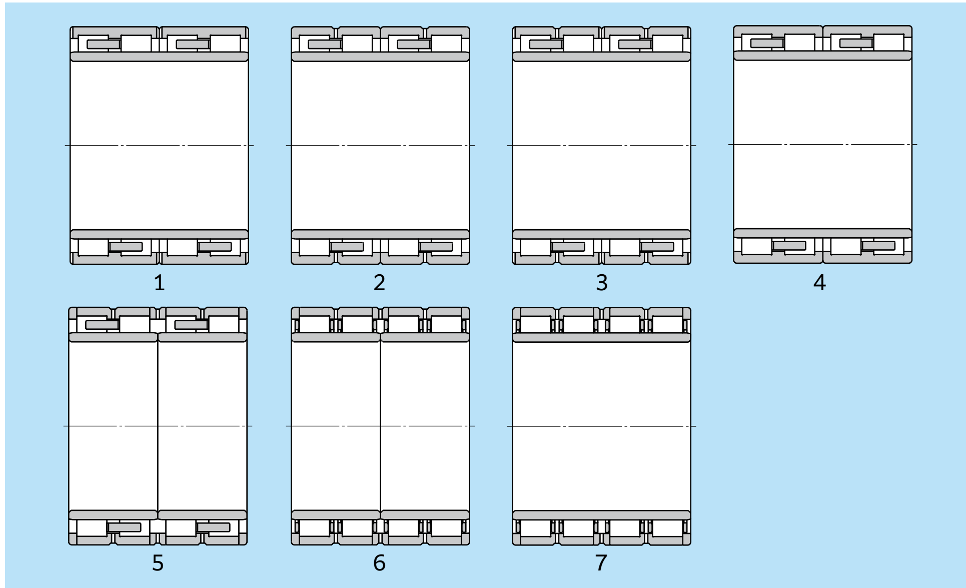
Pin type cage

2. Designs

Illustrations 1 to 7 show the several types of four-row cylindrical roller bearings that differ by the basic structure of inner rings, outer rings, and outer ring spacers.

The dimension table has the identification code (illustration + suffix code + oil groove code) specified in the illustration number column.

Example) In the case of illustration: 6, suffix code: M, oil groove code: ①, identification code "6M①" is specified in the illustration number column.



Design

Identification code

See the above illustrations 1 to 7.

＊ Illustrations 1 to 5 use solid rollers + comb type machined cage.
＊ Illustrations 6 to 7 use hollow rollers + pin type cage.

Suffix code

M : The oil hole of the outer ring is provided with a fitting nozzle for oil mist.
R : The inner diameter surface of the inner ring has a helical groove.
S : Special specification

Oil groove code

① : Oil groove on both side faces of inner ring
② : Oil groove on one width surface of inner ring
③ : Oil groove on one width surface of outer ring
④ : No oil hole or oil groove on outer ring spacer

1) Smallest allowable dimension for chamfer dimension r or r_1.
2) Bearings marked "K" have a tapered bore with a taper ratio of 1:12.
3) Boundary dimension parts are shown in the above drawing. Refer to **C-19** for the details of drawings.

Special Application Bearings

1) Smallest allowable dimension for chamfer dimension r or r_1.
2) Boundary dimension parts are shown in the above drawing. Refer to **C-19** for the details of drawings.

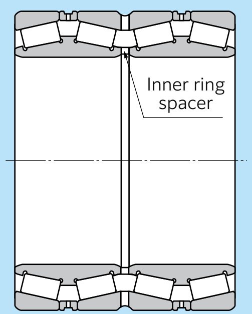
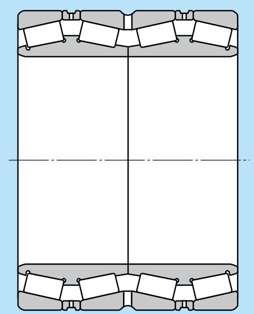
Four-row tapered roller bearings

1. Features

1) This type of bearing includes two double-row inner rings with rollers, one double-row outer ring, two single-row outer rings, and two outer ring spacers (**Fig. 1** TYPE B). There is also a type with an inner ring spacer (**Fig. 1** TYPE A). These bearings are manufactured so that the internal clearance values are fixed. Due to this, only parts with identical manufacturing numbers can be used, and they must be assembled according to their code numbers.
2) These bearings are mainly used in the roll necks of steel rolling mills and designed so that the load rating is maximized in the allowable space of the roll neck part.
3) Loose fitting is used to make the assembly and removal of the bearings easy. Carburizing steel is used to prevent inner ring cracks due to creeping and to improve shock resistance. There is also a bearing design with a helical groove in the inner ring bore to prevent wear.
4) The cage type includes a pressed steel cage and a pin type cage (that uses a hollow roller as shown in **Fig. 2**). The pin type cage maximizes the number of rollers in the bearing to provide increased load capacity.



(TYPE A)
With inner ring spacer



(TYPE B)
Without inner ring spacer

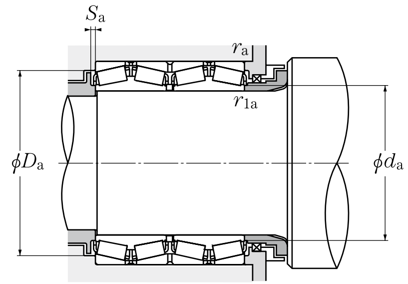
1) Smallest allowable dimension for chamfer dimension r or r_1.

Four-Row Tapered Roller Bearings



Dynamic equivalent radial load
$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	Y_1	0.67	Y_2

Static equivalent radial load
$P_{0r} = F_r + Y_0F_a$
For values of e, Y_1, Y_2 and Y_0 see the table below.

a) Bearing numbers marked "◎" designate inch series bearings. b) When adopting bearings with bearing numbers marked with "∗", please consult **NTN** Engineering.
c) Bearing numbers marked "☆" designate bearings with hollow rollers and pin type cages. d) Contact **NTN** Engineering for bearing numbers (TYPE B) without an inner ring spacer that are not listed.

The **NTN** ultra-thin section type ball bearings are bearings with an extremely thin design. There are three ultra-thin ball bearing types: radial, four-point contact, and angular. Bearing seals are available for all types.

Each bearing type has different characteristics to best support a wide range of applications.

1. Types and features

Table 1 shows the types and features of ultra-thin section type ball bearings, corresponding dimension series code, bearing cross section dimension, and inner diameter dimension range.

The dimension table (from C-62 to C-65) shows dimension series codes S and A, and H and J for bearings with seal.

Table 1 Types and features

	Types			Dimension series code	Bearing cross section dimension mm	Inner diameter dimension range mm
	Radial type	4-point contact type	Angular type			
					 $\frac{D-d}{2} \times B$	 d
Features	A deep groove is present in both the inner and outer rings of the bearing, allowing them to support radial and axial loads in either direction as well as the complex loads which result from the combination of these forces. Deep groove ball bearings are used in the most applications.	When inner and outer rings are loaded in the radial direction, the ball comes into contact with the inner and outer rings at four points. The bearings are generally suitable for two contact points under a simple axial load or a complex load with a large axial load.	Angular contact ball bearings have a straight line that runs through the point where each ball contacts the inner and outer rings at two points at 30° with respect to the radial direction. The bearings can receive a unidirectional axial load or a complex load of radial load and axial load. The ability to include an increased number of balls increases the load capacity of the bearing. These bearings are normally used in pairs for applications where it is necessary to control the axial movement via axial internal clearance or preload.	S	4.762 × 4.762	25.4 ~ 38.1
				A	6.35 × 6.35	50.8 ~ 304.8
				B	7.938 × 7.938	50.8 ~ 508

Fixed side SL type cylindrical roller bearing (open type)

Floating side SL type cylindrical roller bearing (open type)

SL type cylindrical roller bearing for sheaves (sealed type)

1. Types, design features, and characteristics

SL type cylindrical roller bearings are double-row full complement cylindrical roller bearings that have a thin cross-section and can withstand extremely large radial loads and impact loads. These bearings are suitable for a wide range of slow-moderate speed, heavily loaded applications such as construction machinery, vehicles, steel machinery, and lifting machinery.

These bearings can be produced both with and without seals. **Table 1** shows the characteristics of this bearing type.

Table 1 SL type cylindrical roller bearing types and characteristics

Type		Features
Open type	 SL01 type  SL02 type	● The SL01 type is used for fixed side bearings and the SL02 is used for float side bearings. ● The outer ring is divided in the circumferential direction by a special method and reconnected after rollers are embedded. **The bearing side surface needs to be firmly fixed in the axial direction by the shoulders of shafts and housings**. ● The outer ring has oil grooves and oil holes. ● The SL01 type can receive an axial load in both directions. ● Dimensions D_a and d_a are applied for the shoulder dimension of shafts and housings. However, when a moment load or a large axial load is to be used, dimensions J and K are recommended. The dimension table (from C-68 to C-71) shows dimension series codes d_a, D_a, J and K.
Sealed type	 SL04 type	● The SL04 type is only designed as the fixed side bearing. ● The inner ring is divided in the circumferential direction by a special method and reconnected after rollers are embedded. **The bearing side surface needs to be firmly fixed in the axial direction by the shoulders of shafts and housings**. ● The inner ring has oil grooves and oil holes. ● A radial load and an axial load in both directions can be applied to the bearing. ● The bearings are shielded, filled with grease, and have snap rings in the outer ring. These bearings are allow easy design into the application. The bearings are mainly used for sheaves. ● Surface coating treatment is applied to prevent rust.

Note: For SL type cylindrical roller bearings, three-row, four-row, and five-row bearings are also available besides the double-row.
Please contact **NTN** Engineering.

2. Dimensional and rotational accuracy

SL type cylindrical roller bearings are made according to JIS class 0 (refer to **Table 6.4** (A-58 to A-59) in section "6. Bearing tolerances"). The outer ring accuracy of the SL01 type and the SL02 type is before division. Regarding the SL04 type, the inner ring accuracy is before surface treatment and division, and the outer ring accuracy is before surface treatment.

3. Radial internal clearance

Table 2 shows the radial internal clearance values. It should be noted that the values differ from standard cylindrical roller bearings.

4. Selection of recommended fits and radial internal clearance

Table 3 shows the recommended fits when the bearings are used in outer ring rotating applications such as sheaves and wheels. **Table 4** shows the relationship between the fits and the radial internal clearance.

It is necessary to equally apply load on the entire surface of the raceway end on the bearing side face at the time of assembly and removal.

Table 2 Radial internal clearance unit: μm

Nominal bearing bore diameter d mm		CN (normal)		C3		C4	
Over	Incl.	Min.	Max.	Min.	Max.	Min.	Max.
30	50	20	75	40	95	55	110

400	500	180	320	300	440	395	535

Table 3 Recommended fits

Condition		Shaft tolerance class	Housing tolerance class
Outer ring rotational load	Heavy load with thin wall housing	g6 or h6	P7
	Ordinary or heavy load		N7 [1]
	Light or fluctuating load		M7

1) N7 must be used for sheaves (to prevent snap ring from coming off).

Refer to **Table 7.2** (A-80) in section "7. Bearing fits" for the inner ring rotational load.

Table 4 Relationship between fits and radial internal clearance

Housing fits	Housing fits: G 7	H 6	J 6	J 7	K 6	K 7	g 6	M 6	M 7	N 6	N 7	P 6	P 7
g 6	CN(normal)	CN(normal)	CN(normal)	CN(normal)	CN(normal)	CN(normal)	CN(normal)	CN(normal)	CN(normal)	C 3	C 3	C 3	C 3

Note: 1. The bearings have grease filled in. 2. Surface treatment is applied to bearings to prevent rust.
3. The bearings are non-contact shielded type bearings, but contact sealed type bearings are also available based on your request.

Note: 1. The bearings have grease filled in. 2. Surface treatment is applied to bearings to prevent rust.
3. The bearings are non-contact shielded type bearings, but contact sealed type bearings are also available based on your request.

●*ULTAGE* Precision Rolling Bearings for Machine Tools

For angular contact ball bearings for machine tools with a contact angle of 15° and bearing tolerance of JIS class 5 or higher, cylindrical roller bearings having bearing tolerance of JIS class 5 or higher, tapered roller bearings having bearing tolerance of JIS class 5 or higher, and bearings for supporting ball screws, see the special catalog "**Precision rolling bearings (CAT. No. 2260/E)**".

●Bearings for Special Environments

Bearings for special environments are bearings that can be used for clean environments and high vacuum environments, where conventional bearings would not be acceptable. Bearings for special environments can also be used for the development of space equipment, vacuum equipment, and semiconductor manufacturing equipment. For details, see the special catalog "**Ultra final series bearings for clean environment (CAT. No. 3028/E)**."

●Rubber Molded Bearings

Rubber molded bearings are rubber rollers made by baking and bonding urethane rubber directly to the outer diameter of small deep groove ball bearings. Rubber molded bearings are suitable for low vibration and low noise applications, and feed mechanisms that require accuracy. For details, see the special catalog "**Rubber molded bearings (CAT. No. 3021/J)**."

●MEGAOHM™ Series Insulated Bearings

Bearings used for electric equipment such as motors and generators may cause electrolytic corrosion due to leakage current, which shortens the bearing life. MEGAOHM™ series insulated bearings are the bearings developed to prevent this electrolytic corrosion. The series includes ceramic and resin type bearings. For details, see the special catalog "**MEGAOHM™ series insulated bearings (CAT. No. 3030/E)**."

●Clutches/Torque Limiters

1) One-way clutch

The driving force is transmitted only in one direction. In the opposite direction, the driving and idling can be switched by a clutch with a mechanism for idling. **NTN** provides a variety of one-way clutches to meet various needs.

For the clutch models, handling precautions, and other details, see the special catalog "**Clutches (CAT. No. 2900/E)**."

2) Torque limiter units

The **NTN** torque limiter unit (NTS type) is a unit composed of an inner ring, a coil spring, an external resin part, and a lid. When the torque acting between the inner ring and the external resin part is low, the inner ring and the outer resin part are rotated simultaneously. Under high torque conditions, the inner ring and the outer resin part are relatively rotated while keeping a constant torque.

For the torque limiter models, handling precautions, and other details, see the special catalog "**Torque limiter units (CAT. No. 6404/J)**."

1) Used for adapter series H31, H2, H32, H3, and H23.
Note: Numbers AW00 and AW01 (bent inner tab type) indicate dimensions that are not indicated in JIS B 1554.

Allowable washer dimensions(bent inner tab type) Unit: mm

Bore dia. of lockwasher d_3 mm: Over	Incl.	Dimensional tolerance of distance between lockwasher tab to bore diameter face ΔM_S: Upper	Lower	Dimensional tolerance of lockwasher tab width Δf_{1S}: Upper	Lower
10[1]	50	+0.3	0	0	−0.4
50	80	+0.3	0	0	−1
80	120	+0.5	0	0	−1.4
120	200	+0.5	0	0	−2

1) 10 mm is included in this dimensional division.
Note: The dimensional tolerance in the table also applies to the **AWL** series bent inner tab type.

1) Used for adapter series H31, H32, and H23.
Note: For wide slit type adapter sleeves that have no suffix "X" after the adapter number, either straight or bent inner tab washers can be used.

Rolling Bearing Accessories

Balls

The **NTN** steel balls conform to JIS B 1501 (steel ball for ball bearings). Contact **NTN** Engineering for any request.

High-carbon chromium bearing steel is generally used for the material. Some special types use stainless steel and heat-resistant steel.

The accuracy conforms to the JIS (JIS B 1501). Please consult **NTN** Engineering for details.

G200	5	5	0.150	10	15	−60,	......,	−15,	0,	+15,	......,	+60

1) Measure the dimension excluding the flaws because the values do not incorporate flaws on the surface.

3. Hardness

Nominal dimension	Hardness	
	HV	HRC
0.3mm to 3mm	772 to 900	(63 to 67)[2)]
1/8 to 30mm	—	62 to 67
1 3/16 to 4	—	61 to 67

2) The value in ( ) is shown by reference to the converted value.

Rolling Bearing Accessories

Rolling Bearing Accessories

High-carbon chromium bearing steel is used for needle rollers. The needle rollers ar ground and polished after heat treatment. The surface hardness is 60 to 65 HRC.

Needle rollers are provided as rolling elements or pins for operation directly on the shaft.

1. Shape of needle rollers

The standard shape of needle rollers has a flat surface on its end face (referred to as F type). Crowned contact surfaces are also available (suffix code: E) and can reduce the edge load on the rollers. Excessive edge load on rollers can result in premature failure. Contact **NTN** Engineering for more information.

Table 1 End face shape

Type	Designation	Shape
F	Flat surface	

2. Needle roller part number composition

The needle roller part number is composed of a model code (end face type), a dimension code [diameter (D_W) x length (L_W)], and a suffix code (Refer to **Fig. 1**).

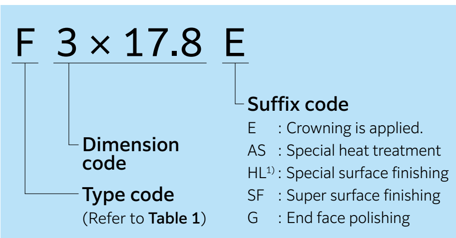

Fig. 1

1) For HL, contact **NTN** Engineering.

3. Accuracy of needle rollers

The dimensional accuracy of needle rollers is maintained in accordance with JIS B 1506 (Rolling bearings—Rollers). (Refer to **Table 2**)

Table 2 Accuracy of needle rollers Unit: μm

Characteristics	Tolerance and tolerance values
Tolerance of average value of diameter D_W	0 to −10
Mutual tolerance of lot diameter D_W (max.)	2
Roundness of diameter D_W, diameter variation in flat surface	1.0 ($L_W/D_W \leqq 6$) 1.5 ($L_W/D_W > 6$)
Tolerance of length L_W	h13
Accuracy class	Class 2

Needle rollers are separated into groupings of 2μm ranges based on the diameter of the roller and are separately packaged to maintain consistency between supplied rollers. Depending on the tolerance range, the needle rollers are classified by label colors such as red, black, and blue, and then delivered.

Bearing rollers in packages having different label colors must not be mixed.

Table 3 Diameter dimensional tolerance and classification of needle rollers

Label color	Tolerance range (μm)	Classification
Red	0 to −2	Standard
Navy	−1 to −3	
Blue	−2 to −4	
Black	−3 to −5	
White	−4 to −6	
Gray	−5 to −7	Sub standard
Green	−6 to −8	
Brown	−7 to −9	
Yellow	−8 to −10	

4. Application of needle rollers

When a full compliment needle roller bearing is made with a standard needle roller, the shaft diameter (d), the housing bore diameter (D), the circumferential clearance (Δ_C), and the radial internal clearance (Δr) are calculated from the needle roller diameter (D_W) and the number of rollers (Z) (see **Fig. 2**).

The minimum value of the circumferential clearance (Δ_C) is calculated by Equation (1). The radial internal clearance (Δr) is selected based on the shaft diameter and the usage conditions using section “E. Needle roller bearings 2.4 Solid type needle roller bearings **Table 9** (E-7)” as guidance. Full complement needle roller bearings generally require a larger radial inner clearance than a needle roller bearing with cage.

$$\Delta_C = (0.005 \sim 0.020) \times Z \text{ mm}$$
(minimum value) .... (1)

The minimum value of the housing bore diameter (D) and the maximum value of the shaft diameter (d) are calculated from Equations (2) and (3).

$$D = \frac{1}{\sin\left(\frac{\pi}{Z}\right)} \cdot \left(D_W + \frac{\Delta_C}{Z}\right) + D_W \text{ mm}$$
(minimum value) .... (2)

$$d = D - 2D_W - \Delta r \text{ mm}$$
(maximum value) .... (3)

In order to retain the needle rollers in the housing using the keystone method, the maximum value of the housing bore diameter (D) is calculated from the minimum value of the roller diameter ($D_{W\,min}$) and the number of rollers (Z) using Equation (4) (see **Fig. 3**). Factor K is shown in **Table 4**.

$$D = K \cdot D_{W\,min} \text{ mm (maximum value)} \cdots (4)$$

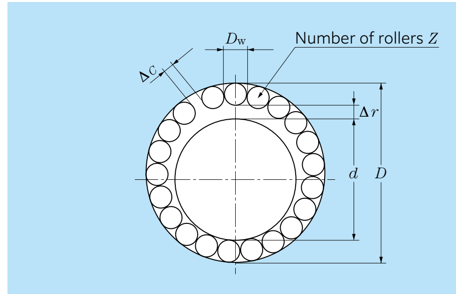

Fig. 2

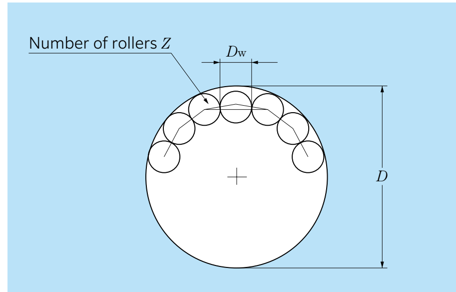

Fig. 3

Table 4 Values of factor K

Z	K	Z	K

Needle Roller Bearings

Needle Roller Bearings Contents

1. Characteristics and types of needle roller bearings

Needle roller bearing are rolling bearings which have small diameter cylindrical rolling elements whose length is relatively long compared with their diameter.

Needle roller bearings have a small cross-sectional height and have a larger load capacity and rigidity than other types of rolling bearings for their relative size. They are also suitable for oscillating motion due to their low moment of inertia. Types of needle roller bearings are shown in the table below. This catalog **provides dimension tables for the representative bearing types indicated by blue text in the table below**.

For more information about needle roller bearings, see the special catalog issued separately "**Needle roller bearings (CAT. No. 2300/E)**."

Bearing type		Type code	Shaft diameter	Page of bearing dimension table
Radial roller bearings	Needle roller bearing with cage	K, K···T2, K···S, KMJ···S, K···ZW, KV···S, KV···ZWS, K···L1	3~285	E-12~25

Note: 1. Bearings with polyamide resin cages (supplementary suffix code: T2/example: HK0408FT2) must be used at an allowable temperature of 120°C or below or 100°C or below for continuous use.
2. Bearings with an attached synthetic rubber seal and filled with grease inside (supplementary suffix code: L or LL/example: NATR20LL/3AS) must be used at an allowable temperature of -20 to 120°C or 100°C or below for continuous use.

2. Handling and accuracy of needle roller bearings

2.1 Required accuracy and surface hardness of raceway surfaces

For applications using needle roller bearings, the outer diameter of the shaft or the inner diameter of the housing or the gear is sometimes used directly as a raceway surface. **Table 1** shows the accuracy, surface roughness, and surface hardness required for raceway surfaces in order to keep radial clearance within the prescribed allowable tolerance range after needle roller bearing installation, and to ensuring high rotational accuracy. To set a surface hardness of the raceway surface from 58 to 64 HRC and obtain a sufficient load capacity, apply appropriate heat treatment to materials as shown in **Table 2**.

Depending on the usage conditions, the bearing function may not be satisfactory even with the following recommended values. If this applies, consult with **NTN** Engineering.

Table 1 Recommended accuracy of raceway surfaces

Characteristics		Shaft	Housing
Dimensional accuracy		IT5 (IT4)	IT6 (IT5)
Roundness Cylindricity (Max.)		IT3 (IT2)	IT4 (IT3)
Abutment squareness (Max.)	Radial	IT3	
	Thrust	IT5 (IT4)	
Surface roughness μm Ra		Shaft diameter ϕ80 or below: 0.2 Shaft diameter ϕ81 to ϕ120: 0.3 Shaft diameter over ϕ120 : 0.4	
Surface hardness		58 to 64 HRC	

Remarks: Accuracy in ( ) applies for high rotational accuracy.

Table 2 Materials used for raceways

Steel type	Representative example	Standard
High carbon chrome bearing steel	SUJ2	JIS G 4805
Carbon tool steel	SK85 (Former: SK5)	JIS G 4401
Nickel chrome molybdenum steel	SNCM420	JIS G 4053 (Former: JIS G 4103)
Chrome steel	SCr420	JIS G 4053 (Former: JIS G 4104)
Chrome molybdenum steel	SCM420	JIS G 4053 (Former: JIS G 4105)
Stainless steel	SUSU440C	JIS G 4303

When steel is surface-hardened by carburizing or carbonitriding, the depth from the surface to 550 HV is defined as effective case depth per JIS. The minimum value of the effective case depth is roughly estimated using formula (1).

$$Eht_{\min} \geqq 0.8D_{w}(0.1 + 0.002D_{w}) \cdots\cdots\cdots (1)$$

Where:
$Eht_{\min}$: Minimum effective case depth, mm
D_{w} : Roller diameter, mm

Needle roller bearings have low allowable misalignment because the ratio of roller length to roller diameter is high. For normal applications, bearing misalignment must not exceed the values shown in **Table 3**.

Table 3 Allowable misalignment of needle roller bearings

Bearing type	Allowable misalignment
Radial roller bearings	1/2 000
Thrust roller bearings	1/10 000

Mating part dimensions must be set so that the rolling surface does not come in contact with the recessed portion of the shaft or the chamfered area of the housing raceway surface. Contact **NTN** Engineering when dimension $A_{\min}$ (**Fig. 1**) must be confirmed.

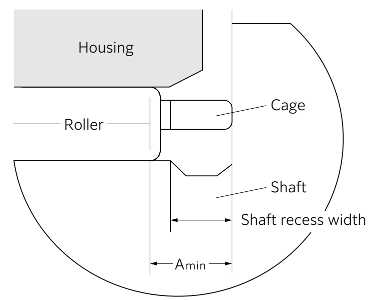

Fig. 1 Dimension $A_{\min}$

2.2 Needle roller bearing with cage

These needle roller bearings include needle rollers and cages that guide and hold the needle rollers. The structure is lightweight and compact because no inner ring or outer ring is used and the shaft and the housing are used as raceway surfaces.

Table 4 shows recommended fits for this bearing type, and **Table 5** shows the diameter dimensional tolerance and classification of needle rollers. See section 2.1 for the accuracy and surface hardness necessary for shafts and housings serving as the raceway surfaces for these bearings.

The needle roller diameter variation included in a single assembly is within 2 μm, and the standard classification shown in **Table 5** will be supplied if there is no particular designation. When two or more of the same bearings are to be used in tandem arrangement, it is necessary to use bearings having rollers of the same classification promote equal load sharing.

For caged needle roller bearings that are used for the connecting rod of small/medium reciprocating engines, see the catalog "**Needle roller bearings (CAT. No. 2300/E).**"

Table 4 Fits recommended for needle roller bearings with cage

Shaft diameter mm	Recommended fits					
	Internal clearance less than normal		Normal clearance		Internal clearance greater than normal	
	Shaft	Housing	Shaft	Housing	Shaft	Housing
Up to 80	j5	G6	h5	G6	g6	G6
80 to140	h5	G6	g5	G6	f6	G6
140 or more	h5	G6	f5	H6	f6	G6

Table 5 Diameter dimensional tolerance and classification of needle rollers

Label color	Tolerance range (μm)	Classification
Red	−0 to − 2	Standard
Navy	−1 to − 3	
Blue	−2 to − 4	
Black	−3 to − 5	
White	−4 to − 6	
Gray	−5 to − 7	Sub standard
Green	−6 to − 8	
Brown	−7 to − 9	
Yellow	−8 to −10	

When a caged needle roller bearing is used as a single body to be directly guided in the axial direction by a shaft shoulder (**Fig. 2**), any part coming into contact with the cage side surface must be sufficiently finished without burrs. For high speed or heavy load operation, the contact surface is hardened and finished by grinding.

When a cage is to be guided in the axial direction with a snap ring (**Fig. 2**), a thrust ring is used between the cage and the snap ring so that the snap ring lugs do not come in contact with the cage directly.

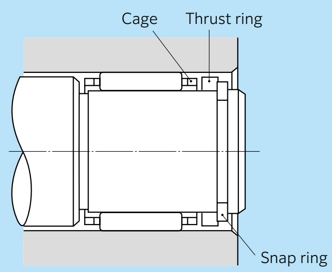

Fig. 2 Fixing using thrust ring

●Needle Roller Bearings NTN

2.3 Drawn cup needle roller bearings

The outer ring of drawn cup needle roller bearings is formed by precision drawing from a thin steel plate, and is designed to have an appropriate accuracy for its intended function when press-fit into a rigid housing.

Therefore, **it is meaningless to measure the dimensional accuracy of the bearing itself before press fitting. After pressing into a ring gage (with wall thickness of 20 mm or more) having appropriate dimensions, the bearing accuracy is evaluated by measuring the roller inscribed circle diameter (F_W) with a plug gauge or a tapered gauge**.

Recommended fits for drawn cup needle roller bearings are shown in **Table 6**, and recommended shaft and housing accuracy is shown in **Table 7**. **Tables 8.1** and **8.2** show the dimensional tolerances of the ring gauge inner diameter dimension and the roller inscribed circle diameter (F_W) with respect to the standard metric series HK and BK types and the heavy load series HMK type.

Table 6 Drawn cup needle roller bearing housing and shaft fits

Bearing type	Housing		Shaft	
	Iron-based	Light alloy	No inner ring	With an inner ring
HK, BK	N6(N7)	R6(R7)	h5(h6)	k5(j6)
HMK	J6(J7)	M6(M7)		

Table 7 Recommended shaft and housing accuracy

Characteristics	Shaft	Housing
Dimensional accuracy	IT6 (IT5)	IT7 (IT6)
Roundness Cylindricity (Max.)	IT3	IT4
Abutment squareness (Max.)	IT3	IT3
Fitting surface roughness Ra	0.8	1.6

Note: Accuracy in ( ) applies to bearings of accuracy class 5 and higher.

When a plug gauge is used for the measurement of the roller inscribed circle diameter (F_W), the dimension of the go side is the lower limit of the dimensional tolerance of the roller inscribed circle diameter, and the dimension of the no-go side is the value obtained by adding 2 μm to the upper limit of the dimensional tolerance of the roller inscribed circle diameter.

Since the outer ring is formed by a thin steel plate, **the safety factor (S_0) when the bearing is used must be $S_0 \geqq 3$ for standard specifications, and $S_0 \geqq 2$ must be maintained for the carburized/quenched specification (premium shell bearing[1]).**

1) Premium shell bearings
For details, see the special catalog issued separately "**Premium shell bearings (CAT. No. 3029/JE).**" (Suffix code F is added to the bearing number.)

Table 8.1 Accuracy of drawn cup needle roller bearings (1)

50	62	61.994	50.050	50.025

When a drawn cup needle roller bearing is to be inserted into a housing, **the marked side of the bearing must be press-fit into the appropriate position with the use of a jig.** (There is no designation for the installation direction of pre-bent specification products[1].)

The bearings must not be directly struck by a hammer when being installed. Use an installation jig like that shown in **Fig. 3**, having a mandrel equipped with an O-ring for ease of installation, should be used to ensure the bearing will not fall off or become damaged during installation.

When inserting an inner ring or a shaft into a drawn cup needle roller bearing installed in a housing, insert it straightly by aligning the central axis of the inner ring or the shaft with the central axis of the housing.

Since a drawn cup needle roller bearing is positioned by means of the housing, it is unnecessary to provide a snap ring or a shoulder. However, when a drawn cup needle roller bearing is to be press-fitted into a housing having a shoulder, it is necessary to pay attention to prevent the bearing side surface from contacting the shoulder, thereby causing deformation of the bearing.

1) Pre-bent specification
The outer ring flange is hardened on both sides by heat treating the outer ring after inserting the cage and rollers and bending the edge of the ring.
Thus, bearings can be press-fitted from any direction compared with conventional products, which required applying a jig on the outer ring marking side. (Suffix code M is added to the bearing number.)

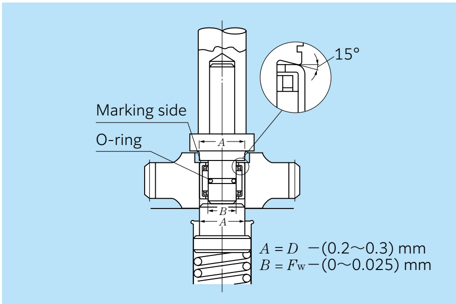

Fig. 3

2.4 Solid type needle roller bearings

These bearings have a non-separable construction held together by flanges or side plates on both sides of the outer ring, with needle rollers and cages contained within a solid (machined) outer ring. Since the outer ring is solid (machined), it has high rigidity and the bearing accuracy can be increased; therefore, the bearings are suitable for applications that require high speed, high load, and high rotational accuracy.

There are two types of solid type needle roller bearings: one having an inner ring and one having no inner ring. Bearings without an inner ring use the shaft directly as a raceway surface, and the required dimensional tolerance of the shaft diameter (raceway diameter) is as shown in **Table 9** based on required operating clearance (see **Table 1** required accuracy of other parameters). The corresponding dimensional tolerance of the housing bore is set to K7, which is widely used in general. Please consult **NTN** Engineering when setting the dimensional tolerance of the housing bore to other classes.

Table 9 Dimensional tolerance for shaft (raceway diameter)

Roller inscribed circle diameter F_w mm		Shaft tolerance class		
Over	Incl.	Internal clearance less than normal	Normal clearance	Internal clearance greater than normal
	80	k5	h5	f6
80	160	k5	g5	f6
160	180	k5	g5	e6
180	200	j5	g5	e6
200	250	j5	f6	e6
250	315	h5	f6	e6
315	400	g5	f6	d6

Tables 10.1 and **10.2** show values of the radial internal clearance of bearings with an inner ring. **Table 10.1** shows the clearance of interchangeable bearings, and the clearance values are satisfied even if the inner rings and outer rings are intermixed. **Table 10.2** shows the clearance of non-interchangeable bearings, and the clearance range is tightly controlled. Therefore, the inner rings and outer rings cannot be intermixed. The clearance codes are C2, normal, C3, and C4 from smallest to largest, and suffix code NA is added for the non-interchangeable clearance.

1) Only code "NA" is given to this type of bearings. Example: NA4920NA

When there is an oil hole on the raceway surface, **bearings should be installed such that the oil hole position is located in the non-loaded region**. A bearing with an inner ring **must be used within the allowable movement amount (s) (a state in which the rollers are within the range of the inner ring effective contact length)**. The allowable movement amount (s) is illustrated in **Fig. 4**, values are listed in the bearing dimension tables.

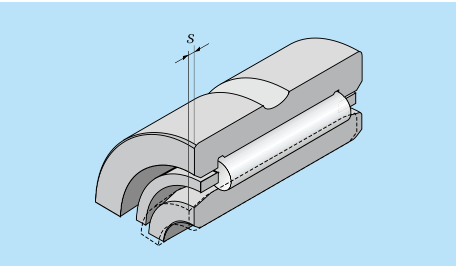

Fig. 4 Allowable movement amount (s)

2.5 Thrust roller bearing

Thrust roller bearings are bearings having a disc-shaped raceway combined with a cage-and-roller assembly having needle rollers or cylindrical rollers radially embedded, and are suitable for axial loads applied in a single direction.

Further, a shaft or housing can be directly used as a raceway surface without using a separate raceway ring. Thereby, size in the axial direction can be minimized, and lightweight and compact designs can be obtained. **Table 11** shows fits recommended for thrust roller bearings. See **Table 1** for the required accuracy of the raceway surface.

Table 11 Fits recommended for thrust roller bearings

Bearing parts			Type and class	
			Shaft diameter	Housing bore
AXK type, K811 type		Inner diameter guide	h8 1)	—
K812 type, K893 type		Outer diameter guide	—	H9 1)
WS type raceway (inner ring)			h6	—
GS type raceway (outer ring)			—	H7
Steel raceway	AS type	Shaft fixing	h10	Clearance with housing
		Housing fixing	Clearance with shaft Loose	H11

1) The guide surface is finished by grinding.

2.6 Cam follower/roller follower

A cam follower is a track roller having a stud in place of an inner ring, and the outer ring rolls on a track. It is a bearing used as an eccentric roller, a guide roller, etc., and it can have a cylindrical shape or a spherical shape for the outer ring outer diameter. Cam follower bearings are offered in both cage type and full complement designs.

When attaching a cam follower **do not strike the flange part with a hammer because sharp impact may cause cracks and rotational failure (Fig. 5)**. In addition, the oil supply hole position on the stud raceway surface of the cam follower is indicated by the **NTN** mark on the stud flange surface. **Install it by rotating the nut while the fixing the stud so that the mark (oil hole) is positioned in the non-loaded region (Fig. 6)**. The thread part may break if too much tightening torque is applied.

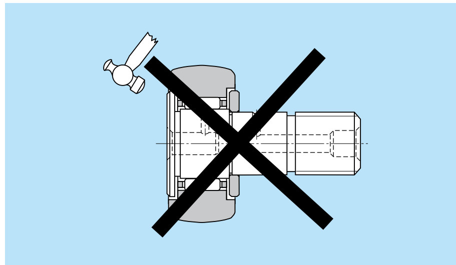

Fig. 5

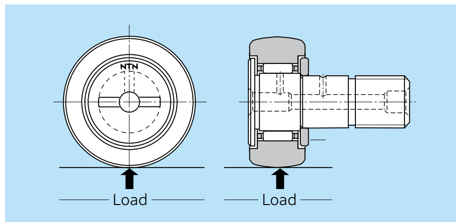

Fig. 6

A roller follower is a bearing in which the outer ring rolls on a track. As with the cam follower, there is a cylindrical shape or a spherical shape for the outer ring outer diameter, and are offered in both cage type and full complement designs. Common uses include use as an eccentric roller, guide roller, rocker arm roller, cam roller, pressure roller, etc.

A roller follower must be installed so that the oil hole is positioned in the non-loaded region because installing the oil hole position of the inner ring in the loaded region may shorten the bearing life.

Table 12 shows the radial internal clearance of cam followers and roller followers, **Tables 13** and **14** show the dimensional accuracy and recommended fits of cam followers, and **Table 15** shows the recommended fits of roller followers.

Table 12 Radial internal clearance of cam followers and roller followers

Type and class of shaft	
No inner ring	With an inner ring
k5 or k6	g6 or h6

The maximum radial load that can be statically permitted on the contact surface between the track and the track roller is referred to as the track load capacity, and the value differs depending on the hardness of the track. The track load capacity specified in the dimension table is a value considering a track hardness of 40 HRC, and the load capacity of tracks having different hardness may be obtained by multiplying the track load capacity in the dimension table by the correction coefficient G in **Table 16**. However, when the calculated track load capacity exceeds the basic static rating load C_{0r} of the bearing, the track load capacity is equal to the basic static rating load C_{0r} of the bearing.

Table 16 Correction coefficient G

Hardness (HRC)	Correction coefficient G	
	Cylindrical shape	Spherical shape
20	0.368	0.223
25	0.459	0.311
30	0.583	0.446
35	0.750	0.650
40	1.000	1.000
45	1.414	1.681
50	1.987	2.800
55	2.787	4.652

Since **NTN** cam followers and roller followers are generally installed with cantilever loading, a non-uniform load (one-sided load) may act on the bearing due to the influence of loosening of the fitting caused by continuous use. For stable operation of equipment, it is necessary to pay sufficient attention to the looseness of the fitting.

Further, lubrication is also necessary between the outer ring outer diameter surface and the track of the bearing. Even after lubrication, the bearing and the track may be damaged at an early stage when slippage occurs between the outer ring outer diameter surface and the track of the bearing due to rapid radial load fluctuation or rotational speed fluctuation during use.

For details, see the special catalog “**Needle roller bearings (CAT. No. 2300/E)**” or “**Cam follower & roller follower (CAT. No. 3604/JE)**.”

1) Smallest allowable dimension for chamfer dimension r.
2) Allowable axial movement amount of the inner ring with respect to the outer ring.
3) Largest allowable dimension for fillet radius r_a of housing and shaft.

Note: The number of inner rings (IR) is composed of the IR inner diameter dimension × outer diameter dimension × width dimension.

1) Smallest allowable dimension for chamfer dimension r.
2) Allowable axial movement amount of the inner ring with respect to the outer ring.
3) Largest allowable dimension for fillet radius r_a of housing and shaft.

Note: The number of inner rings (IR) is composed of the IR inner diameter dimension × outer diameter dimension × width dimension.

1) Smallest allowable dimension for chamfer dimension r.
2) Allowable axial movement amount of the inner ring with respect to the outer ring.
3) Largest allowable dimension for fillet radius r_a of housing and shaft.

Installation-related dimensions mm			Mass kg

1) The tolerance of outer ring outer diameter D of KR··X type and KR··XLL type having a cylindrical outer diameter surface is JIS 0 class.
2) A grease filler hole is provided only on the front surface (left side in the above drawing).

3) The allowable speed of KR··LL type and KR··XLL type with a "*" mark seal is about 10 000 min⁻¹.

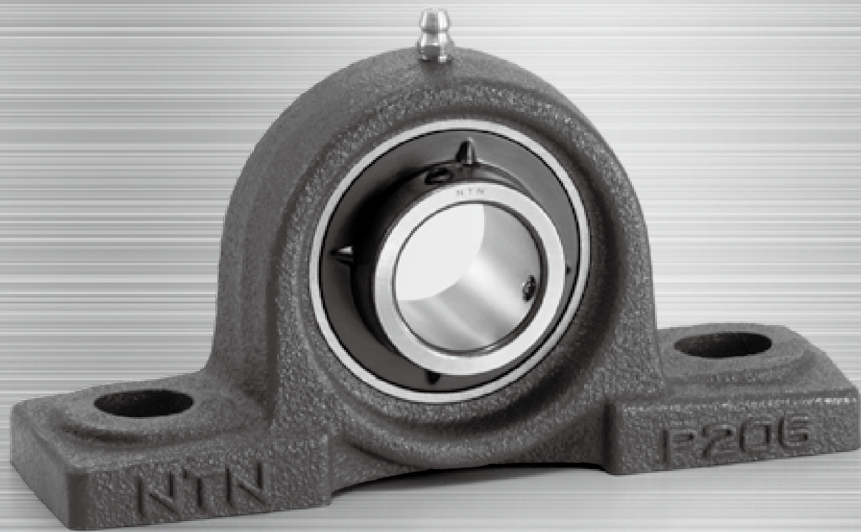
1) For bearings having a cylindrical outer ring surface, code "X" is added after the bearing number. In this case, the tolerance of outer ring outer diameter D of cylindrical bearings is JIS 0 class. Example: NUTW203X
2) Smallest allowable dimension for chamfer dimension r.

Needle Roller Bearings NTN

Bearing Units Contents

Bearing Units



1. Design features and characteristics of bearing unit

The **NTN** bearing unit is a combination of a radial ball bearing with seals and a cast iron or steel housing of various shapes. The bearing outer diameter surface and the housing inner diameter surface are spherical and have a self-aligning design.

The internal construction of the ball bearing for units uses the same steel ball and cage as the bearing series 62 and 63 of the **NTN** deep groove ball bearings. Seals consisting of an oil resistant synthetic rubber, and a **NTN** unique slinger (also referred to as a flinger) is provided on both sides.

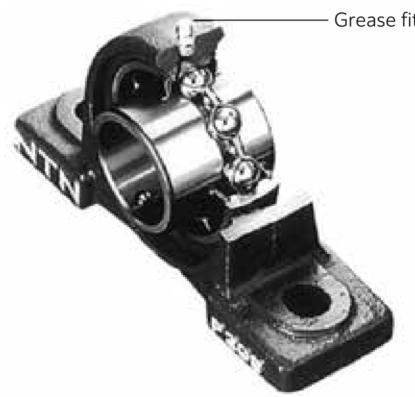
The included bearings for units are factory filled with grease and sealed, but can be re-lubricated from the grease fitting. See section “11. Lubrication” for greases used.

The ball bearings for units have a wide inner ring which depending on the type, fit to the shaft in the following ways:

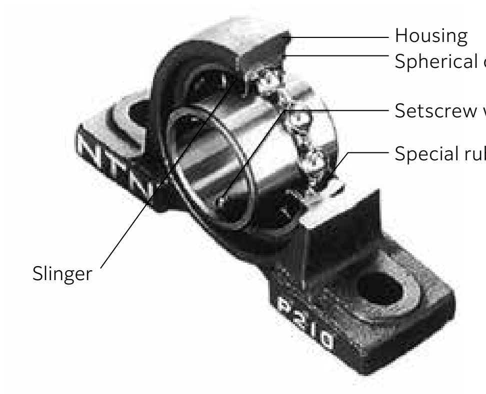
1. The inner ring is fastened to the shaft in two places by ball point setscrews.
2. The inner ring has a tapered bore and is fitted to the shaft by means of an adapter.
3. The inner ring is fastened to the shaft by an eccentric locking collar system by means of eccentric groves on the side of the inner ring and a collar.
4. The inner ring is fastened to the shaft by providing an interference fit.

For the details of **NTN** bearing units, see the special catalog “**Bearing units (CAT. No. 2400/E)**.”

NTN bearing unit with grease fitting



NTN bearing unit without grease fitting



2. Bearing unit types

Table 1 Main types of ball bearings for bearing units

Type		
UC (S) type Cylindrical bore type Setscrew type	 (F-)UC type	 UCS type
UEL (S) type Cylindrical bore type Eccentric collar type	 UEL type	 UELS type
AEL (S) type Cylindrical bore type Eccentric collar type	 AEL type	 AELS type
UK (S) type Tapered bore type Adapter type	 UK type	 UKS type
AS (S) type Cylindrical bore type Setscrew type	 AS type	 ASS type
CS type Cylindrical bore type Tight fit type	 CS···LLU type	

Table 2 (1) List of cast iron pillow bearing unit types

Housing type	Cover	UC	UEL	UK;H	AS	AEL	CS
Cast iron pillow type	None	UCP	UELP	UKP	ASP	AELP	–
	Steel	S(M)-UCP	–	S(M)-UKP	S(M)-ASP	–	–
	Cast iron	C(M)-UCP	C(M)E-UELP	C(M)-UKP	C(M)-ASP	–	–
Cast iron thick pillow type	None	UCIP	UELIP	UKIP	–	–	–
	Steel	S(M)-UCIP	–	S(M)-UKIP	–	–	–
	Cast iron	C(M)-UCIP	C(M)E-UELIP	C(M)-UKIP	–	–	–
Cast iron center height pillow type	None	UCHP	UELHP	UKHP	ASHP	AELHP	–
	Steel	S(M)-UCHP	–	S(M)-UKHP	S(M)-ASHP	–	–
Cast iron narrow width pillow type	None	UCUP	UELUP	UKUP	ASUP	AELUP	–
	Steel	S(M)-UCUP	–	S(M)-UKUP	S(M)-ASUP	–	–
Lightweight cast iron pillow type	None	–	–	–	ASPB	AELPB	CSPB
Cast iron low center height pillow type	None	UCPL	UELPL	UKPL	ASPL	AELPL	–

(Bearing type: UC, UEL, UK;H, AS, AEL, CS)

Note: 1. Type code S- is given for steel covers that open on both sides, and type code SM- is given for steel covers that close on one side.
2. Type code C- is given for cast iron covers that open on both sides, and type code CM- is given for cast iron covers that close on one side. However, in the case of cast iron covers combined with eccentric locking ring bearings, type code CE- is given for covers that open on both sides, and type code CME- is given for covers that close on one side.

Table 2 (2) List of cast iron flange bearing unit types

Housing type	Cover	UC	UEL	UK;H	AS	AEL	CS
Cast iron square flange	None	UCF	UELF	UKF	ASF	AELF	–
	Steel	S(M)-UCF	–	S(M)-UKF	S(M)-ASF	–	–
	Cast iron	C(M)-UCF	C(M)E-UELF	C(M)-UKF	C(M)-ASF	–	–
Square flange with cast iron spigot joint	None	UCFS	UELFS	UKFS	–	–	–
	Cast iron	C(M)-UCFS	C(M)E-UELFS	C(M)-UKFS	–	–	–
Round flange with cast iron spigot joint	None	UCFC	UELFC	UKFC	ASFC	AELFC	–
	Steel	S(M)-UCFC	–	S(M)-UKFC	S(M)-ASFC	–	–

	Steel	S(M)-UCT-00	—	S(M)-UKT-00	S(M)-AST-00	—
	Cast iron	C(M)-UCT-00	C(M)E-UELT-00	C(M)-UKT-00	C(M)-AST-00	—
Stretcher light groove steel frame	None	UCL-00	UELL-00	UKL-00	ASL-00	AELL-00
	Steel	S(M)-UCL-00	—	S(M)-UKL-00	S(M)-ASL-00	—
	Cast iron	C(M)-UCL-00	C(M)E-UELL-00	C(M)-UKL-00	C(M)-ASL-00	—
Stretcher groove steel frame	None	UCM-00	UELM-00	UKM-00	ASM-00	AELM-00
	Steel	S(M)-UCM-00	—	S(M)-UKM-00	S(M)-ASM-00	—
	Cast iron	C(M)-UCM-00	C(M)E-UELM-00	C(M)-UKM-00	C(M)-ASM-00	—

Note: 1. Type code S- is given for steel covers that open on both sides, and type code SM- is given for steel covers that close on one side.
2. Type code C- is given for cast iron covers that open on both sides, and type code CM- is given for cast iron covers that close on one side. However, in the case of cast iron covers combined with eccentric locking ring bearings, type code CE- is given for covers that open on both sides, and type code CME- is given for covers that close on one side.

3. Accuracy

The accuracy of **NTN** bearing units conform to JIS B1558 (Roller bearings: insert bearings and eccentric locking rings) and JIS B1559 (Roller bearings: insert bearings and steel housings).

3.1 Accuracy of ball bearings for units

Tables 3 and **4** show the accuracy of ball bearings for units.

Table 3 Tolerance values for inner rings

Unit: μm

Nominal bearing bore diameter d mm		Cylindrical bore bearings: Bearing bore diameter, All models except CS type: Mean bore diameter deviation Δ_{dmp}		Bore diameter variation V_{dsp}	CS type: Mean bore diameter deviation Δ_{dmp}		Dimensional tolerance of eccentricity amount of eccentric surface of eccentric collar type bearings Δ_{Hs}		Dimensional tolerance of inner ring width Δ_{Bs} (approx.)		Radial runout K_{ia} (approx.)
Over	Incl.	Upper	Lower	Max.	Upper	Lower	Upper	Lower	Upper	Lower	Max.
10	18	+15	0	10	0	− 8	+100	−100	0	−120	15
18 1)	31.75	+18	0	12	0	−10	+100	−100	0	−120	18
31.75	50.8	+21	0	14	0	−12	+100	−100	0	−120	20
50.8	80	+24	0	16	0	−15	+100	−100	0	−150	25
80	120	+28	0	19	0	−20	+100	−100	0	−200	30
120	180	+33	0	22	0	−25	+100	−100	0	−250	35

1) 10 mm is included in this dimensional division.
2) See the section of "6. Bearing tolerance" for the tolerance and tolerance values for tapered bores.

Table 4 Tolerance values for outer rings

Unit: μm

Nominal bearing outer diameter D mm		Mean outside diameter deviation Δ_{Dm} 1)		Radial runout K_{ea} (approx.)
Over	Incl.	Upper	Lower	Max.
30	50	0	−11	20
50	80	0	−13	25
80	120	0	−15	35
120	150	0	−18	40
150	180	0	−25	45
180	250	0	−30	50
250	315	0	−35	60

1) The lower value of the dimensional tolerance of the average outer diameter specified in the table does not apply to the distance of 1/4 of the width dimension of the outer ring side surface to the outer ring.

3.2 Accuracy of housings for units

Table 5 shows the spherical bearing seating (spherical surface inner diameter) of housings for units. For other dimensional accuracy, see the special catalog "**Bearing units (CAT. No. 2400/E)**."

Table 5 Dimensional tolerance of inner diameter of cast iron housings

Unit: μm

Nominal bore diameter of spherical bearing seating D_a (mm)		Dimensional tolerance of average inner diameter within the plane of spherical bearing seating Δ_{Dam}: Tolerance class H7		Tolerance class J7		Tolerance class K7	
Over	Incl.	Upper	Lower	Upper	Lower	Upper	Lower
30	50	+25	0	+14	−11	+7	−18
50	80	+30	0	+18	−12	+9	−21
80	120	+35	0	+22	−13	—	—
120	180	+40	0	+26	−14	—	—
180	250	+46	0	+30	−16	—	—
250	315	+52	0	+36	−16	—	—

Spherical bearing seatings with an inner diameter of 52 mm or below is finished in the tolerance class K7, 53 mm to 180 mm is finished in the tolerance class J7, and 181 mm or above is finished in the tolerance class H7.
The casting indication of "J" is being abolished since 2000.

3.3 Bearing internal clearance

The standard internal clearance of ball bearings used in bearing units is CN (see Technical Explanation 8 **Table 8.8**). However, for the values of CN clearance of tapered bore type bearings, the values of C3 clearance of deep groove ball bearings is applied.

4. Allowable speed

The allowable speed of bearings for units that allows safe long operation is restricted by the bearing dimensions, loads, and circumferential speed of the seal contact lip. **Fig. 1** shows the allowable speed that considers these factors. When higher speed is necessary, use a bearing unit that uses a non-contact type shield. Consult with **NTN** Engineering for additional details.

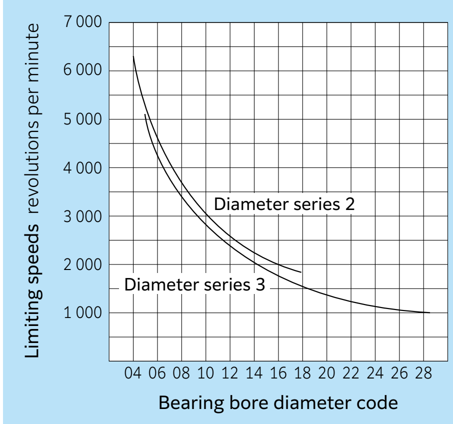

Fig. 1 Allowable speed of ball bearings for units

5. Lubrication

NTN bearing units are factory filled with an appropriate amount of grease.

The grease amount necessary for lubrication is very small in general, and the grease amount of **NTN** bearing units is about 1/2 to 1/3 of the bearing internal free space.

The grease must be filled until a small amount of grease is discharged to the entire circumference between the bearing outer ring inner diameter and the slinger outer diameter.

Rough standard of the amount of pressure required to insert grease: 1 to 3 MPa

6. Housing strength

The static breaking strength of housings for units differs depending on the housing type and load characteristics. The pillow block type unit is originally designed based on the use of a downward load. For other types of loading, please consult **NTN** Engineering.

Table 6 and **Figs. 2** and **3** show approximate values of average static breaking loads by the load direction of pillow unit housings. Consult **NTN** Engineering for the strength of other types of housings.

The allowable load of unit housings can be obtained from the static breaking load and the safety factor S_0 shown in **Table 7** from the formula below.

$$P_0 = \frac{P_{st}}{S_0}$$

P_0 : Allowable load of housing, N

P_{st} : Static breaking strength of housing, N

S_0 : Safety factor

Table 6 Static breaking load of pillow type housing

Number	Downward load kN	Number	Downward load kN

FCD450	Ductile cast iron	4	6	10	15

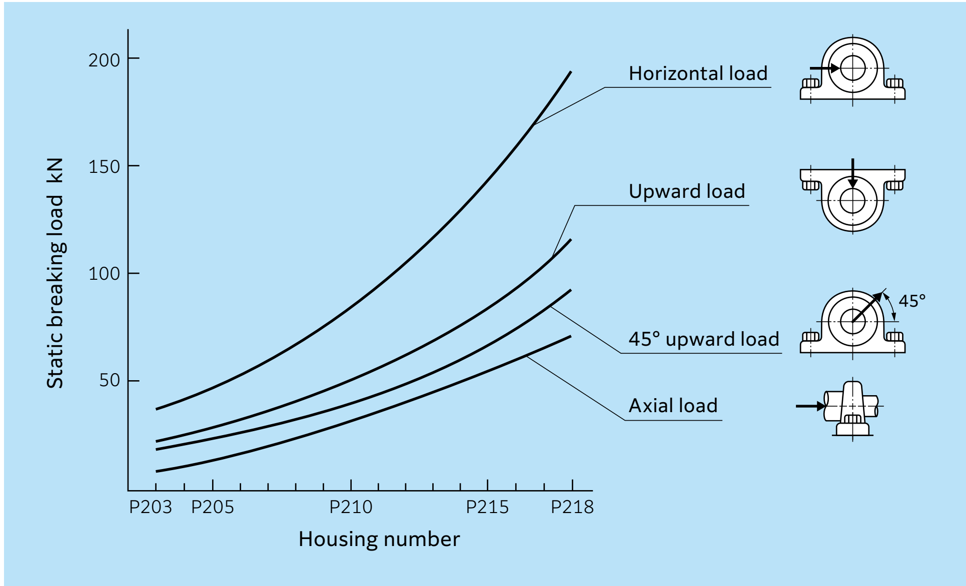

Fig. 2 Static breaking load of P2 type

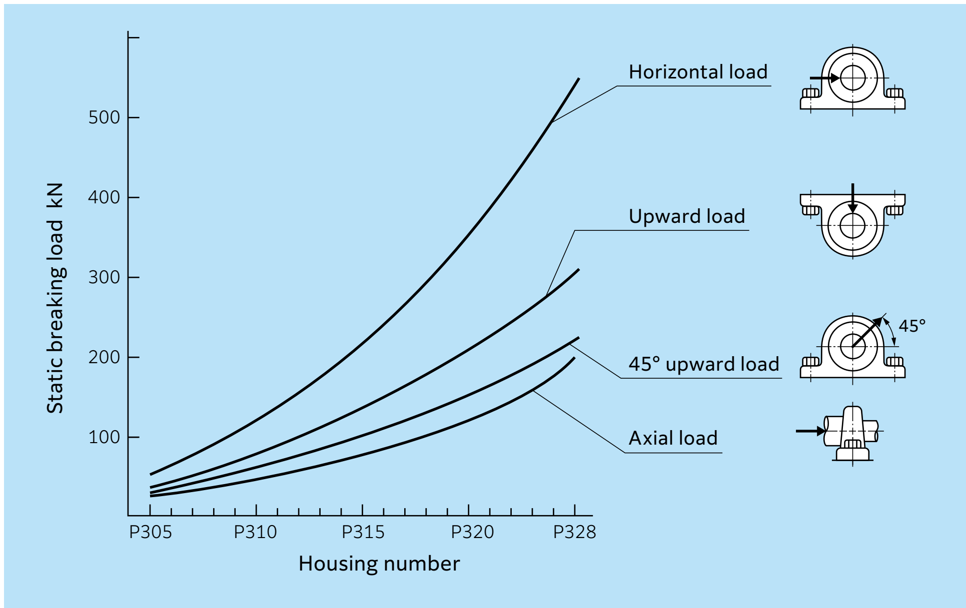

Fig. 3 Static breaking load of P3 type

7. Alignment allowance

The alignment allowance between the housing attachment surface and the shaft must be within 1/30 (1/60 for the narrow width outer ring type) due to grease channel alignment considerations. The alignment allowance of units with a cover differs depending on the cover seal, so please consult **NTN** Engineering.

8. Recommended bearing fits

Shafts used for **NTN** bearing units are not required to be highly precise, but it is desirable that the shaft is not bent or damaged.

When a bearing unit of a set screw type is to be used under a general use condition, the fitting between the inner ring and the shaft normally should be a loose fit for the assembly convenience. The appropriate values of the dimensional tolerance of the shaft are shown in **Fig. 4**.

In the case of the adapter sleeve type, since the shaft is fastened with a sleeve, the dimensional tolerance of the shaft can be h9 under a general use condition.

As with the set screw type, for the eccentric color type under a general use condition, a loose fit is generally used for the fitting between the inner ring and the shaft for the assembly convenience. For the dimensional tolerance of the shaft, values indicated in **Fig. 5** are appropriate.

According to the use condition, when a tight fit is to be adopted, proper installation methods shall be used and the inner ring side face shall not be struck directly to facilitate installation.

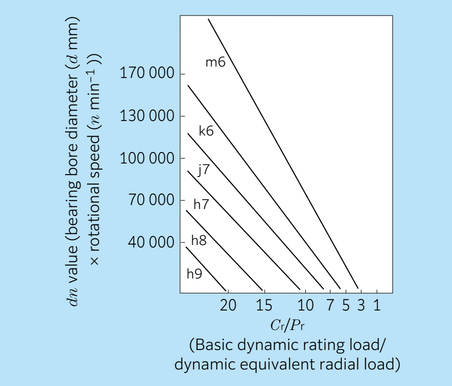

Fig. 4 Dimensional tolerance of setscrew type shaft

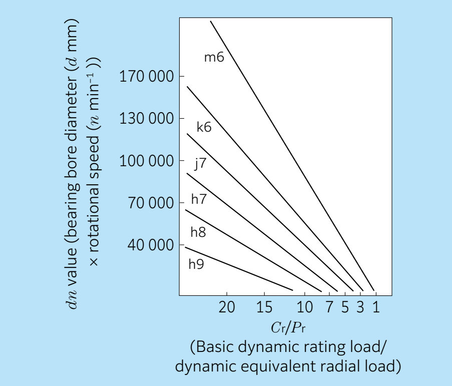

Fig. 5 Dimensional tolerance of eccentric collar type shaft

9. Recommended torque of setscrew

When bearing units of the set screw type or a eccentric collar type are to be attached to a shaft, the fastening torque shown in **Tables 8** and **9** is used as a rough standard. For fastening, the two setscrews are alternately and uniformly fastened. For the details of unit attachment, see the special catalog "**Bearing units (CAT. No. 2400/E)**."

Table 8 Recommended fastening torque of setscrews

Applied unit bearing number			Setscrew nominal dimension		Recommended setscrew fastening torque N·m

1) Spherical graphite cast iron bearings are also available based on request. In this case, a supplementary suffix "N1" is added after the unit number. **Example:** UCP320N1
2) The unit numbers indicate the oil-free type, and supplementary suffix "D1" is added after the number for the oil feeding type.

1) Spherical graphite cast iron bearings are also available based on request. In this case, a supplementary suffix "N1" is added after the unit number. **Example: UKP310N1; H2310X**
2) Unit numbers with the suffix "X" signify narrow slit type adapters, and use washers with straight inner tabs.

1) Spherical graphite cast iron bearings are also available based on request. In this case, a supplementary suffix "N1" is added after the unit number. **Example: UCF210N1**
2) The unit numbers indicate the oil-free type, and supplementary suffix "D1" is added after the number for the oil feeding type.

1) Spherical graphite cast iron bearings are also available based on request. In this case, a supplementary suffix "N1" is added after the unit number. **Example: UCFC210N1**
2) The unit numbers indicate the oil-free type, and supplementary suffix "D1" is added after the number for the oil feeding type.

1) Spherical graphite cast iron bearings are also available based on request. In this case, a supplementary suffix "N1" is added after the unit number. **Example: UCFL215N1**
2) The unit numbers indicate the oil-free type, and supplementary suffix "**D1**" is added after the number for the oil feeding type.

1) Spherical graphite cast iron bearings are also available based on request. In this case, a supplementary suffix "**N1**" is added after the unit number. **Example: UCT320N1**
2) The unit numbers indicate the oil-free type, and supplementary suffix "**D1**" is added after the number for the oil feeding type.

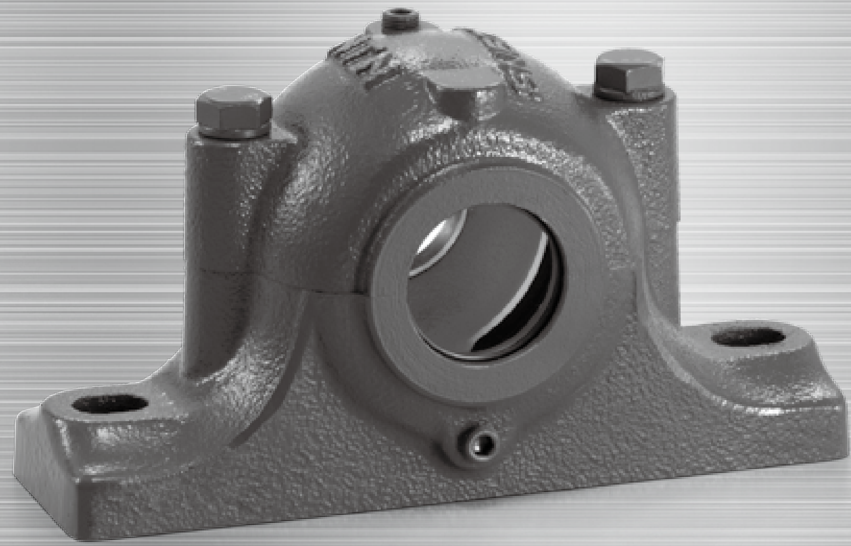
Plummer Blocks



Plummer Blocks Contents

1. Design features and characteristics

The **NTN** plummer blocks are housings for spherical roller bearings and self-aligning ball bearings. The standard housing is gray cast iron, while spheroidal graphite cast iron (ductile cast iron) and cast steel, are also available depending on the application.

The housings can incorporate rubber seals, felt seals, or labyrinth seals depending on the application. Grease and oil are both available for lubrication.

This catalog includes dimension tables of representative shapes indicated by blue characters in “2. Plummer block types and characteristics.”

For the details on **NTN** plummer blocks, see the special catalog “**Plummer blocks (CAT. No. 2500/E)**.”

Plummer block types			Shaft diameter mm	Page of bearing dimension table
Split type	SN type		25～140	G-14～25, G-30～31
	SD type		150～300	G-26～29, G-32～35
	SBG type		55～180	—
Single type	SV type		20～300	G-36～43
	VA type		50～100	—

2. Type

Type — Split type

SN type (standard type)

SN5 SN2
SN6 SN3
S6 S3
SN30
SN31

Lubricant: grease
Seal: rubber seal

- SN5 and SN6 are the most general types that are specified in JIS, ISO, and DIN, and widely used in the world.
- SN30 and SN31 are a medium size and can be applied when the bearing diameter is large.
- A tapered bore bearing (with adapter) is used.

SNZ type (stepped bore type)

SNZ2
SNZ3
SZ3

Lubricant: grease
Seal: rubber seal

- This type of plummer block is SN5, SN6, and S6 types having a large aperture on one side.
- Cylindrical bore bearings are attached with nuts and washers.

SN type (high strength type)

SN5··F SN2··F
SNZ2··F
SN6··F SN3··F

Lubricant: grease
Seal: rubber seal

- The recess at the bottom part is made small to increase the strength of the plummer block.
- The plummer block has same dimensions as SN5, SN6, and S6 types except the bottom shape.
- A tapered bore bearing (with adapter) is used.
- There is no mounting bolt hole.

SD type (standard type and large bore type)

SD5··(G) SD2··D(G)
SD6··(G) SD3··D(G)
SD30··(G)
SD31··(G)
SD33··(G)
SD34··(G)

Lubricant: grease or oil
Seal: double rubber seal

- Used for heavy loads with large self-aligning roller bearings.
- There are types for the floating side and the fixed side (G).
- A tapered bore bearing (with adapter) is used.
- There are four mounting bolt holes.

SD type (stepped bore type)

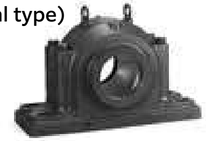
SD2··(G)
SD3··(G)
SD35··(G)
SD36··(G)

Lubricant: grease or oil
Seal: double rubber seal

- Used for heavy loads with large self-aligning roller bearings.
- This type of plummer block is SD5(G) and SD6 (G) types having a large aperture on one side.
- Cylindrical bore bearings are attached with nuts and washers.

Type — Split type

SD type (labyrinth seal type)



SD31··TS(G)
SD32··TS(G)

Lubricant: grease or oil
Seal: Labyrinth seal

- Used for heavy loads with large self-aligning roller bearings.
- Suitable for high speed rotation because the sealing device for labyrinth seals is adopted.
- Used for both oil lubrication and grease lubrication because an oil sump is provided in the housing.

Type — Single type

SV type (standard type)

SV5
SV6
SV30

Lubricant: grease
Seal: rubber seal

- The plummer block main body is a single type and has higher accuracy compared with the divided type.
- Applied to tapered bore bearings.

SV type (stepped bore type)

SV2
SV3
SV35

Lubricant: grease
Seal: rubber seal

- This type of plummer block is SN5 and SN6 types having a large aperture on one side.
- Cylindrical bore bearings are attached with nuts and washers.

VA type (narrow attachment width type)

VA5

Lubricant: grease
Seal: oil seal

- Applied to tapered bore bearings.
- Mounting bolt holes are provided at the bottom.

3. Plummer block numbers

A plummer block number indicates the type, structure, and consists of basic numbers followed by supplementary codes.

SD 5 34 B4 M3 D3 N L5

Basic number

1) Plummer block type codes
- SN (S) : divided, standard type
- SNZ : divided, standard type, different aperture type
- SD : divided, for heavy loads, with double seal
- SV : single type

2) Plummer block dimension array codes
- 5, 6, 30, 31, 33, 34 : Tapered bore bearing
- 2, 3, 35, 36 : Cylindrical bore bearing

3) Bore diameter code
- Bore no. of bearing used: 05…22…

Supplementary codes

4) Dimensions of bottom shape and mounting bolt hole
- F: small bottom recess without bolt hole
- B1…Bn: different shape and dimension from standard

5) Shaft end shape
- M3: one aperture part is embedded into the seal part
- M2: one aperture part has an iron plate attached to the end surface

6) Aperture part
- Dn: different shape and dimension from standard

7) Housing material
- N : cast steel
- N1: spheroidal graphite cast iron (ductile cast iron)

8) Lubrication
- L5: standard oil filler plug and oil drain plug are attached
- L1: standard grease nipple and oil drain plug are attached

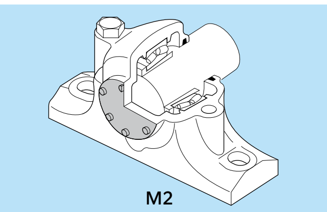
For order

The plummer block numbers do not include additional parts. Therefore, please order any necessary parts with their numbers.
(Example)

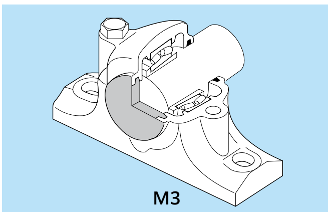
SN506	1206K	H206X	SR62×7	ZF6
Plummer blocks	Rolling bearings	Adapter	Positioning wheel (fixed side only)	Rubber seal

Article

For shaft ends, a plummer block having a non-penetrating aperture on the shaft end side (outer side) is generally used.
There are two types shown below.



M2



M3

4. Accuracy

4.1 Accuracy

Regarding the accuracy of **NTN** plummer blocks, the divided types conform to JIS B 1551 and the single types to The Japan Bearing Industrial Association (BAS) 188. The dimensional tolerances are shown in the table below.

Table 1: dimensional tolerances of bearing seating bore diameter, width, and center height
Table 2: dimensional tolerances of length of castings (cast parts such as bases and bolt holes)

Table 1 Dimensional tolerance of plummer blocks

Unit: mm

<table>
<tr><th colspan="4">Divided type</th><th colspan="6">Single type</th></tr>

Table 2 Dimensional tolerance of length of castings

Unit: mm

Size of castings (mm)				
120 or below	121 to 250	251 to 400	401 to 800	801 to 1600
±1.5	±2.0	±3.0	±4.0	±6.0

4.2 Machining accuracy of mounting bolt seating end surface

When a large horizontal load is to be applied on a plummer block, the fastening force of the mounting bolts cannot reliably secure the plumber block alone; therefore, the housing base should abut a fixed surface. In this case, it is effective to use a plummer block with a machined vertical face that comes in contact with the fixed abutment surface.

Seating length L of a plummer block having a machined mounting bolt seating end surface is smaller than the standard dimension by the machining allowance shown in **Table 3** and becomes L' (see **Fig. 1**). **Table 4** shows the dimensional tolerance of L'.

Table 3 Machining allowance Unit: mm

Plummer block nominal dimension	Machining allowance $L-L'$	Surface finish roughness
All types All sizes	5	12.5*Ra*

Table 4 Tolerance of dimension L' after machining of mounting bolt seating end surface Unit: mm

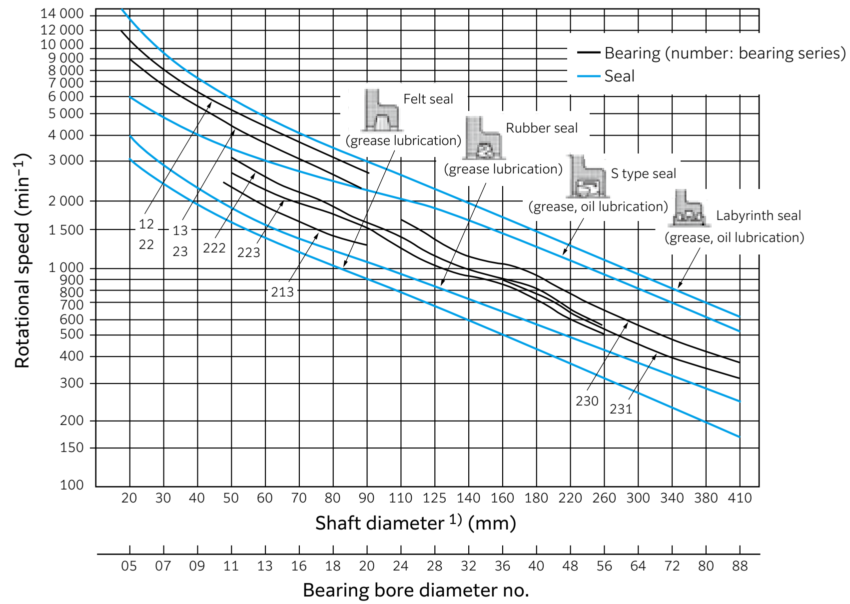
6. Allowable speed

The allowable speed of plummer blocks differ by seal types. In the case of a contact seal, the allowable speed is restricted by the allowable peripheral speed of the seal. **Fig. 2** shows a rough standard for selecting the peripheral speed of seals.



1) The allowable speed of the seal of cylindrical bore bearings is obtained by the shaft diameter of the seal contact part. The allowable speed of seals is indicated by the rotational speed of shafts.

Fig. 2 Allowable speed of bearings and seals

7. Sealing device

External seals have two main functions: to prevent lubrication from leaking out and to prevent dust, water, and other contaminants from entering the bearing.

The sealing device must be selected with the following in consideration: the type of lubricant (oil or grease) and seal peripheral speed.

A rubber seal or a felt seal is used for the contact type, and a labyrinth seal is used for the non-contact type. There are also special seals suitable for other conditions including heavy contamination.

7.1 Contact seal

(1) Rubber seal (Fig. 3)

Since rubber seals are mainly used for grease lubrication, a rough standard for the peripheral speed is 5 to 6 m/s.

Nitrile rubber is generally used for the rubber seal material, and materials shown in **Table 6** are used depending on the ambient temperature.

(2) Felt seal (Fig. 4)

Felt seals are interchangeable with rubber seals, but the use is limited to grease lubrication.

Felt seals are unsuitable for environments with a large amount of dust or high humidity, and a rough standard for the peripheral speed is 4 m/s. The seal is also convenient because it can be cut and embedded separately into the seal grooves at the upper and lower parts of a plummer block.

(3) S type seal (Fig. 5)

The S type seal has excellent sealing performance and can be used for grease and oil lubrications. Plummer blocks with special specifications are used.

A rough standard for the peripheral speed of S type seals is 10 to 12 m/s. The shaft roughness and hardness of the seal contact area especially needs attention.

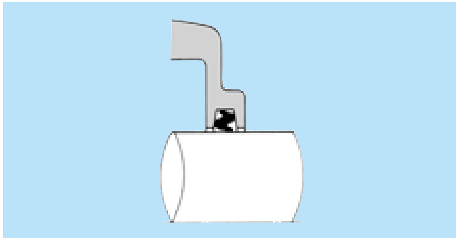


Fig. 3 Rubber seal

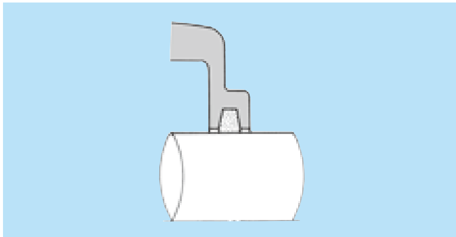

Fig. 4 Felt seal

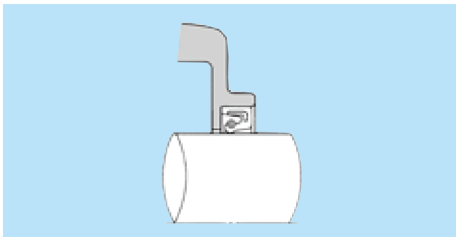

Fig. 5 S type seal

Plummer Blocks NTN

Table 6 Rubber seal types and characteristics

Seal material	Abrasion resistance	Oil resistance	Acid resistance	Alkali resistance	Water resistance	Allowable temp rough standard (°C)	Characteristics
Nitrile rubber (NBR)	◎	◎	○	○	○	−25 100	The material has resistance to most oils and has good abrasion resistance; therefore, it is the most used oil seal material. The material can be used for most conditions of general machines.
Acrylic rubber (ACM)	◎	◎	△	×	△	−15 130	The material has good heat resistance and oil resistance but poor alkali resistance and water resistance; therefore, the application is limited.
Silicone rubber (VMQ)	○	○	△	×	○	−50 220	The material has good heat resistance and cold resistance but cannot be used for spindle oil and oil containing an extreme pressure additive.
Fluorinated rubber (FKM)	◎	◎	◎	△	○	−10 220	The material is not affected by most oils and chemicals. The material has well-balanced characteristics and can be used in a wide range of applications; therefore, it is the best oil seal material.

◎ : Good, ○ : Fair, △: Slightly poor, × : Poor (cannot be used)

7.2 Non-contact seal

(1) Labyrinth seal (Fig. 6)
The labyrinth seal is a seal type that uses a labyrinth ring at the aperture part of a plummer block.

The labyrinth ring is used with a shaft loose fit (h9) and attached with an O ring to allow easy attachment and allow for expansion and contraction of the shaft.

The labyrinth seal has excellent sealing performance and can be used for grease and oil lubrications.

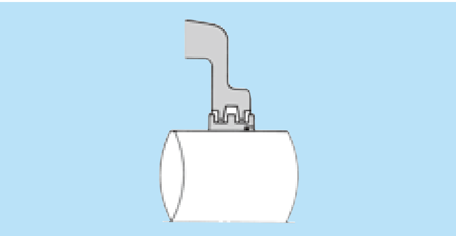

Fig. 6 Labyrinth seal

(2) Special labyrinth seal (Fig. 7)
The special labyrinth seal shown in the figure is especially effective for environments with a large amount of contamination such as dirt and sand.

Plummer blocks using this seal have special specifications, so consult with **NTN** Engineering.

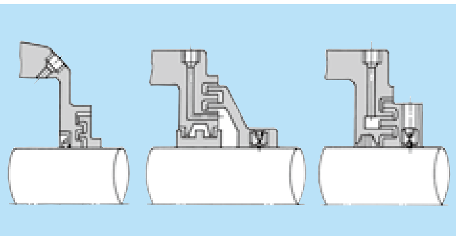

Fig. 7 Special labyrinth seal

(3) Shaft design criteria for seal attachment part (Table 7)
The hardness and roughness of shafts to be attached with seal significantly influences the sealing performance; therefore, the design criteria shown in the table must be followed.

Table 7 Shaft design criteria

Item	Design criteria	Article
Hardness	30 to 40 HRC	
Roughness *Ra*	0.8	It is preferable to grind the finish surface without feeding.
End surface chamfer	The shaft end to be inserted with a seal must be tapered, and the corner part must be rounded.	15~30° Round the corner.

7.3 Combination seal (Fig. 8)

The combination seal is a sealing device having a rubber seal and a labyrinth seal combined to the aperture part of a plummer block. It is used for environments with a large amount of dirt and foreign materials.

Filling the labyrinth voids with grease further improves the sealing effect.

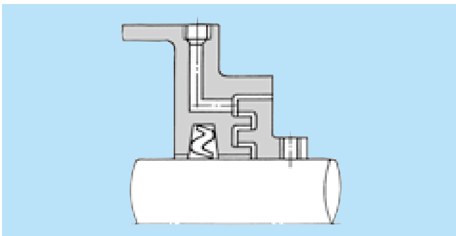

Fig. 8 Combination seal

8. Strength

The breaking strength of plummer blocks differ by the plummer block type, the characteristic and direction of the load to be applied, and is influenced by the flatness of the mounting surfaces. **Fig. 9** and **Fig. 10** shows the general fracture loads of static breaking strength of SN5 and SN6 (S6) series gray cast iron plummer blocks.

The downward breaking strength is about twice the horizontal breaking strength, and the axial breaking strength is about half of the horizontal breaking strength.

When selecting plummer blocks, consider the safety factor shown in **Table 8**. The surface to be attached with a plummer block must be flat without backlash.

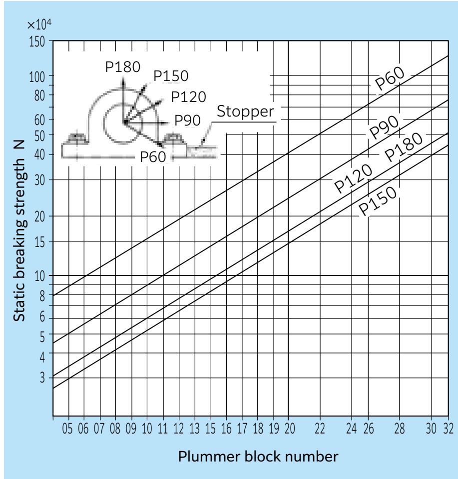

Fig. 9 Static breaking strength of SN5 series

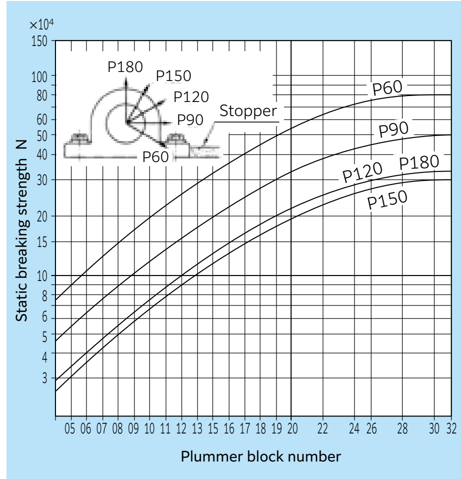

Fig. 10 Static breaking strength of SN6 series

Table 8 Safety factor of casting plummer block

Types of load	Static load	Repeated load	Alternating load	Impact load
Safety factor	4	6	10	15

For horizontal and axial loads, the base end surface needs to abut a fixed surface.

For places with especially large impact loads or when plummer block damage may result in serious accidents, plummer blocks made of materials other than gray cast iron such as cast steel or spheroidal graphite cast iron are available. Please consult **NTN** Engineering.

Plummer Blocks

1) The stabilizing ring indicates the outer diameter and width dimension.
2) Dimension Y indicates the reference dimension from the shaft center to the end in the case of the shaft end shape.
Note: 1. **SN524** or larger plummer blocks are provided with a lifting eye bolt.

1) Dimension g indicates the bearing width dimension of the floating side. The fixed side (code **G**) is larger than the bearing width dimension by 0.5 mm.
2) Dimension Y indicates the reference dimension from the shaft center to the end in the case of the shaft end shape.

1) The stabilizing ring indicates the outer diameter and width dimension. 2) Dimension Y indicates the reference dimension from the shaft center to the end in the case of the shaft end shape.
Note: 1. SN3028 or larger and SN3126 or larger plummer blocks are provided with a lifting eye bolt.

Note: 2. Dimension x applies to plummer block numbers using one stabilizing ring and indicates the value of deviation from the bearing center to the plummer block center. The value is ½ of the width dimension of the stabilizing ring.

Plummer Blocks

1) SD3068, SD3072, and SD3076 have the same dimensions as SD3368, SD3372, and SD3376. Therefore, when these models are necessary, select "SD3368, SD3372, and SD3376."
2) Dimension g indicates the bearing width dimension of the floating side. The fixed side (code G) is larger than the bearing width dimension by 0.5 mm.
3) Dimension Y indicates the reference dimension from the shaft center to the end in the case of the shaft end shape.

1) SD3168 has the same dimensions as SD3468. Therefore, when this model is necessary, select "SD3468."
2) Dimension g indicates the bearing width dimension of the floating side. The fixed side (code G) is larger than the bearing width dimension by 0.5 mm.
3) Dimension Y indicates the reference dimension from the shaft center to the end in the case of the shaft end shape.

1) The stabilizing ring indicates the outer diameter and width dimension.
2) Dimension Y indicates the reference dimension from the shaft center to the end in the case of the shaft end shape.
Note: 1. SV520 or larger plummer blocks are provided with a lifting eye bolt.

1) The stabilizing ring indicates the outer diameter and width dimension.
2) Dimension Y indicates the reference dimension from the shaft center to the end in the case of the shaft end shape.
Note: 1. SV220 or larger plummer blocks are provided with a lifting eye bolt.

Note: 1. Dimension series 22, 23, and 24 are double row bearing series. For double row bearings, d2 becomes the nominal bearing bore diameter.
2. For the outer diameter of the shaft raceway washer and the inner diameter of the housing raceway washer, see the dimension table of thrust bearings.

[How to read the table] If for example you want to convert 10 kgf to N, find "10" in the middle column of the first set of columns. Look in the N column directly to the right of "10," and you will see that 10 kgf equals 98.066 N. Oppositely, to convert 10 N to kgf, look in the kgf column to the left of "10" and you will see that 10 N equals 1.0197 kgf.

1kgf=9.80665N
1N=0.101972kgf

[How to read the table] If for example you want to convert 10 kg to lb, find "10" in the middle column of the first set of columns. Look in the lb column directly to the right of "10," and you will see that 10 kg equals 22.046 lb. Oppositely, to convert 10 lb to kg, look in the kg column to the left of "10" and you will see that 10 lb equals 4.536 kg.

1kg = 2.2046226 lb
1lb = 0.45359237 kg

[How to read the table] If for example you want to convert 10°C to °F, find "10" in the middle column of the first set of columns. Look in the °F column directly to the right of "10," and you will see that 10°C equals 50.0 °F. Oppositely, to convert 10°F to °C, look in the °C column to the left of "10" and you will see that 10°F equals -12.2°C.

[Conversion formula]

$°C = \frac{5}{9}(°F-32)$

$°F = 32 + \frac{9}{5}°C$

Appendix table-16: Greek alphabet list

Roman type (upright)	Italic type (slanted)		Name
Upper case	Upper case	Lower case	
Α	A	α	Alpha
Β	B	β	Beta
